INDEX.

List of sub-headings:

Authors.
Bankruptcy Proceedings.
City Notes.
Contracts Closed and Open.
Correspondence.
Electricity (Supply) Bill.
Institution Notes.
Legal.
Lighting and Power Notes.
Liquidations.
New Companies.
New Electrical Devices, Fittings and Plant.
Obituary.
Official Returns.
Parliamentary Notes.
Radio Notes.
Railway Notes.
Reviews.
Selected Radio-Telephone Apparatus.
Telegraph Notes.
Telephone Notes.
Tramway Notes.

A.C.-d.c. converter, An, 933
Accident, 425
Accident at Barking power station, The, 108
Accident prevention, 184
Accidents, London street, 625
Accountants' Conference, Municipal; The finance of electricity supply, 981
Accounts, Electrical traders', by S. H. Withey, 207
Accumulator components, Standard, 792
Accumulator Manufacturers' Association—Annual dinner, 342, 395
Accumulator, The Ruths steam, by A. J. T. Taylor, 807
Accumulator, The Tungstone, 78
Accumulator vehicles, French trials of, 506
Acts extended, Trade Facilities, 298
Admiralty electrical engineers' pay, 295
Advertisement competition, The ELECTRICAL REVIEW, by J. W. Beauchamp and L. L. Robinson, 244
A.E.G. in Mexico, The, 52
A.E.G. report, The, 459
Aerials, Radio-receiving, by P. D. Tyers, 490
A.E.U. and the Industrial Alliance, The, 132
Agricultural electrical machinery, by R. B. Matthews, 569
Agricultural electricity in Germany, 118
Agricultural motors in France, Standardisation of, 627
Agriculture, Electricity in, 244, 406, 877
Agriculture in Belgium, Electricity in, 386
Air transport services, 771
Aircraft navigational aids, 771
Aircraft, Radio on, 64, 238, 414
"All-electric" comparison, An, 303
"All-electric" experiment at Birmingham, An, 4, 63
All-electric house and showroom, New, 216
All-electric house developments, 251
All-electric house, Fuel economy and the, by E. W. Dickinson, 208
All-electric houses at Salford, 506
Alloy steel, A new, 747
Alternating-current link, An, 625
Alternating current on the electrolytic corrosion of iron, The influence of, by Prof. A. J. Allmand and R. H. D. Barklie, 637
Alternating-current rectification, High pressure, 779
Alternator protection, On determining the value of earthing resistances for, by B. Nuttall, 822, 877
Altitude on electrical installations, The effect of, 64
Aluminium production, 16
Amalgamated Engineering Union, The, 913
America, A Japanese in; 14
America, Electrical household activity in, 189
America, Electrical regrigeration in, 801
America, German loans in, 257
America, Strike news in, 877
America, The International Electrotechnical Commission in, by "Pheidippides," 695, 738, 780, 825
American boiler company's purchases, 96
American electric lamp developments, 667
American Electric Truck Show, 771
American electrical vehicle exports, 50
American electrical leader dissatisfied, An, 802
American loan for Italian electrical enterprises, 296
American power merger, Large, 176
American power scheme for Europe, 177
American radio industry, The, 536
American sales in England, 258
American view, An, 135
"Americanisation" of Canada, The, 133
Amplifiers, The performance of radio, by H. A. Thomas, 73
Ancient and modern methods, 64
Ancient buildings, Modern lighting in, 19
Anglo-Greek electricity scheme, An, 258
Appliance sales by electricity suppliers, 178
Arc welding a bridge, 27, 963
Arc welding, Atomic hydrogen, 627
Arc welding of cast-iron, The metallic, by P. L. Roberts, 93
Arc-welding plant contract, An, 258
Architect or building contractor, Electrical work for new buildings: 767
Architect, The electrical industry and the, by G. B. Imrie, 396
Argentina, Electrical machinery for, 539
Argentina, Hydro-electric power in, by P. F. Martin, 128
Argentina, Petrol-electric 'buses in, 627
Argentina, Tramway extensions in, 335
Argentina's electrical imports, 176
Argentine company, New, 912
Argentine electrical market, The, 53
Argentine, Water power in the, 910
Artificial daylight, by W. J. Jones, 906
Association of Consulting Engineers, 920
Association of Mining Electrical Engineers, 303, 839
Association of Municipal Electrical Engineers (South Africa), The, 830
Association of "Old Cromptonians," 964
Association of Special Libraries and Information Bureaux, 469
Atlantic cable, A link with the, 802
Atlantic City, The N.E.L.A. Convention at, by "Pheidippides," 867
Atomic hydrogen arc welding, 627
Audiophone, The, 578
Australia, British traders in, 872
Australia, Engineering conference in, 147
Australia, Municipal trading in, 419, 501, 739
Australia, Research in, 586
Australia, Standardisation in, 712
Australia, The 44-hour week in, 257, 698
Australia, The Yallourn scheme, 801
Australian companies, New, 216, 256, 456, 539, 741
Australian Customs tariffs, 255, 416, 501, 538, 789
Australian duty on radio valves, 831
Australian duty, Remission of, 176
Australian electrical development, A handicap to, 831
Australian electrical industry, 537
Australian industrial progress, 83, 112
Australian industry and tariffs, by G. A. Julius, 715
Australian plant for Sydney, 498, 580
Australian protection, Views on, 872
Australian Radio Exhibition, 456
Austrian electrical syndicate, An, 258
Austrian electrification, League's assistance in, 912
Austrian engineering industry, Conditions in the, 418
Austrian loan in Switzerland, 419
Austrian Power Exhibition, 457

Authors—

Allmand, Prof. A. J., and R. H. D. Barklie, The influence of alternating current on the electrolytic corrosion of iron, 637

New Electrical Devices, Fittings and Plant —

Actino-therapy lamps, 38
Adapter, A two-service, 634
Agricultural electric motor outfit, 155
Batten holder, A new, 115
Battery charger, An improved, 397
Boiler meter, An improved, 38
Bracket, An electric light, 155
Cable-handling pole, A new h.p., 849
Car-lighting fitting, A, 761
Charging resistance, A new, 598
Circuit breakers, Improved, 440
Coal-cutter protection, An improved, 235
Coal dryers, Vertical gravity, 980
Conduit fitting, An improved, 155
Cooker, A new, 517
Cooker, A novel electrical, 155
Cooker, An improved electric, 481
Cooking, Induced-current, 480
Copper tungsten electrode, A, 815
Current calculator, An automatic, 275
Dial gauge, A low-pressure, 634
"Domestic" electric water heater, The, 761
Duplicator, An improved, 38
"Electrocyclette" two-seater car, 981
Electro-magnetic fuel pump, An, 155
Flexible cord, An improved, 481
Food trolley, An electrically-heated, 481
G.E.C. motor starters, New, 275
General-utility tool, An electric, 517
Generating plant, A small, 480
Hammer, An electric, 235
"Heatrae" electric water heater, 761
Hole cutter, An improved, 235
Igniter, An emergency, 440
Iron, An improved electric, 598
Iron with damping device, An electric, 849
Lampholder, A solid-contact, 598
Lamp lock, A new electric, 155
Lawn mower, An electric, 115
Lifting equipment, Portable, 814
Lighting fitting, A new, 440
Lock nut, A novel, 634
Low-c.p. lamp, A, 397
Low-speed worm-geared motors, 849
"Magnetic" tee square, A, 480
Multi-pole single-tank circuit breaker, A, 634
Non-metallic electric-heating element, A, 761
Oil-engine development, An, 518
Oil fuse for rural use, An, 814
Oil hoist, An electric, 235
Plane, An electric hand, 115
Ploughing tractor, An electric, 275
Poles, Spiral rolled-steel transmission, 981
Rectifier, A new, 849
Refrigerator, An electric, 397
Rivet heaters, Electric, 275
Safety lamp, A new electric, 38
Screw for hammer drive, A, 275
Shade gallery, A new, 275
Singeing machine, An electric, 815
Solder compound, A, 981
Speed-indicating relay, A, 37
Street-lighting unit, A, 115
Stuffing box, An automatic, 115
Sub-station, A self-contained outdoor, 849
Switch development, A, 598
Timepiece, Electric supply, 38
Tool-bar, A "feeding," 518
Tramway ticket punch, A new, 518
Tumbler switches, New, 517, 761
Ultra-violet lamp, An improved, 814
Urns, A new design of electric, 38
Vacuum cleaner, Another, 814
Water heater, A novel electric, 440
Watertight plug and switch, A new, 397
Wheatstone bridge, A direct-reading portable, 598

The New Year.

THE majority of our readers will receive the present number of the ELECTRICAL REVIEW on the first morning of the New Year, and we avail ourselves of this timely and appropriate moment for greeting all of our supporters, and all whom we endeavour to serve, with a very cordial and confident wish that they may have happiness and prosperity from January to December in 1926.

We do not say this purely because it is the custom for good wishes to be on everybody's lips on New Year morning—in the past there have been times when the prevailing and threatening conditions have heavily beclouded the situation and prospect so that any such wish seemed to be little more than father to the thought. To-day, we believe, notwithstanding the difficulties that are known to lie ahead of us in settling some of our serious industrial problems, that there are signs that justify greater optimism than could safely be entertained at any other time during the last few years.

The official analysis of unemployment returns reveals encouraging information regarding the industrial "spots" where changes for the better have lately been taking place, and it cannot fail to be of assistance in dealing with this serious problem to know just where and why things have been getting worse. It narrows down the questions for discussion and clears the pathway to betterment. It is of practical value to other branches of industry to know that the Ministry of Labour finds that, apart from the crisis in the coal industry, the figures appear to indicate that the general improvement in employment experienced in 1924 continued during 1925. In the engineering industries—which have been up against exceptional difficulties for a long while—there has been a distinct improvement in employment. As an indication of the general trend of things, it is noteworthy that, while the year's increase in unemployment in mining was 116,878 workers, the total number of insured

persons unemployed increased by only 55,178. The improvement of the last month or two affords further encouragement, but from the standpoint of national engineering industry, the fly in the ointment consists in the reduction of men engaged in engineering industry by their transfer to other trades or their departure to lands where their class of work has presented better opportunities than they could find in this, the Birthplace of Engineering.

If we turn from the general to the particular, and limit our thought to the outlook for the electrical engineering industry and trade, we have every reason to be optimistic, for there appears to be abundant work in prospect in every section—plant, switchgear, &c., for power stations and industrial works, cables for electricity supply, telegraph and telephone development, overhead and underground lines, radio apparatus, appliances and fittings for domestic electric service, and indeed in the whole range of things comprised in the term "Everything Electrical."

If we pull "all together" enthusiastically, and are unafraid and full of initiative in enterprisingly launching out upon the development of departments of electrical activity in which there is unmistakable scope—such, for example, as domestic electricity and railway electrification—we shall be able to give employment to thousands more employés, and strengthen still further the position of British electrical industry. We might write much on the need for the spirit of Locarno to permeate our ranks—employers, staff, and workpeople—but the mere mention of that spirit will suffice at the moment. Another point which also presses in upon one's thought as one looks forward is the need that exists for us to continue to hang together in the support of British electrical industry, for there are many who fear that as the Continental situation improves under the influence of the great achievement at Locarno, the menace of foreign electrical competition will become much more serious.

Combustion Engineers in Power Stations.

THE correspondence on this subject which has appeared in our pages, together with the article by Mr. C. F. Wade which we published last week, should do good service in directing attention to the importance of this branch of central-station practice. It may no doubt be a platitude, but it is true, that the greatest scope for economy in the generation of electricity is to be found in the operation of the boiler house. The boilers, turbines, condensers, and other plant are the tools with which the station engineer manufactures electricity—once installed, they cannot be materially altered in design; but they may be used efficiently or inefficiently, and the financial results of the working of the plant depend mainly upon the ability of the engineers who are directly responsible for their operation. Certain economies can be effected in the engine room, but it is in the boiler house that skill and knowledge have the greatest opportunity. In emphasising this fact, we have no thought of "belittling" the status of the engineer in charge of the engine room, who bears a heavy responsibility.

We are pleased to note that the views of the Electrical Power Engineers' Association, as embodied in the editorial columns of the current issue of its journal, *The Electrical Power Engineer*, are in harmony with our own. Referring to the recent correspondence, our contemporary agrees "that there still appears to be a deplorable lack of appreciation of the importance of the work that a technically-trained combustion engineer may carry out in the boiler house," and proceeds to take the Southampton Corporation to task for offering a salary of less than £300 a year for a fully-qualified man, pointing out that to satisfy the specified requirements an applicant must not only have had a good technical training, but also must have held a responsible position in a large power station where it was the practice to make tests both of fuel and of boilers. "Usually a man fitted for the vacancy must have held at least a charge engineer's position." The journal points out that such poor salaries will deter engineers from qualifying themselves for these important positions, and that "it is not likely that a man will spend time, energy, and money equipping himself with special qualifications if the inducement to do so is so unsatisfactory." The *Electrical Power Engineer* therefore regards the competent combustion engineer as an adequately trained and experienced charge engineer who has added to his attainments further special qualifications, and rightly claims that in order to secure the economies that such a man can bring about in the boiler house, electricity supply authorities must be prepared to offer him a fair rate of remuneration.

A Washer not "All-Electric."

IN our "Correspondence" columns to-day we are reproached for publishing a description of a new electric washer because it is provided with a gas burner for heating the water. Surely the ease with which an electric immersion heater can be substituted for the gas burner is so obvious that the objection is trivial. The design of the washer *qua* washer presented so much novelty that we would not let the one patent defect of the device condemn the whole to obscurity. Moreover, if the small motor—the most expensive single item in the construction, and the only part which interests the electrical manufacturing industry—does not justify the description of this washer in an electrical journal, then *no* electric washer is entitled to appear in our pages; for the other machines, as our correspondent implies, have no provision for heating at all, and have only the motor to justify their inclusion.

With regard to that question of heating, we have heard strong objection raised to the ordinary electric washer by a practical housewife on the ground that she would have to retain the "copper" to heat water for the washer. The suggestion implied in the last paragraph of our correspondent's letter (that washing machines do not require heating arrangements) savours of the "what-was-good-enough-for-father-is-good-enough-for-me" idea; and in the many large areas where electricity for heating water is still charged for at over 2d. per kWh, there is quite a good reason why the heating medium should not be electricity. The part-electric house came along before the "all-electric" home, and every step towards lightening domestic labour, improving the day load, and giving employment to electrical workpeople is, in our opinion, a step towards a higher plane of comfort and prosperity.

French Industrial Progress.

THE report of Mr. J. R. Cahill, British Commercial Counsellor at Paris, which we review in this issue, records a continuance of the prosperity which the French electrical industry has enjoyed since the war. All over the world the extension of the use of electricity is proceeding, but it is probably true that France is in the van of progress in seeking to make up her severe war losses by its aid.

Summing up the present position of France, Mr. Cahill says that she has considerably reinforced her permanent capacity as a producer of raw materials; she is acquiring a wider and more penetrating hold upon her home market; and by virtue of her improved equipment, her larger-scale production, the combination and consolidation of her great industries, and her enhanced comprehension of foreign trade methods, she possesses now greater industrial capacity, skill and competitive power as regards foreign trade.

Electric Panel Heating.

A Brief Description of the Most Recent Installation.

By R. M. BUSSY.

DUE perhaps to the fact that "electric panel heating" has, until recently, been confined to private houses and establishments, few people seem to be familiar with it. It has, therefore, been a surprise to many to hear of the remarkable results that have been obtained from the most recent installation, which is the first of its kind in a public theatre, namely, the Cinema de Paris, in Leicester Square, London. It is proposed to give here a few details, to acquaint readers with the principles of this system, with special reference to the installation mentioned.

Fig. 1.—Cinema de Paris Auditorium, showing Ceiling Panel Heaters.

So far as has been possible standard size, or "unit," panels have been utilised throughout the theatre, being 6 ft. by 3 ft. by 1⅛ in., fixed on the surface of the ceiling and finished with suitable moulding so that they follow the general lines of decoration. Although this method was adopted in this case to save time in erection (the theatre was not closed during the whole of the work), it is more usual to bury or form the panels in the ceiling, thus giving a smooth ceiling surface. There are thirty-four standard panels on the auditorium ceiling, fig. 1, and two in the corridor from the Charing Cross Road entrance. Further, three panels are fixed in the Charing Cross Road (two) and Bear Street (one) entrance lobbies, which have been specially shaped and have their sides parallel with the adjoining walls. Every panel is fixed with six ¼-in. bolts, two passing right through the roof and four being ragged into it.

The conduit used is of the heavy gauge screwed class, and is embedded under the cornice on each side of the auditorium. Square boxes, 4 in. by 4 in. by 2 in. deep, are fixed in the centres of each bay, and tubing from the panels is bent down behind the cornices and into the boxes. In this way all the wiring is confined to the two chases, while the square boxes (with their lids flush with the wall) allow ample openings for handling, should it be necessary in the future. The panels are wired in pairs, each pair having a separate switch and pair of fuses.

The switchroom is situated by the side of the projection room at the end of the theatre, fig. 2. The gear consists of a main 150-ampere ironclad switch and fuses surmounted by a connector box, on each side of which is a ten-way ironclad fuse board. The central connector box provides ironclad protection for the extended bus-bars, the connections from the main switch, and also the shunt for an ammeter, reference to which will be made later. Under each fuseboard is a cast-iron box having a teak front panel on which are mounted ten rotary switches.

The ammeter is of the long-scale type divided in such a way as to show a definite movement as each circuit is energised. This enables the operator to see at a glance whether each circuit is in perfect order when he manipulates its switch. The whole of the switchgear is mounted on a metal frame and efficiently earthed.

The method of switching that has been adopted gives a control of 17 variations, not only of radiant heat emitted, but also of location of the panels emitting. The heat control enables the auditorium temperature of 55 deg. F. to be maintained constantly, while the control of the panels from the point of view of location enables variations of wall absorption, due to variations of wind, &c., to be counteracted.

It is due to this perfect control that the consumption of electrical energy is so low. In the extreme case of a prolonged outside temperature of 30 deg. F., only 23 kWh per hour are required to maintain a temperature of 55 deg. F. in the whole of the theatre when it is empty; when the outside temperature is about 42 deg. F., not more than 15 kWh an hour are required. These

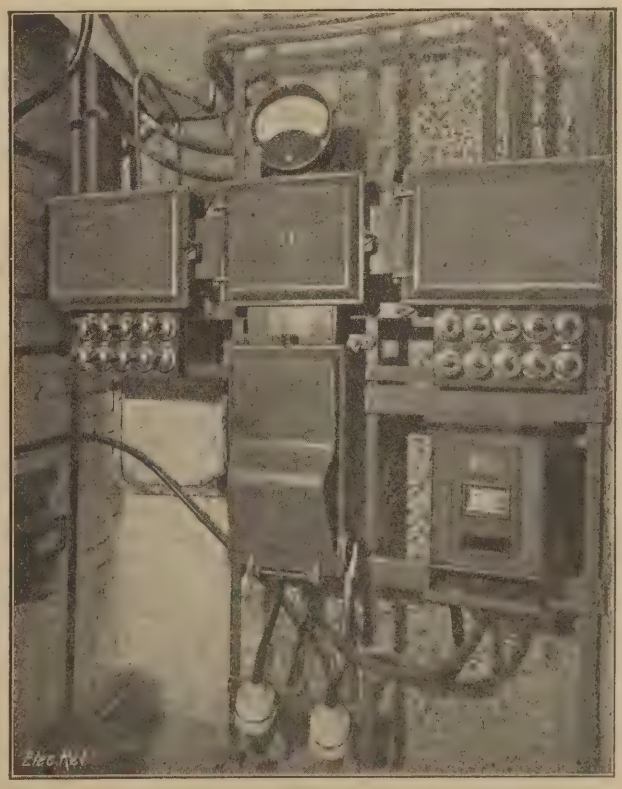

Fig. 2.—Switch Room for Panel Heating.

figures are based on the assumption that there is no audience present and, therefore, are higher than is generally found necessary in practice.

At the Cinema de Paris, the unanimous opinion of the management is that the heating bill for entertaining over four hundred patrons at each performance is lower than it would be with any other system. Further, it must be remembered that only radiant heat is used, the panel temperature being too low for convection currents, even were this possible with the panels fixed to the ceiling. It is the freshness and coolness of the atmosphere which first strikes the visitor so pleasantly upon entering the building.

With regard to maintenance cost, it must be remembered that not only is the price of electricity for heating very low, but in many cases special prices are quoted by the electricity supply authorities for such loads as these. Moreover, the control requires no special operator. A simple chart has been hung on the switch-room wall, and on it the panels are indicated and numbered, the numbers referring to the switches by which they are operated. Obviously, all that has to be done is to look at the chart for the reference numbers of the panels that are to be put into use and then to turn the corresponding rotary switches. No special knowledge at all is required.

It should be added that only after a long trial of gas-steam radiators, was the decision made to change over to an electrical installation. The panel system was chosen rather than that of electric radiators, on account of the increased seating space which became available when the source of heat was removed entirely from the floor.

Since the completion of this installation, which was carried out entirely by Messrs. Grierson, Ltd., the patentees, to the instructions of the architect, Mr. Robert Atkinson, F.R.I.B.A., the popularity of the system has increased enormously, and several of the contracts now in hand are the direct outcome of the excellent results obtained at the Cinema de Paris.

An All-Electric Experiment.

Some Particulars of Cottages Recently Erected near Birmingham.

AN experiment of considerable interest is being carried out at Birmingham, where the Woodlands Housing Society, Ltd., has recently erected two cottages equipped with apparatus for lighting, heating and cooking by means of electricity. The cottages, fig. 1, have been built to a compact design by the Society's architect, Mr. S. A. Wilmott, special thought being given to the questions of comfort and convenience to the householders. Each dwelling comprises a large front sitting room, 16 ft. 5 in. by 11 ft., a combined kitchen and scullery, three bedrooms, and a bathroom. One cottage is "all-electric," while the other one has one coal range to warm the kitchen and heat the hot-water system.

Fig. 1.—All-Electric Houses.

The sitting room, fig. 2, of the "all-electric" cottage is lighted by means of a 100-W gasfilled lamp in an Italian alabaster bowl fitting, a plug being provided for a reading lamp. The room is heated by a 3-heat 3-kW radiator, a three-way adapter plug being installed to accommodate any other apparatus such as a vacuum-cleaner, kettle, toaster, &c.

The lighting equipment in the kitchen - scullery, fig. 3, consists of an enclosed-globe ceiling - type kitchen fitting with a 60-W gas-filled lamp. A modern electric cooker is supplied on hire by the City of Birmingham Electric Supply Department. A supply of hot water can be instantly obtained from a 3-kW Santon geyser, and a 3-kW wash boiler is also installed. A 3-heat 3-kW Utility fire,

Fig. 2.—Sitting Room.

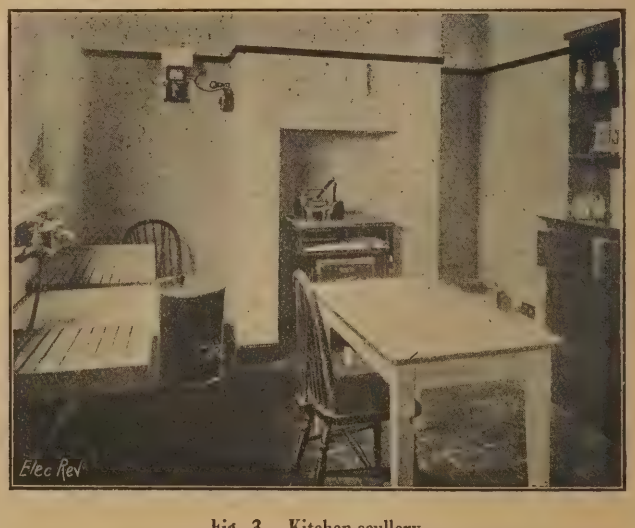

Fig. 3.—Kitchen-scullery.

equipped with a hot plate, supplies the necessary heating to this apartment.

Two lighting fittings, with 60-W lamps, serve the large bedroom, which is heated by a 2-kW electric fire. The other bedrooms each have one lighting point, and a wall plug is provided for a radiator. Two fittings provide for the lighting of the hall and the landing. A hot-water storage tank is installed in the bathroom and in the circuit for this and that of the wash boiler, pilot lamps are provided.

Ample allowance for extensions has been made in the wiring, which is run in screwed tubing.

In order that builders, architects, and all interested in the housing problem might have an opportunity of seeing the cottages, they were open for public inspection during the week commencing December 14th, when members of the staff of the City Electricity Department, which is naturally supporting the Housing Society in its experiment, were daily in attendance to give information. During the week additional apparatus, consisting of an electric sewing machine, vacuum-cleaners, toasters, irons, and other labour-saving appliances, were installed, and a cookery demonstration was given each afternoon by the department's lady demonstrator.

Great credit is due to the Woodlands Housing Society for its progressive move, which, we believe, is the first of its kind to be undertaken by such a society, and which should prove an encouragement to similar concerns and to private builders; the result of the trial will be awaited with interest by many who are interested in the housing problem.

The purchase price of the "all-electric" house, complete with the apparatus, on leasehold for 99 years, is £500, and Mr. Dean, the secretary of the Society, who has all along enthusiastically supported the experiment, states that this house has already been sold. The gardens of both cottages have been tastefully laid out by the Bournville Village Trust.

Large v. Small Generating Stations.

A Comparison of Coal Consumptions.

(COMMUNICATED.)

ACCORDING to statistics prepared by the Electricity Commissioners nearly sevenpence out of every shilling spent on the generation of electricity in Great Britain is required to pay the coal bill. That the cost of fuel usually outweighs all the other expenses of running a power plant put together is generally recognised among central station engineers, and a healthy rivalry exists in the reduction of this preponderating item of the generating costs. While, however, the cost of fuel per unit generated is a satisfactory measure of efficiency for the accountant, it is not so fair from the technical point of view. The figure varies exactly in proportion to the price per ton at which coal can be purchased, so that the engineer whose plant is unfavourably situated with regard to coal supplies is under a heavy handicap when costs alone are considered. The real technical criterion of performance is, of course, the thermal efficiency of the station, but so great is the difficulty of determining the true average calorific value of the fuel burnt—to say nothing of the impossibility of getting other engineers to believe that it has been accurately determined—that the Commissioners, wisely, we think, have disregarded thermal efficiencies in their recent "Return of Engineering and Financial Statistics." They give, instead, merely the pounds of coal per kWh generated, leaving the reader, from his knowledge of power station matters in general, to make what assumptions he likes as to the calorific value, and therefore as to the thermal efficiency in any case. Should a station be burning "duff" or other low-grade coal the pounds of fuel burned per kWh may appear high, but reference to the tables of costs will indicate whether the performance is justified by its financial results.

Unfortunately, no method of comparison can be fair to all stations. Costs, as we have seen, have no necessary correlation with technical efficiencies. The latter, again cannot be fairly appraised by merely regarding the quantity of fuel burnt per unit generated, as this figure will depend not only on the quality of the fuel, but on the size and nature of the station concerned. With all its defects, however, the simple method of comparing fuel consumptions per unit, without reference to anything else, gives us the best "first approximation" to what we want. Allowances can be made afterwards for disturbing factors. The two things which are known with as much certainty as anything in a power station are the weight of coal burnt in a year and the quantity of electricity produced in the same time. Hence the data for the calculation are fairly reliable. Besides, after all, a pound of coal is a pound of coal, and if one station burns four pounds per kWh while another only requires two pounds, the fact is interesting, and the explanation, if there is a satisfactory one, can generally be found.

Keeping then to this basis of comparison, it is instructive to note how the fuel consumption of different stations varies with their magnitude. The question often arises as to why a comparatively small station, so long as it is large enough to justify the expense of modern equipment, should not be practically as efficient as a station of the largest size. Put in another way, the question becomes: "What is the limit of size, below which a high efficiency is not obtainable?" The matter is not one that can be satisfactorily settled by calculation. A small station may not be able to afford combustion engineers, chemists, and other specialists to supervise operation, but on the other hand every detail can receive the personal attention of the chief, who, if he is a good man, will achieve results that many a more elaborately organised undertaking fails to attain. The best engineers are by no means always to be found in the biggest stations. The salaries which attract good men attract bad ones as well, and neither electricity committees nor boards of directors are infallible in their judgment.

Instead of trying to determine from theoretical considerations how small stations should compare with large ones in the matter of coal consumption, it is much more satisfactory to see how they do actually compare in practice. It is misleading to bring individual plants into contrast because of variations in managerial ability and other features. The only fair comparison is on a statistical basis, taking a large number of stations into consideration so that individual peculiarities may average out. The data collected by the Electricity Commissioners enable this comparison to be made. Particulars are given in their return of the fuel consumption per kilowatt-hour of nearly every power station in Great Britain, whether owned by a company or a municipality. To present the facts in a graphic form, the coal consumption per kilowatt-hour has been plotted in fig. 1 against the annual output for 123 stations having outputs of less than 20 million kilowatt-hours per annum. These are all municipal plants, the company plants being omitted merely in order to keep down the number of points. Disregarding stations using oil fuel partially or wholly, and also those for which the required data were missing, there are tabulated in the Return 153 municipal plants

in England alone. Twenty-nine of these are excluded, as having outputs of over 20 million kilowatt-hours per annum, and one, with an output of about 100,000 kWh, has been omitted because its coal consumption point of 12.8 lb. per kWh fell outside the limit of the chart. The performances of the remaining 123 stations are represented by the points plotted.

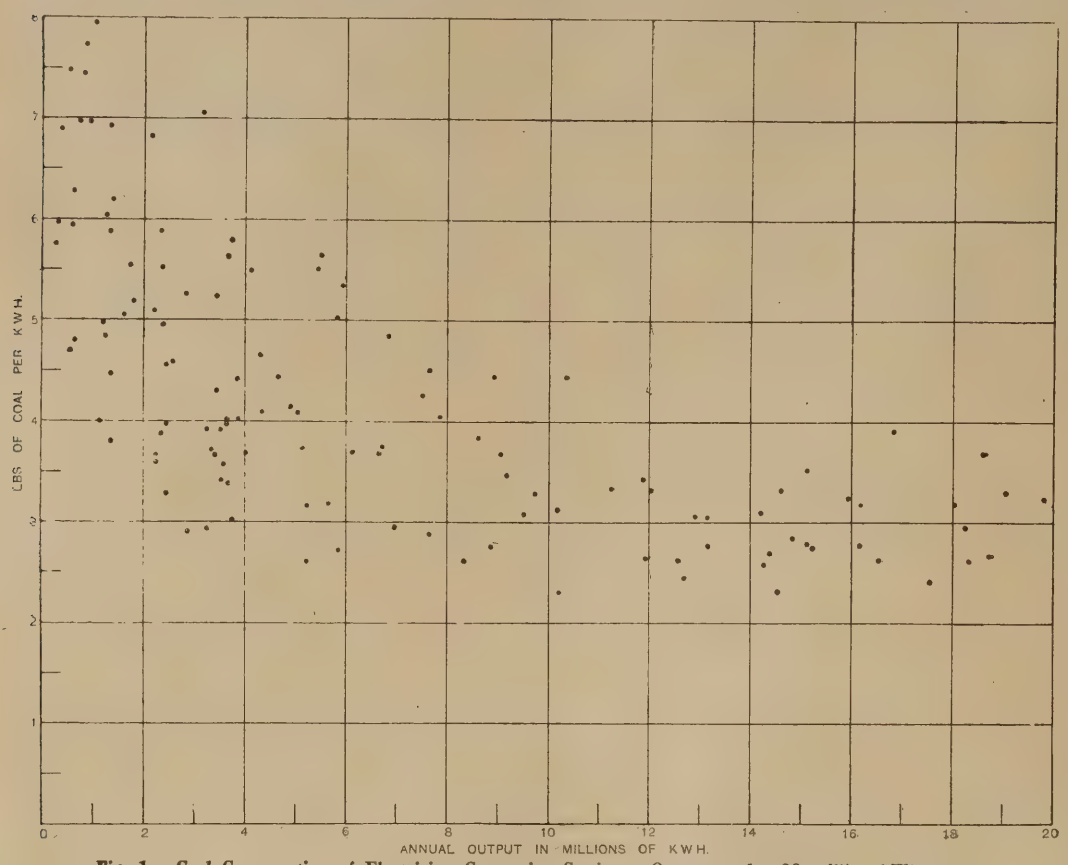

Fig. 1.—Coal Consumption of Electricity Generating Stations; Output, under 20 million kWh per year.

Two things strike one especially when looking at the diagram: first, the relatively large coal consumption of the smaller stations, and, secondly, the extraordinary differences between individual performances. Of the 12 stations having an output of less than a million kilowatt-hours per annum, one required 7.73 lb. of coal and another only 4.69 lb. per kWh. Of the next 13 stations, with outputs between one and two million kilowatt-hours, the fuel consumption ranged from 7.96 lb. to 3.80 lb. per kWh, and so on. In the 5 to 6 million group one station, with an output of 5.517 millions, consumed as much as 5.65 lb. of fuel per kWh, while another produced 5.220 millions for a consumption of only 2.61 lb. The former station we will not mention by name, as the engineer, no doubt, has sufficient trouble already, but the latter, which is that at Nelson, in Lancashire, deserves credit for its performance. The fuel consumption is only beaten by five other stations, all much larger, and only one of the seven plants with outputs over 18 million kilowatt-hours can equal it.

Only four of the 123 stations dealt with could show a fuel consumption of less than 2.5 lb. per kWh, and the best of these, Rawtenstall, also in Lancashire, with a consumption of 2.30 lb. per kWh for an output of 10.199 millions, beat every other station up to the limit of 20 million kWh, at which the diagram ends. It will be also noticed that there is practically no difference between the average performances of stations with outputs ranging from 10 to 20 million kilowatt-hours per annum. From the evidence of the chart, it would appear that a 10-million station would be every bit as economical as a 20-million one. The range might even be extended, for it is very clear that even a 5-million station under good conditions can, in practice, do as well as the average station three or four times as large.

Leaving exceptional cases, however, out of consideration, one could fairly conclude that stations of an output of less than about 10 million kilowatt-hours are unduly heavy on coal consumption, and unless they are likely to grow rapidly to larger dimensions, the justification for their continued existence should be examined. This does not imply that there is any *à priori* case for scrapping them. Circumstances may well be such that the cost of electricity transmitted from a large and economical station a long way off would be greater than that of electricity generated in a small and uneconomical station locally. Every case must be considered on its merits, but if the smaller stations are to survive anywhere but in the remotest country districts, those responsible for their management should see that their performances are brought to within measurable distance of what has been shown to be possible.

We may now turn to the records of the larger undertakings. As these are not only of greater interest on account of their magnitude, but are also fewer in number, all stations having an output of over 20 million kilowatt-hours in Great Britain, whether municipal or company owned, will be considered together. The largest undertakers in the country have, as a rule, more than one generating station, and it is generally difficult to determine from the Commissioners' Return the performance of the individual plant. Neglecting for the moment cases of this kind, we have particulars of 28 stations with outputs ranging from 20 to 100 million kilowatt-hours. The performances of these stations are plotted in fig. 2. The great majority, as will be noted, have coal consumptions ranging between 2.5 lb. and 3.0 lb. per kWh. Again we find no sign that a large station is more economical than a smaller one. The record, among the undertakings dealt with, is

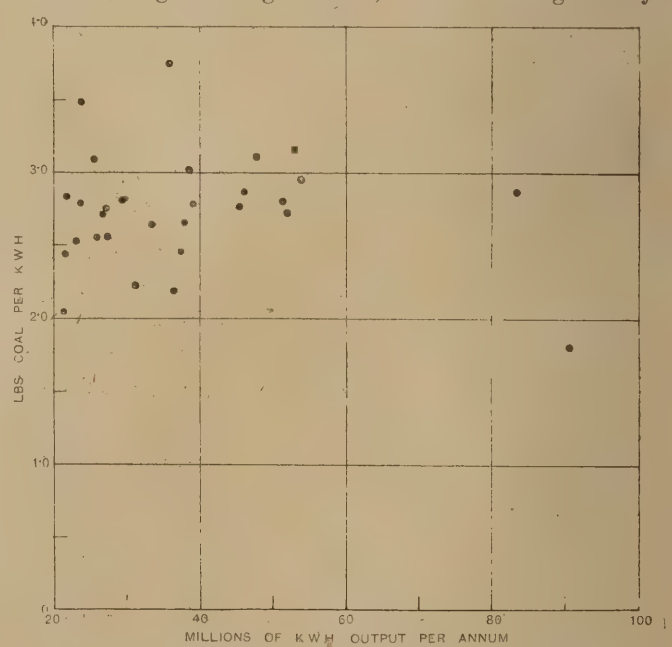

Fig. 2.—Coal Consumption of Generating Plant; Output from 20 to 100 kWh per year.

certainly held by the wonderfully efficient station of the Lancashire Power Co. at Radcliffe, where Mr. Adams, with steam at only 160-lb. pressure and 520 deg. F. temperature, has reduced his coal consumption to 1.8 lb. per kWh on an output of 90.377 millions per annum. The next best performance of the group is that of Mr. L. L. Robinson at Hackney, with a consumption of 2.04 lb. on an output of 21.464 millions. The unfortunate city which, at the date of the return, required 3.74 lb. of coal per kilowatt-hour to generate an output of nearly 40 million kWh, has now got a new plant in service, and better results may be expected in the next return.

The performances of the undertakings which have been omitted from the diagram, fig. 2, for the reason given above, are tabulated below (see Table I) in the order of economy of coal consumption. Since no particulars are given as to the quality of the coal, the order of thermal efficiency is not necessarily the same as that given in the table, so readers must make what allowances they think fair in comparing the results. It must also be recollected that the Newcastle company's output, for example, is spread over four power stations, varying in size from 17,600 to 78,850 kW capacity of installed plant. Hence the coal consumption of 1.86 lb. per kWh, which is the average over all the four stations, is necessarily inferior to that of the best station of the group, which in the aggregate generates an output of 415.2 million kWh per annum.

In studying the performances which have been brought under review, it must be remembered that the figures are all concerned with periods prior to March, 1923. When the next Return of the Commissioners appears, it is very certain that the relative positions of many of the stations will be changed, and also that an appreciable general improvement in coal consumption will be manifest. Nevertheless, there is no reason to expect that the main conclusion will be different. This seems to be that for all stations with an output of more than ten million kilowatt-hours per annum, the performances will be approximately equal given equal efficiency of management. Below the capacity mentioned, the engineer is handicapped by the general inferiority of his equipment, but the results obtained by some of the small stations where the management is exceptionally good should serve to stimulate other undertakings to greater efficiency.

The Italian Electrical Industry.

(From Our Special Correspondent in Milan.)

UPON the principle that disappointment is the nurse of wisdom, Italy should soon derive some practical advantage from her somewhat costly experiences in pursuing a vast—and not very well considered—scheme of hydro-electric enterprise. Many millions of capital have been invested and, perhaps, many thrown away owing to the disinclination of Italian engineers—who, as a body, deem themselves inferior to none—to accept suggestion, let alone the offer of practical assistance, outside their own circles. The result of this somewhat unwise policy has been the perpetration of a number of mistakes, some, indeed, of a serious nature—such as defective designs for reservoirs and dams; ill-chosen sites for power-houses; and the selection for exploitation of districts which have subsequently proved subject to drought.

At the time of writing, there are signs that history may possibly repeat itself. Heavy storms have lately passed over the northern districts of Italy; while these have served to replenish the supply dams, the violence of the rains is believed to have undermined more than one of the main structures (built too hurriedly, it is to be feared, and without sufficient consideration having been given to the matter of contours). The terrible Gleno barrage catastrophe which took place at about this time two years ago (December, 1923), when material damage was caused exceeding 100,000,000 lire, has not by any means been forgotten. There are some who declare that the initial errors connected with the building of the Dezzo reservoir, the collapse of which caused the two villages of Teveno and Gueggio to be washed away and many persons to lose their lives, have been repeated in certain other localities. It is to be hoped that eventually this may prove not to have been the case. But the worst feature of this occurrence was that the dam at Lake Gleno had been built and put into use without the permission of the Ministry of Public Works. It is still possible to ignore the Department, and to proceed with public works of this nature without official supervision.

Notwithstanding these facts, the electrical industry of Italy is showing signs of real progress. During the current year the number of central stations has been appreciably increased, and plans are being made for additional stations. An attractive market for electrical machinery, appliances, and fittings is to be found in this country. While the Italians themselves have invested something like 3,000 million lire in the establishment of hydro-electric plant, a not inconsiderable proportion of foreign capital has been employed in the same direction. It is estimated that during the next five years not less than 700,000,000 lire per annum will be expended on new power plant, transmission lines, sub-stations, and other necessary construction.

The Electrical Market.

The opportunities for the sale of electrical goods in Italy are encouraging, notwithstanding the expanding domestic industry, which is constantly developing its home market as well as reaching overseas. Both in quantity and value the total imports in 1925 probably showed a slight decline over the previous twelve months. The principal imports which have come from the United Kingdom and the United States have included several classes of generators and motors, transformers, and various kinds of electrical apparatus. During the first three months of last year generators and motors, weighing 4,121 quintals, and valued at 6,073,303 lire, were imported, as against 3,786 quintals and 3,974,754 lire in 1923, and 4,335 quintals and 5,381,955 lire in 1924. Transformers showed a slight decline in weight, to 1,438 quintals, valued at 1,311,564 lire for the January-March quarter of 1925, compared with 2,085 quintals and 1,993,095 lire in 1923, and 1,229 quintals, valued at 970,967 lire, in 1924. Batteries, magnetos, electric meters, telegraph and telephone apparatus, and

electrical apparatus of various kinds also showed slight reductions either in quantity or in value. While the total imports for the period mentioned actually increased in quantity from 10,340 quintals, in 1924, to 11,100 quintals during the first quarter of last year, the value declined from 25,988,095 to 25,245,770 lire. This is all the more remarkable in view of the fact that the lira has continued to depreciate, the quotation now being nearly 20 per cent. lower during 1925 than in 1924 for sterling and for United States dollars. Regarding exports, which have included all the classes of electrical goods above enumerated, there was an advance over the same period from 4,871 quintals (valued at 7,951,213 lire) in 1923, to 7,407 quintals (valued at 11,103,329 lire) in 1925.

The largest supplier of electrical equipment to Italy has been Germany; Hungary ranked second, the United States third, Great Britain fourth, and France fifth. On the other hand, exports of electric generators and motors from Italy, which showed a decline in quantity from 5,529 quintals for the first three months of 1924, to 4,931 quintals in the first quarter of 1925, were shipped principally to British India (which took 25 per cent. of the total); Brazil and Argentina (which absorbed about 36 per cent.); and Germany, Spain and France (taking between them 17 per cent. and in the order named). The purchases made by Great Britain were small, not exceeding 135 quintals; these figures, however, showed an advance upon the previous year's record, which was 77 quintals, and very much exceeded that of 1923 when the figure amounted to no more than 1 quintal. It is worthy of note that while in the first quarter of 1923 the United States ranked third in the list of countries from which electrical goods were imported by Italy, in 1924 it sank to eighth, and in 1925 it was seventh. During the first ten months of last year, it is estimated, less than three per cent. of Italy's imports of heavy electrical machinery originated in the United States.

Development and Home Production.

Up to recent years, Italy was very largely dependent upon electrical apparatus of foreign manufacture, and, to a certain extent, is still so. None the less, a striking advance has taken place in home production, especially with regard to domestic lighting. This has now been extended to the great majority of the towns and villages of the Kingdom, except to those located in the more inaccessible of the mountainous districts. The use of electricity varies enormously in different sections of the country. In Calabria, for instance, the consumption for lighting *per capita* is only 2.8 kWh, whereas in Piedmont it reaches 26.70 kWh. The average for the entire kingdom is 13.70 kWh. For the current year (1926) the consumption is forecast at not less than 8,000 million kWh, and for 1927 to 1928, some 10,000 million kWh. In 1933, when most of the new stations now under construction, and those for which plant has been made, are completed, the consumption is expected to reach 12,000 million kWh.

Like most European countries, Italy is finding the production and use of electrical appliances of greater and greater importance in connection with the carrying-on of daily life and the conduct of its many industries. The demand for electrical equipment for the home, the office, the shop, the factory, and places of amusement has become insistent, giving rise to the establishment of a number of new factories and retail stores which are being supported and encouraged (by the most favourable taxation) to compete with foreign imports. But the country is still unable to do without resort to a variety of these. Figures of last year's trading in electrical supplies are likely to show little difference in actual value, but in quantity and weight the total may vary considerably from those recorded for the two preceding years.

The annual importation of incandescent lamps now exceeds 11,000,000, a figure which is below that of 1924, and some 2,000,000 under that of 1923. The difference in quantity means that the Italian home manufacture has increased, and is now more fully supplying the ever-increasing local demand. The main source of imported lamps is the Netherlands. To-day, the Dutch have the privilege of furnishing the supplies that formerly came almost entirely from Germany, which held first position among exporting countries. During the first six months of 1925, the Netherlands furnished close upon 3,000,000 lamps, which may be compared with 2,447,109 for the January-June period of 1924, 1,805,022 for 1923, and 2,972,925 for 1922. Germany, which has been under obligation to furnish Italy with lamps under the Reparation Agreement, failed last year to send anything in the way of supplies; but between January and June, 1923, 1,160,000 lamps, mostly of low power and of a decidedly inferior quality, were provided. The ordinary commercial supply of lamps, other than reparations, from the same source, for the period January-June, 1924, was 1,858,351, while during the first six months of last year over 2,000,000 were imported. Austria is another large furnisher of electric lamps, while Hungary and Switzerland send smaller supplies. There is a smaller market for British or American incandescent lamps—notwithstanding their admittedly superior quality—owing to the heavier freight rates involved and the longer distance of transport.

The largest sales—in some districts almost exclusive—are found for metallic filament lamps, with round and pear-shaped bulbs and Edison screw and bayonet bases.

Installation Practice.

Special receptacles, most frequently of the bayonet type, for the attachment of electric toasters, heaters, vacuum-cleaners, and other household appliances, are now installed in most houses. The rotary switch is generally used, but the push-button type is likewise popular. Switches of the snap and tumbler type are practically unknown. On the other hand, American switches are favoured by some Italian electricians, and strenuous efforts are now being made to push their sale by enterprising United States travellers. The fuses most commonly employed are the open link and the German "Z" type. The Edison screw plug takes precedence over both the American cartridge and the British thumb-grip types. The wiring of dwellings is left almost entirely to the discretion of the electrician or the house-owner, little or no control being exercised by the municipal authorities, but the organisation known as the Associazione Elettrotecnica Italiana consents, upon application, to exercise technical supervision over the introduction of new installations. The practice of wiring houses in Italy varies but little from that adopted by other European countries, and the rules governing insulation are only slightly different. Large quantities of twisted cord (a large proportion is imported) are employed, but of a type rather more flexible than the British standard. The most common practice followed in house-wiring is to run the wire or flexible cord on small porcelain knobs, or through thin insulated conduits of the Bergmann type. In houses built during the last twenty years, where the construction of the walls is of brick or cement throughout, this has been found to be the only possible way of introducing electricity. In modern houses, however, a cheap kind of low-grade iron conduit is being used, embedded within the walls or passed through the ceilings.

Water Turbine Testing.—In view of the fact that the rotors of electric generators driven by hydraulic turbines have usually to be designed to withstand for short periods from 1.8 to 2.5 times their normal speed, the Oerlikon Co., of Switzerland, has recently made special provision in its testing department for checking the accuracy of the mechanical calculations and the strength of the materials used in the construction of the machines by over-speed tests. To this end a pit capable of accommodating the largest rotor in a vertical position has recently been constructed; it is about 32 ft. deep and is provided with a thick lining of bags filled with sand as a protection against damage should a rotor burst during test. The pit, which is of a size enabling rotors up to a diameter of 21 ft. and of a weight up to 120 tons to be tested, is surmounted by overhead driving gear comprising two d.c. motors developing together about 1,000 kW at pressures ranging between 250 and 1,500 volts.

Miners' Electric Safety Lamps.

By EDWIN LYON, B.Sc.(Tech.), A.M.I.E.E.

(*Abstract of Paper read before the* BATLEY AND DISTRICT MINING SOCIETY.)

Of the desirable characteristics which a miner's portable electric safety lamp should possess, perhaps the cost of upkeep has been given too much prominence of late. The cutting down of upkeep costs has, in some instances, been taken so far as to reduce the efficiency of the installation. For the sake of a fraction of a penny in the weekly cost per lamp, spares have been cut down to a minimum, at times being foreign parts of doubtful quality, and the installation starved until it is unable to operate efficiently, and an apparent gain becomes an actual loss.

Owing to the heavy service demanded from an accumulator in use underground, it must possess additional characteristics to those needed for ordinary service: Strength is an important feature; accessibility is very desirable, also visibility of the electrodes; repairs should be easily carried out, the attention demanded as little as possible, and not skilled. The lead-acid and the alkaline types differ widely in construction, characteristics, and performance. The most familiar and widely used type is the lead-acid; when used in a miner's lamp special designs are necessary; for example, the grids of the "Ceag" electrode are triangular in section with the apex towards the inner side, to secure the active material safely. Whilst flat electrodes give more active surface area for a given space, circular concentric electrodes are simpler in construction and inherently stronger. The cost of upkeep is greatly increased if the acid is not prevented from leaking or creeping, and the three general methods of approaching the "unspillable" ideal are the provision of tortuous passages for the gases, the "inkbottle" principle, and "jelling" the electrolyte.

In practice gassing chambers require constant attention to prevent them becoming filled with acid, when leakage occurs. The "inkbottle" principle (the provision of space above the electrodes to hold all the electrolyte when the accumulator is reversed, the gassing tube being above the level of the acid in every position) necessitates a larger container, and is effective when kept in good condition. "Jelling" the electrolyte is the nearest approach to the ideal; not only is there no leakage at the inlet or gassing vents, but creeping and leakage at the joints, or minute cracks, are avoided and surprising results have been obtained by the use of "Jellac" (the "Ceag" semi-solid electrolyte). The consumption of spare parts has, in some instances, been cut down to half, and, in addition, the lamp operates much more reliably.

Owing to the higher internal resistance when a "jelled" electrolyte is used, the capacity of the accumulator is slightly reduced, but this is more than balanced by the saving in spare parts and the cleaner and regular operation. Another effect is a more even length of life of the electrodes, the negative having a shorter life than when free acid is used. Both electrodes are generally changed at the end of 12-15 months' service, this period being a fair average. With free acid the positive and negative electrodes are changed at different times owing to the irregular life and the maintenance is not so simple as in the other case, for the free-acid accumulator must be closely watched and topped up to compensate for the escaped acid, but the attention required by the "jelled" accumulator is regular and pre-determined; this means that a simple routine can be followed and the work systematised and simplified.

Another type for which rather startling claims have been made is the alkaline accumulator, which is inherently much stronger than the lead cell, owing to the steel electrodes and container, which also enable it to stand short-circuits and rapid charge and discharge. For many duties these features are desirable, but for lighting a miner's lamp they are of little value, as short circuits very rarely occur, and the rate of discharge and charge does not vary. The voltage of each cell is 1.3, so that the usual standard unit is composed of two cells and the voltage of the battery is therefore 2.6 volts. The discharge curve is comparatively steep, particularly at the commencement, with the result that when used in a miner's lamp the bulb is working at a higher voltage at the beginning of the shift. This means that the bulb is over-run at the first stage, or is not operating efficiently over the greater portion of the discharge, see fig. 1. The watt-hour efficiency is much lower than that of the lead-acid accumulator; although this, in itself, is not an important factor as the cost of current is rarely considered, it has an effect on the initial cost of the charging equipment. Owing to the high internal resistance the final voltage of the battery when on charge is nearly 3.6 volts, so that on a 110-volt circuit only thirty alkaline cells can be charged in series, whereas the same equipment would be suitable for forty of the lead-acid type. The initial cost of the battery is also high, being approximately three times that of the other type.

The bulb is the next component of fundamental importance. The bow-shaped filament seems to be now universally adopted as the simplest and strongest design. The modern bulb is a reliable and efficient component; there is, however, one important factor that might well be considered, and that is the relation between the watts per candle and the length of life. The higher the watts per candle, the longer the life; in other words, the higher the illuminating efficiency the shorter the life, and the most serviceable bulb is a compromise between these factors. A bulb working at about 1.9 watts per c.p. has an average life of 500 burning hours, and this is the usual rating. Another interesting relation is that between the applied voltage and the candle power of a bulb. Fig. 2 shows that for an increase in voltage the increase in candle power is more than correspondingly great. It follows that the c.p.-time curve is an exaggerated copy of the discharge curve, showing the importance of an even discharge voltage.

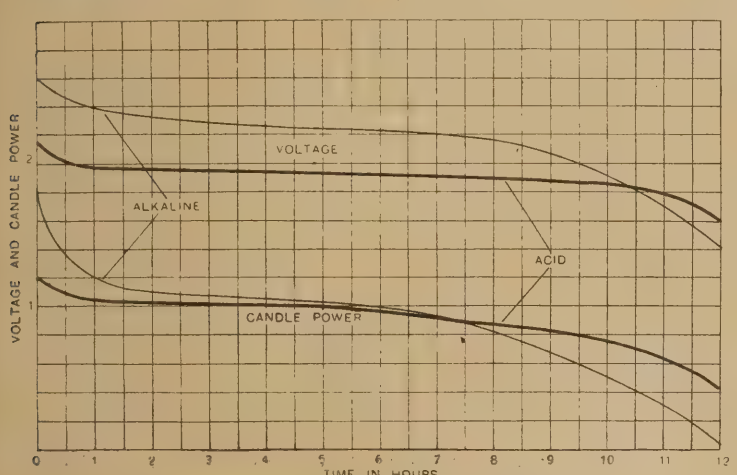

Fig. 1.—Discharge Curves of Miners' Electric Lamps; equal size, and bulbs of same efficieney.

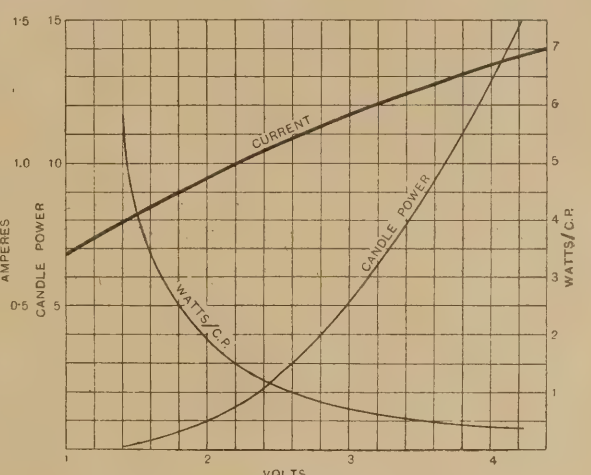

Fig. 2.—Characteristic Curves of 2-V Miners' Lamp Bulb.

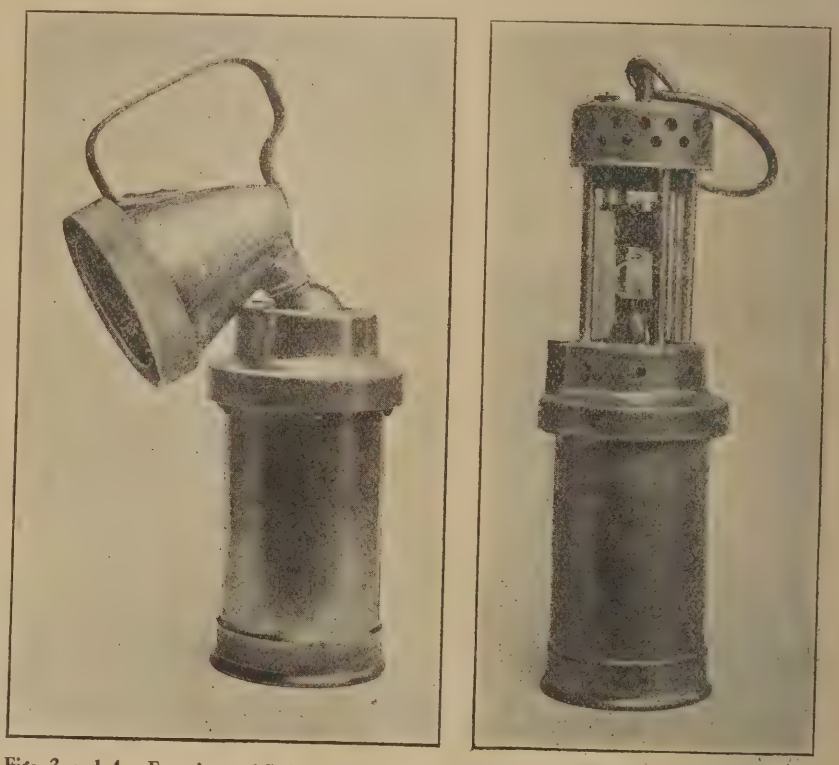
There are two alternative methods of securing the lamp parts together: the Oldham lamp is a typical example of machine-operated screw-thread joints, and the "Ceag" lamp an example of the application of the bayonet joint. An interesting speed joint is the "Ceag" ratchet retaining ring: To remove the wellglass and bulb the ring is given a quarter turn with a small hand key and the fittings are available without further dismantling. A recent development in the direction of quick operation of components is the Oldham "snap-on" lid, which enables the electrodes to be taken out and the cell case cleaned out in a very short space of time, as the lid is removed by a simple machine. The lid carries an annular ring with a groove in the periphery, and when pressed on to the case, expands it past the edge of the ring when it closes into the groove; a rubber ring in the groove makes a leak-proof seal.

The "Ceag" quick-action lid operates on a different principle: Three lugs on the lid are so designed that by pressing the lid on the case they drop into internal slots, definitely locating and retaining the lid in position. The accumulator is made unspillable by the provision of a groove in the lid which holds a special composition. As the case fits into the groove a light leak-proof joint is made, although, as "Jellac" is used, this is not essential. When the lid is given a twist, the lugs disengage and allow the removal of the electrodes whilst still on the lid. It is not necessary to remove the contact nuts, so that the time needed for dismantling is reduced to the minimum.

One of the chief advantages of an accumulator which can be rapidly dismantled is that there is more encouragement for the lampman to give it regular periodic attention. This is most important; if inspection and cleaning can be performed without much trouble there is more probability of it being done



at the correct time. Particularly in the case of "jelled" electrolyte, topping up should take place at least every fortnight, and attention given to this will lengthen the time before cleaning out is necessary and keep the accumulator in a healthier condition. Differences between the upkeep costs of installations using the same type of lamp are often attributable to lack of attention to these points.

In the two-piece lamp, the accumulator is made an integral part of the bottom case. This reduces the number of parts to be handled to two, but any advantages due to the increased speed in handling must be weighed against the disadvantages of not being able to see the condition of the accumulator, corrosion of the bottom casing, and the fact that spare accumulators alone can not be carried. One method of making an ordinary lamp into a "two-piece" lamp is to fasten the accumulator into the case with paraffin wax, which has been adopted in the Bruay mines in France, where it has apparently proved successful. As a semi-solid electrolyte is used, there is no trouble from leakage and less attention is required.

The electric lamp is inherently a safe lamp, but under certain conditions it is possible for the glowing filament of the bulb to ignite gas. To remove any possibility of damage the "Ceag" lamp is fitted with a safety fuse: The bulb has a taper socket and a central contact, making connection with a spring inside the reflector. An opposing spring fits over the pip of the bulb so that the bulb is carried between two springs, which protect it from bumps and jolts. If the outer glass should be broken the bulb rises and with it the bottom spring, which makes contact with the reflector, short-circuiting the accumulator and causing a tiny fuse in the reflector to isolate all the exposed parts, so avoiding any danger from ignition.

Objection was at first taken to the "pillarless" lamp on the ground of the apparent unprotectedness of the wellglass, but in practice it has been proved that this is an asset, as the lamp receives more care for this reason, and breakages are not increased, in some cases they have even been reduced.

To meet the demand for more light, a 4-volt lamp was introduced by the Ceag Co. Two of the ordinary circular accumulators are carried in an aluminium case and, by means of a simple arrangement in the lamp top, are automatically connected in series; it is made impossible to close the case if they are not placed in the correct way. The standard 2-volt fittings are used, including the safety fuse, and when used with the reflector down, a beam of 12 candle power is thrown forward, approximately four times the light given by the 2-volt lamp. Cap lamp reflection is much more effective than when the reflected light has to pass through thick wellglass, distortion due to refraction being considerable. If a white enamelled reflector, or one of frosted aluminium, is used, the distribution of the light is even and free from bright spots. In view of its many advantages it is surprising that its general use is confined to Scotland. Its restriction to this area is apparently due to prejudice.

Figs. 3 and 4.—Experimental Swivelling (left) and Gas-detecting (right) Miners' Electric Lamps.

To secure the increased efficiency of reflection given by the cap lamp, and be able to throw the beam in any desired direction—up or down and all round without any connecting wires—sounds like an ideal, but a lamp which fulfils these conditions has been designed. It has not yet made its appearance in public, and for the first time the details are now available: A head-piece, similar to that on the cap lamp, but larger, carries a lens and reflector. At the base of this is a ball joint which fits into a corresponding concave facing in the lamp top, fig. 3. This ball is split and the two parts are insulated, contact being made inside the lamp top. No live part is outside the lamp top, and as the spherical ball gives a universal movement, the light can be thrown in any direction; the collier can hang up his lamp and direct the beam on to his work. This is the nearest approach to the ideal in reflecting efficiency, and its tests underground will be watched with considerable interest. The design has been developed by the Ceag Co.

An electric lamp that will detect gas must be reliable, simple, and capable of being handled by the collier as easily as the lamp he is accustomed to use. A lamp, fig. 4, which approaches very closely to this ideal is now undergoing severe tests underground, and has so far justified the hopes of its sponsers. The principle on which it operates is simple: an ordinary electric safety lamp fitted with a special wellglass, carries above the bulb a small oil lamp; by the provision of double gauzes at the top and bottom the flame is made quite safe and the lamp is lit by a platinum filament. For general usage the ordinary electric bulb is used; when a test for gas is to be made, the light is switched off and, by rotating the lamp case, connection is made with an additional pair of contacts on the insulating plate. Current from the accumulator then flows up the supporting columns to the platinum filament, so igniting the wick of the small oil lamp. The current is then switched off, and the oil flame continues to burn, being regulated externally by a variable sleeve over the wick tube. The test for the presence of gas is carried out in exactly the same way as when using an ordinary oil lamp, and therefore requires no additional skill. Rigorous tests at collieries in different parts of the country will result in various minor modifications being shortly embodied. The manufacturers hope by this to go a long way towards solving a very old problem in a simple manner.

Reviews.

The Dynamo: Its Theory and Manufacture. Vol. III. Alternators. Sixth Edition. By C. C. HAWKINS, M.A.; M.I.E.E. Pp. xviii+572; figs. 710. London: Sir I. Pitman & Sons, Ltd. Price 30s. net.

The many earnest students of electrical machinery who have long awaited this—the concluding—volume of the latest edition of "The Dynamo," will not be disappointed, for the author is to be as heartily congratulated on this as on the earlier volumes. The new edition, however, has not been a matter of mere revision; in the present volume the subject of alternators has been treated in such a manner that we really have a new book before us. For example, the modern turbo-alternator, having reached the premier position among generators, is dealt with accordingly.

In the treatment of alternator armature windings, with which the book opens, no great degree of novelty is found or is to be expected. But when the e.m.f. induced in a loop on a toothed armature comes to be considered, an original method of explaining tooth ripples is introduced. For this purpose, a tooth cycle is divided into quarter stages, and the average e.m.f. induced per stage is deduced from the flux embraced by the loop in these positions. The results are interesting and it is to be hoped that designers will test this mode of attack by comparing curves thus predetermined with oscillograms.

A long chapter deals very fully with armature reaction in both salient-pole and non-salient pole alternators. The author is a firm believer in Blondel's two-reaction method of dealing with the effect of armature reaction in alternators for the purpose of design; he strongly maintains not only the accuracy of the method, but also its extreme simplicity. It is true that the formula for the direct (magnetising) armature ampere-turns is a little more difficult of establishment in the first instance, but this done it is only a question of inserting values. Starting on this basis, the writer has been at pains to calculate curves to be used for determining the regulation of alternators based upon the Blondel diagram instead of upon the simple triangle of magneto-motive forces. The latter method, so often used by others, including the reviewer, is strictly correct only for the ideal turbo rotor with uniformly slotted rotor and constant air-gap. As, however, modern practice has departed from the ideal by the adoption of non-slotted pole-centres, it will be seen that there is something to be said for the author's point of view.

The value that may be reached by the stator current on sudden short-circuit is discussed at some length, and in its pre-determination the author follows the simplified method in

which the resistances of the stator and rotor windings are neglected. The approximate result thus obtained is therefore a maximum which cannot be exceeded.

After further details of armature and magnet construction, the design of the salient-pole alternator and of the turbo-alternator are in turn considered. In the latter much space is devoted to a careful pre-determination of the full-load flux curve, the method employed being essentially the same as that set forth by the author in "Papers on the Design of Alternate-current Machinery," in conjunction with Mr. S. Neville, where it is used for the no-load condition. In the calculation, the fundamental of the flux curve is adopted as the origin of the specified e.m.f.—a process that will be found to make an appreciable difference in the actual maximum density.

An exhaustive study has been made to trace the air-flow in a turbo-alternator and to draw up a balance sheet of losses and rises of temperature

For the determination of the critical speed of the turbo-rotor, a new method of treatment is suggested. The author truly points out that when the rotor is still in the design stage nothing is known about the degree of mass eccentricity that may afterwards be found to exist in the finished rotor; consequently it is a waste of time to start from anything but a perfectly balanced shaft. For such an ideal shaft it is necessary to find some unique property, and it is argued that this may be found in a particular shape for the deflection curve, which the author determines by a process of trial and error.

The last chapter on the parallel working of alternators is a splendid example of the thoroughness of the author's work. Newer features in this connection are the treatment of two alternators when paralleled with unequal frequencies, and the action of damper windings in salient-pole machines in contradistinction to that in non-salient-pole machines.

Modern design is well illustrated with examples by such makers as the General Electric Co., Witton; Metropolitan-Vickers Electrical Co.; Société Alsacienne de Constructions Mecaniques; and the General Electric Co., of America.

Apart from the features to which special attention has been drawn above, the reader will find that the author has spared no pains in his endeavour to keep the book suitable for students and at the same time abreast of modern practice and theory. We know of no writer on electrical machinery whose work is more deserving of the title "classical" than the author of "The Dynamo."

Many of us pride ourselves on possessing the three volumes of Mr. Hawkins's work, but the permutations and combinations of the title on the cover backs do not appeal to an artistic taste. Though the publisher keeps the same position for his name, he does not use the same type.

Continuous Current Circuits and Machinery. By JOHN H. MORECROFT and FREDERICK W. HEHRE. Volume I. Pp. 467; figs. 377. London: Chapman & Hall, Ltd. Price 20s. net.

Professors Morecroft and Hehre, both of Columbia University, have collaborated to provide a volume on the direct-current side of electrical engineering that should prove of great value as a text-book in engineering classes. They very justly claim that the material here presented "seems to be about what the average engineering student wants whatever may be the branch of engineering in which he expects to specialise." It would also be an excellent book to put into the hands of any well-educated youth who is just starting upon an electrical apprenticeship, as it deals with the why and wherefore of the construction of electrical machines in an exceptionally clear and sensible manner.

In the early chapters dealing with electrostatics and simple current phenomena, the electron theory is used and the subject is viewed very largely from the electron standpoint. The chapters on electromagnetism, the electric circuit and self and mutual induction, also bear evidence of the hand of the experienced and painstaking teacher. The last-named section is especially well done, excellent use being made of oscillographic representations of inductive phenomena.

The treatment of practical subjects, such as meters and batteries, is equally happy and leaves little to be desired either in choice of subject matter or method of illustration. One curious little slip occurs in the description of the depolarisation of a battery: "this extra substance is generally an oxidising agent, to reduce (*sic*) the hydrogen set free at the positive pole of the battery: it is called a depolariser."

The best chapters in the book are those dealing with the dynamo electric machine. The first of these treats of the various parts, their functions, material and construction, and the reviewer has certainly never read a better account of the make-up of a dynamo. Not only are all the parts described and illustrated most carefully, but the general principles governing the design of electrical machines are explained by reference to actual calculations of their magnetic and electric circuits. The second chapter covers the subjects of commutation, field distortion, armature reaction, characteristic curves of shunt, series and compound-wound generators, and the parallel operation of generators. Then follows an equally comprehensive treatment of the direct-current motor and a chapter on efficiency, heating and rating—an excellent *vade-mecum* for the test-bed.

A chapter on Auxiliary Apparatus includes a general survey of switchgear, meters and regulators, and has also brief accounts of automobile starting and lighting equipment and electric welding—the latter appearing a little out of place in this particular chapter.

A very practical section on the location and cure of faults in electrical machinery completes the text book proper, and then follow a series of fourteen experiments in which the whole subject matter of the book would appear to be adequately reviewed by means of actual laboratory tests on generators, motors, meters, batteries and all the usual auxiliary apparatus found in a well-equipped electrical laboratory. The whole book has been thoroughly well done: it is in every respect a credit to its authors and is likely to find a wide field of usefulness on both sides of the Atlantic.

P. H. S. K.

Talks About Wireless. By Sir OLIVER LODGE. Pp. xiii+251. London: Cassell & Co., Ltd. Price 5s. net.

A new book by Sir Oliver Lodge is wont to receive a hearty welcome by a large circle of readers, and his "Talks about Wireless" will prove no exception. It is written for the people, simply, broadly, and large-heartedly. The Ether figures prominently, as one would expect, and Sir Oliver here clears away, once for all, the no-ether cobweb which has been spinning lately in the mind of the man in the street.

Part I, entitled "Radio in General," consists largely of a valuable, because authoritative, historical record of the early days of wireless. All non-essential details are omitted, the outstanding facts and the outstanding men alone are mentioned, and it is indeed pleasant to find full tribute paid to one great pioneer whose name is often omitted in this connection—Sir William Crookes. Sir Oliver's summary in a single paragraph on pages 46-47, in which are mentioned only three names, Maxwell, Hertz, and Marconi, might well be learnt by heart by all those who are accustomed to grapple with the distressing question: "Who Invented Wireless?"

Professor Elihu Thomson's claim that the Heaviside layer is unnecessary to explain transmission, is discussed generally, and though Sir Oliver says that he has "nothing dogmatic to say about it," it is clear that he certainly does not endorse that view.

Part II, entitled "Details that make for Efficiency," consists of an explanation of what should be done to minimise losses, and as an extreme case the author even visualises the possibility of immersing the receiving set in liquid hydrogen or helium, though, as he says, "such an arrangement could surely never be more than a curiosity." We notice that in considering the "Plain Aerial" from a theoretical point of view Sir Oliver concludes definitely that that system should be used for transmitting the S.O.S. signal, but in point of fact, as most of our readers are aware, it is not so used as practical considerations have been found to outweigh these theoretical advantages.

Part III, entitled "Calculations for Amateur Constructors," consists mainly of simple calculations of inductance and capacity, and is noteworthy for the fact that it is shown how simple these calculations become when the units of capacity and inductance are taken as lengths. For instance, what could be simpler than $L = 3\ n\ l$, the expression given for the inductance of a coil wound so as to give to that inductance a maximum value for a given length of wire?

Sir Oliver sends out this book as "a message of greeting to the great army of wireless amateurs and experimenters," and he may rest assured that his greeting is valued and welcomed by us all.

Electrical Engineers' Data Books. Edited by E. B. WEDMORE, M.I.E.E., F.Inst.P. Vol. III. Radio Engineering. (With Special Sections on Telegraphy and Telephony.) By J. H. REYNER, A.C.G.I., B.Sc. (Hons.). Pp. xxii+412; 314 illustrations. London: Ernest Benn, Ltd., Radio Press, Limited. Price 15s. net.

This is the third volume of the series of data books planned and edited by Mr. Wedmore, director of the British Electrical and Allied Industries Research Association.

In books of this description, where the aim is to give useful up-to-date data in a form convenient for practical application, it is all to the good if the author himself has had a wide practical experience of the subject in addition to sound theoretical knowledge.

Mr. Reyner possesses both qualifications in a marked degree, as, after a distinguished University career, he was employed for several years as a wireless engineer in the Post Office, and has recently joined the editorial staff of the Radio Press. He has thus acquired by practical experience a knowledge of just the sort of data required by professional radio engineers and amateur experimenters, and has produced a book of reference which will be found of great value to both these classes of practical workers in radio-telegraphy and telephony.

In this country, line telegraphy and telephony are a government monopoly, so that the section dealing with these subjects is confined to only 40 pages, and deals solely with matter which is of special interest to radio engineers, references being made to sources of more detailed information, should such be required.

The radio section proper, which takes up about half the book, is divided into sections, which deal, respectively, with calculations and measurements, tuning and radiation, thermionic valves, transmitters, receivers, masts and aerials, and miscellaneous data

D

The Appendices deal with mathematical, electrical, mechanical, and physical tables, electricity and magnetism, and wiring rules and regulations.

A certain amount of descriptive matter is included to make the data applicable to new developments, and frequent references are made to publications where fuller particulars can be obtained.

Wherever tested, the information given has been found accurate and up to date, except, indeed, that it has been noticed that no mention is made of the new method of applying inductive loading to submarine cables, an improvement which bids fair to change the whole scope of cable communication, and in the short-wave section, the statement that "perhaps the chief advantage of the system lies in the entire absence of any atmospheric disturbances on these wave-lengths" can hardly be justified by the results hitherto obtained.

There can be no doubt that Mr. Reyner has succeeded well in achieving what he says is the primary object of the book, *viz.*, to be "a handy volume of reference which will be indispensable to everyone concerned with the technique of radio."

Electric Lighting and Power Distribution. By W. PERREN MAYCOCK. Ninth Edition, revised and enlarged by C. H. YEAMAN. Volume 2. Pp. 600; figs. 365. London: Sir Isaac Pitman & Sons, Ltd. Price 10s. 6d. net.

Few men have exerted so powerful an influence upon the methods of teaching electrical engineering as the late Mr. Perren Maycock. His books made an immediate appeal to the practical type of mind and provided a welcome alternative to the heavy, academic treatment of the subject so commonly found in the text books of twenty years ago. It would have been a pity indeed to allow so valuable a series of books as those which came from the pen of Maycock to fall into desuetude for lack of the constant revision and enlargement necessitated by the rapid growth of the subject, and the completion of this new edition of what was possibly his most important and valuable work is a matter upon which both publishers and revisers are to be congratulated.

Although the old sky-blue covers have given place to a more serviceable and pleasant green, Mr. Yeaman has well maintained the mode of presentation of the original author and has certainly brought the book thoroughly up-to-date. This volume contains eleven chapters, of which the first two deal with direct-current dynamos and motors and appear to be something in the nature of an overflow from Volume I. The six main chapters, however, are concerned with alternating currents and constitute a very well-balanced account of the subject. A.c. principles, a.c. circuits, alternators, transformers, a.c. motors, and a.c. distribution, are dealt with in turn, and each section is well illustrated by many worked examples and clear line diagrams.

In addition, there are chapters on batteries, meters and systems of distribution of direct current. The book is rounded off by the inclusion of a list of a hundred books for further study and a remarkably complete index both to the letterpress and the illustrations.

Correspondence.

***Correspondents should forward their communications* at the earliest possible moment.** *No letter can be published unless we have the writer's name and address in our possession.*

Rural Electricity Supply.

I was very much interested in Mr. W. W. Clarke's letter of the 8th inst., on the subject of wayleaves, and perhaps the following notes on my own experience may prove of interest.

Owing to the fact that many of the large estates are split up into small holdings, even a short line usually means a dozen or more landowners. When the line runs into miles, the work of getting wayleaves becomes, as Mr. Clarke says, of great importance. That this is a difficult job cannot be gainsaid, for if the line is to be erected at a reasonable figure for wayleaves, the hapless individual whose work it is to get them signed is in the unhappy position of a person asking favours with nothing to offer in return.

I agree with Mr. Clarke's suggestion that the standardising of pole rentals would simplify matters somewhat, but even this would not eliminate the annoying delays and expense of inquiries. I would further suggest that a committee be formed to inquire into what is a reasonable figure per pole, which could be applied generally, and then that compulsory powers be vested with the supply authorities for all cases where a line is to be erected for the public benefit. Probably there are numerous ancient statutes which have prevented this course being taken already.

In the actual work of obtaining signatures to the wayleave agreement, many lines of argument occur to one, but it can be safely said that there is no certain way to success. After a first interview the line to be followed will vary according to the temperament of the person dealt with.

Personal experience has convinced me that nothing is to be gained by trying to persuade a farmer that you are doing him a good turn by sowing his land with poles, even if the annual crop is unaffected by adverse seasons. Another method I found of little use is to try to point out that the rental paid for so many square yards occupied by the poles is far greater than that which would be paid for an equivalent area leased to a tenant. Poles other than those in hedges are in the farmer's way, and a knowledge of the cost of farming operations is desirable in such cases.

In tackling a new line every effort should be made to create a good feeling between the authority and the landowner, avoiding if possible all hints of what will happen should the landowner refuse to sign. The difficulties of any other route but the one decided on should be quietly emphasised, and a little sympathy with the landowner and his unfortunate position in the line of route is not wasted. A few general remarks as to the benefit gained from a supply of electricity to the countryside, and tactful illusions to the fact that the landowner in allowing the line to go over his property is a benefactor to mankind, sometimes work wonders. The above generally constitute the method adopted in successfully negotiating the wayleaves for a number of lines with rentals as low as 1s. per pole.

At the best, however, the work takes a long time, with numerous interviews and the use of unlimited patience and tact and with very little thanks from the powers that be. It can only be relieved by further powers being given to the supply authorities.

Harry G. Steel, A.M.I.E.E.

Tynemouth, *December 20th*, 1925.

The scant reference which is made to "wayleaves" in both the technical and daily Press makes Mr. Clarke's letter in your issue of December 18th particularly interesting. Also his suggestion for a standard rental; but might I suggest that the proper term is "Standard" standard rental.

I agree with your contributor that there is a great temptation to which authorities sometimes succumb to increase the price in isolated areas where the landowner is more than usually hostile or when wayleaves are nearly completed. Often this increased price represents a large sum which is in the nature of a gratuity, but that is from thenceforward quoted as a standard by the potential granter of wayleaves, and in this way the average rental throughout the country is gradually forced higher. Morally, the practice of varying from the standard price is a sin against other authorities as well as against the guilty ones. Each authority has its own opinion as to the meaning of "standard."

Strictly speaking, I suggest that this national standard rental should be nil or that of a peppercorn given annually, and the only payments that can in any case be justifiable are those of compensation for the amount of land that goes out of cultivation due to the presence of the pole legs; an annual sum to cover the cost of hand labour on the diamond-shaped piece of land which machines must avoid; and a small sum to cover extra work to the farmer due to reinstatement after pole erection. I estimate these items to be respectively 3d. (assuming an area of .121 square yard with 10-in. diameter double poles and land worth 2s. 6d. per square yard); 9d. in the second case, and 3d. in the third case (assuming initial cost of 10s. spread over the life of the pole).

Therefore this electrically optimistic total is that of 1s. 3d. per double pole per annum for the worst position. Of course the farmer will say that he ought to be paid for the fact that he is more unfortunate than his neighbour, who has no poles inflicted upon him, and for the offence to his sense of beauty, but since fields are not particularly chosen and this sense of æsthetic beauty usually proves to have a value which can be numbered in shillings, I feel justified in saying that no payment should be permissible on sentimental grounds. Even power companies prey upon themselves in this matter. A case occurred some years ago in which an authority applied for wayleaves for sixteen poles—offering of course its standard price—to a landowner closely connected with another company. In reply an answer was received that "the wayleaves would be granted only at a price 25 per cent. in excess of the above, and provided the latter company's standard wayleave form—enclosed—was used." On this was a printed clause which stated that a sum of shillings *which was 50 per cent. of the standard price offered* was paid for all poles (A or H) with stays and wires attached!

It is the range in the scale on which wayleaves, in the various parts of the country, are paid which varies from 6d. to 15s. per double pole, that compels me to ask Mr. Clarke to define more fully the term "standard rental." Assuming that he is connected with a company whose lines are proving highly remunerative immediately, having a comparatively high load factor, and who pay a high rent per pole (my knowledge of wayleaves is that the higher the standard price paid the less easy it is to obtain wayleaves, since the principle of "biting the hand that feeds" applies here) he will have to take into account those authorities who, on rural work, for instance, pay a very much smaller figure, which is necessitated by the ratio between expenditure and pole rent, and income from the line. A country line in rural work is a far more speculative proposition than a line which is perhaps erected to give a bulk supply previously authorised by the Minister of Transport. Anything more than the fixing of the standard by Act of Parliament, such as the power to be given to authorities to force the poles at this standard price, is a serious and drastic step. But if this is not taken it will merely mean that one will be forced to negotiate wayleaves at a possibly lower price than one is authorised to give now, when the last state would be worse than the first. I agree that it would do away with that bugbear of precedents quoted, often invented, of the higher prices which so-and-so gave for their poles, and I would only make

the stipulation that once the standard is fixed it be a punishable offence for more to be offered in any circumstances.

Wayleaves and wayleave assistants are the "salt of the earth," and Mr. Clarke's plea for more publicity is both timely and necessary. After all, his sometime despondency and feeling of incompetence are things which I know his brother wayleave assistants share in common. Perhaps the Electricity Commissioners will again consider the matter for us. At a meeting in London last week the head of one of the largest supply authorities stated that "wayleave difficulties and stringent regulations had made them give up overhead work." Such a statement makes one think furiously as to methods which can be adopted to obviate these difficulties, and if the principle suggested by Mr. Clarke can be shorn of the many pitfalls that beset it I feel sure that he has done the electricity industry in general, and all of us, a good turn by inviting discussion on the matter.

J. A. Sumner.

Northwich, *December 21st*, 1925.

Honesty in Advertising.

It is the duty of every man or company with anything to sell to advertise it to the best possible advantage. But it is also their duty to be accurate and not emulate the methods of quack medicine proprietors.

One of your advertisers in this week's REVIEW claims to make one in four of the a.c. industrial motors sold in this country. With as much knowledge of the subject as they have I would guess that they don't make one in ten. It is a guess on both sides as there are no available statistics, but they could make a start by issuing a chartered accountant's certificate as to the number they make.

The same firm, however, in an earlier advertisement (September 18th, 1925) are on more certain ground, although not more inaccurate than the above. They state that motors not manufactured on their "thorough" system "may" take 15 per cent. more current, presumably for the same duty, and cite as an example a 100-h.p. motor. From a well-known firm's catalogue I find that a four-pole, 50-period motor of this capacity has an efficiency of 90.5 per cent. with a power factor of .92. For 100 h.p. this means an input of 89.5 kVA, or 103.5 amperes at 500 volts. As this motor is supposed to take 15 per cent. more current than the advertised motor, the current for the latter would be 90 amps., or 76.9 kVA, which gives an efficiency of 97 per cent. at unity power factor, or perhaps if the power factor is less than this the efficiency may be a "leading" one.

I hope other engineering concerns will not take this form of advertisement as an example to copy. Truth in advertising all the time!

Truth.

December 18th, 1925.

Choosing and Using an Electric Washing Machine.

I am stating the opinion of several of your readers when I express surprise that you have given up so much of your valuable space to boosting a gas-consuming apparatus because it happens to be compelled to use a tiny electric motor for the really *essential* part of its operation.

Will the next step be a description of gas cooking and heating installations because they have to use electric fans to take the fumes away? Perhaps the gas journals will reciprocate by giving laudatory notices of electric grills if the old fish-tail burner is left alongside.

We are getting rather an overdose of gas just now. We had more than a whiff at the B.E.A.M.A. dinner. The tap was turned on at the last Institution meeting, and now our very own ELECTRICAL REVIEW is making us swallow the beastly stuff.

To get back to our muttons—if washing machines should have heating arrangements attached to them (a point which seems to have escaped the 4,000,000 users referred to on page 967) why should not the heating medium be electricity? Some of us object to having a poisonous high-explosive in our houses.

E. E. Sharp.

London, *December 21st*, 1925.

[We refer to this matter in our leading columns to-day.—EDS. ELEC. REV.]

Super-Station Switchgear.

The article on this subject in the ELECTRICAL REVIEW of December 18th contains a number of very sweeping statements which, in the opinion of the writer, are not strictly correct, and for this reason should not go unchallenged.

A consideration of the oil circuit breakers built by the five main switchgear manufacturers in this country will show that the clearances in air, and oil, tank sizes, quantity and head of oil, rupturing speed, &c., are very similar for a given rating. The cubicles, trucks, and cellular structures manufactured by these concerns are so much alike in construction and arrangement of gear that it is difficult to tell one make from another without reference to the nameplate.

The actual lay-out of switchgear for large power stations in this country follows very stereotyped lines except in cases where it has to be arranged to fit into a certain space.

Under these circumstances it is difficult to condone the author's statement that there is no unanimity of opinion as to the design of oil circuit breakers, or the physical design and lay-out of switchgear, and it certainly does not support his suggestion that the design of switchgear is a matter of guesswork only.

The author states that the isolated-phase arrangement of switchgear is no more expensive than the usual cellular type from a space and building point of view, and suggests that a duplicate busbar, duplicate oil switch method of control, arranged on the isolated-phase system, is a panacea for all ills, remarking that no expense is too great to expend on control gear in continuity of supply can be assured.

It has been generally agreed that the isolated-phase arrangement of switchgear requires more space, and hence is more expensive, than the usual cellular type; more especially where duplicate circuit breakers are employed. This appears to be the reverse of the author's experience; however, he will agree that from a space and building point of view at any rate, there is nothing to approach the duplicate busbar, single or duplicate oil circuit breaker compound-filled units which can be obtained in this country, and which have made a very prominent position for themselves in power-station service.

G. L. E. Metz.

Birmingham, *December 20th*, 1925.

Assisted Wiring.

"Manufacturer's Salesman" is suffering from a complaint well known in the electrical industry. I call it "Grumblitis"; it is diagnosed by a general wail, and ignorance of the real facts of the situation, as well as a "Funk-Hole" *nom-de-plume*.

Mr. Tate, who speaks with a deep knowledge of the contracting side of the industry and with authority, has definitely stated that he is in agreement with the assisted-wiring scheme as adopted in South Shields. I know many contractors who are also in agreement with the scheme, and have heard only one speak against it, and he had a temporary "bee in his bonnet."

May I ask "Manufacturer's Salesman" to consider for one moment who has been chiefly responsible for developing the installation side of our industry for the last thirty years.

In the United States the most successful supply companies have, from experiment, found it better to use the contractor than to execute their own installation work.

Your correspondent mentions the absence of contractors in the gas industry. He is still blind to the fact that that is of tremendous advantage to the electrical industry. How many gas users visit gas showrooms, or even see them or anyone representing the gas industry? Have the gas monopolies many independent people outside themselves with a practical knowledge of gas to put in a good word for it?

The great British public has a profound dislike for a complete monopoly, as most thinking people already know.

It can be proved conclusively that immediate co-operation between all sections of our industry is the shortest cut to sound development and success.

Contractors as a body will co-operate to-day.

Will the others?

H. T. Young.

London, *December 19th*, 1925.

Replies to Correspondence.

May I ask employers who reply to advertisements in your "Situations Wanted" columns, asking for references, &c., to acknowledge receiving them and to state if there is a possibility of the applicant being suitable for the position they have to offer?

I have had two experiences lately in which this has not been done. In one case references, &c., were sent, and nothing further was heard. In the second instance, after an interview when apparently everything was satisfactory, I was told that a letter would follow in the course of a few posts. It, however, did not arrive, and a letter sent to them a fortnight after the interview, asking how the matter stood, was not even answered.

Only those people who are seeking a job know the anxiety of waiting for the postman and the disappointment when he passes the door.

Dri Cell.

December 14th, 1925.

Will "Combustion Engineer" kindly send us his name and address?—EDS. ELEC. REV.

Survey of the National Coal Resources.—An important part of the work on fuel research undertaken by the Department of Scientific and Industrial Research is a survey and classification of the coal seams in the various mining districts.

Committees have for some time been actively at work in the Lancashire and Cheshire and in the South Yorkshire areas. The Department recently appointed a committee for work in the North Staffordshire area. A further committee has now been formed to deal with the survey of the coalfields of Scotland. The Coal Owners of Scotland and the Mining Institute of Scotland are co-operating in this work.

Business Notes.

Commercial and Industrial Developments, Business Changes, Trade Opportunities, New Publicity Literature, Liquidations and Failures.

The "Electrical Review" Index.—The Index for the last half-yearly volume of the ELECTRICAL REVIEW (July to December), will shortly be published. Copies will be forwarded post free to those requiring them for binding or for reference purposes, if they will make application to the Publisher, ELECTRICAL REVIEW, 4, Ludgate Hill, E.C.

British Patents in 1925.—An estimate of the number of patent applications filed at the British Patent Office in 1925 brings the total up to about 35,000, of which about 12,250 relate to motor vehicles and internal-combustion engines. Messrs. Hughes & Young, patent agents, state that a noticeable feature of the inventions relating to motor vehicles is the large number of patent applications relating to devices for reducing the dazzle or glare of headlamps. In the latter part of the year a large number of patent applications were filed in connection with wireless apparatus. At least one-quarter of the applications filed last year came from the United States and Germany.

The Danish Electrical Market.—In a recent survey of the market for electrical appliances in Denmark, *Commerce Reports* states that the popularity of vacuum cleaners is growing, the market being dominated by Swedish, Danish and German makes. Irons are also used to a large extent, most of them being of home manufacture. Apart from these two items there are few applications of electricity which enjoy a wide use. Electrical household appliances are in most cases bought direct from the foreign manufacturer. The retailers buy from the importer, who is usually also the wholesaler, and generally situated in Copenhagen. Local firms, when undertaking the representation of foreign firms, usually require this to be exclusive to them for the whole of Scandinavia, but experience has proved that it is more satisfactory in most cases to grant a Copenhagen agent the exclusive right for Denmark only.

An E.D.A. Film Display.—The British Electrical Development Association organised a display of electrical films at Australia House recently. These depicted in a very interesting manner the production of electrical goods at the works of leading British manufacturers and also presented palatable propaganda for a number of applications of electricity. The works films included the Rugby works of the British Thomson-Houston Co., Ltd., and Messrs. Johnson & Phillips, Ltd. Two films taken under the auspices of the General Electric Co., Ltd., showing electricity at work in the home were also exhibited, while a Vickers film showed erection work in progress at the Fulham electricity works.

Strowger Automatic Telephone Manufacture.—During 1925 the following Strowger equipments were completely manufactured in Liverpool at the works of the Automatic Telephone Manufacturing Co., Ltd., and installed for the Post Office. The number of lines is given in parentheses:—York (1,700), Headingley, Leeds (1,300), Stanningley, Leeds (800), Roundhay, Leeds (900), Chapeltown, Leeds (1,300), Torquay (1,230), Paignton (690), Newport (extension) (600), Cwmbran (80), Risca (60), and Leeds, 10 trunk equipments. In addition, manual telephone switchboards and equipment have been manufactured in Liverpool and installed at:—Weston-super-Mare (880), Accrington (extension) (500), Cardiff (1,500), Maidenhead (1,120), Worthing (540), and Blackburn (extension) 2 multiple sections. A number of important Colonial and foreign orders have also been executed, including Strowger apparatus consisting of 26,900 lines and trunking equipment for Tokio.

Electric Ovens for Battleships. — The Metropolitan-Vickers Electrical Co., Ltd., informs us that four of its ovens have just been ordered for the two new battleships *Rodney* and *Nelson*, at present being built in the yards of Messrs. Cammell Laird and Armstrong-Whitworth respectively. These ovens, while similar in general construction to the standard "Metrovick" oven supplied to bakers and confectioners, embody a number of important modifications designed to meet the special conditions obtaining on board ship. This is the second order which the company has received from the Admiralty for large electric baking ovens, a somewhat smaller but similar oven having been installed on H.M.S. *Tiger* about a year ago. The electric water heating equipment for the bakeries on board the *Rodney* and *Nelson* is also being supplied by the company. Other recent installations include large ovens for Messrs. Duncan & Foster, Manchester, Messrs. W. & R. Jacob, Dublin, Messrs. E. Cookson & Sons, Ltd., Preston, and Messrs. A. D. Wimbush & Sons, Ltd., of Birmingham.

Employment During November.—The December *Ministry of Labour Gazette* says that employment in the engineering industries generally remained bad, showing very little variation from the previous month's position, although it was fairly good in the electrical branch. The overall percentage of unemployed in the industry was 11.3, whereas in the electrical section it was only 5.6, although this was an increase of 0.1 per cent. during the month. In the electrical wiring and contracting industry the proportion of unemployed persons was 9.7 per cent., a decrease of 0.5 per cent., but unemployment in the electrical cable, wire and lamp manufacturing group rose by 0.5 per cent. to 6.5 per cent.

Industrial Lancashire.—A diagram prepared by Mr. A. H. Banks, employers' secretary of the North-Western District Council for the Electricity Supply Industry, and published recently by the *Manchester Guardian*, analyses the occupations of 1,689,056 persons employed in Lancashire, according to the 1921 census. This shows that, apart from the non-industrial group, the largest number of workpeople are employed in the engineering, shipbuilding and allied trades, cotton, mining, building, &c., and railway transport following in the order named so far as classified industries are concerned.

The International Forty-eight Hour Week.—Last week a joint deputation of employers and workers in the engineering industry interviewed the Minister of Labour upon the subject of the application of the principle of the 48-hour week internationally. It had previously been maintained by the interests represented by the deputation that it was a declared obligation of the parties to the Versailles Treaty that some sort of uniformity should be arrived at. It was said that while the hours worked per week in this country were 47, in France, Germany, Belgium and Italy they were supposed to be 48, although in practice they often extended to between 50 and 60. At the prior interview the Minister asked for an adjournment to enable him to communicate with the Governments of the countries specifically mentioned, and last week he said that replies had been received from the Belgian and German Governments expressing their willingness to take part in a conference on the matter; no definite replies had been received from France and Italy, but further steps were being taken.

Tramway Employés' Strike at Burnley.—About 50 men in the Burnley municipal tramway and other undertakings ceased work last week, the Corporation having declined to grant an increase of 10s. per week in the existing wages of £3 1s. 6d., arguing that the undertaking was to grant this advance on the basic wage of £2 16s. The men contend that other municipalities of smaller size have already done what Burnley refuses to do.

Telephone Development.—The Telephone Development Association has issued a booklet setting forth the advantages of being "on the 'phone" and explaining how to obtain them. It is well and humorously illustrated.

Copper, Lead and Rubber Prices.—Messrs. F. Smith and Co. report, December 29th: Copper (electrolytic) bars, £66, 5s. dec.; ditto, ditto sheets, no change; ditto, ditto wire rods, £76, 5s. dec.; ditto, ditto h.c. wire, no change.

Messrs. James & Shakespeare report, December 29th: No change in the prices of copper bars (best selected), sheet and rod; English pig lead, £36 10s., 10s. inc.

Messrs. Edward Till & Co. report, December 29th: India-rubber, Para fine, 4s. 1d., 1d. inc.

A Japanese in America.—Doctor Keiji Ito, consulting engineer to the Toho Electric Power Company and Professor at the Tokio Institute of Technology, spent a few days recently at the East Pittsburgh plant of the Westinghouse Electric and Manufacturing Company. Dr. Ito's chief reason for visiting the United States was for the purpose of making a study of the application of motors to industrial equipment and household appliances, including heating and lighting the home, and also the study of industrial heating. When approached on the question of the use of electrical appliances in Japan, Dr. Ito stated that the Japanese were not backward in taking to electrical home appliances, and that those who could financially do so had also installed electric heating appliances in their homes. He further stated that the use of gas had been practically eliminated by electricity.

Philips' Glow Lamp Works Extensions.—In connection with the new issue of capital by the Philips' Gloeilampenfabrieken of Eindhoven, to which reference was recently made, it is stated that the proceeds of the new issue are intended for the financing of extensions at Eindhoven, as well as abroad. Among others, the company is interested in the International General Electric Company by means of an interchange of shares, while Philips Lamps, Ltd., has been formed for sales in England.

A Valve Display.—An entire window on the Oxford Street frontage of Messrs. Selfridge's premises was given over last month to the display of "Osram" valves. Twelve circular openings were cut into a proscenium, and in each of the openings a valve of nickel-plated seating was fitted. These valves lighted up in pairs. Commencing from the bottom, the first two would light up, and when these went out the next two lighted, and so on, until the two in the centre of the top cross bar followed suit, to complete the entire set of twelve. When these were extinguished the process started again. The window furniture of gold stools and a table and blue curtain hangings were arranged to emphasise the colour scheme of the blue and gold carton of the "Osram" valve.

A Battery Locomotive Order.—For the constructional work of the Ben Nevis tunnel in connection with the new power station of the British Aluminium Co., Ltd., an order for 22 electric locomotives equipped with "Exide" batteries has been placed with Messrs. Joseph Booth & Bros., Ltd., Rodley, Leeds.

Unemployment.—During the week ended December 14th the number of unemployed persons registered at the exchanges fell by 33,750 to 1,127,500. Upon the equivalent date of 1924 the total was 1,158,475. The latest total includes 912,400 men, 26,800 boys, 164,700 women and 23,600 girls.

Social Events.—The annual dinner of the staff and employés of the Maidstone Corporation Electricity Department was held on December 19th. About 70 attended and the borough electrical engineer (Mr. E. E. Hoadley) presided. The chairman of the Electricity Committee (Councillor W. H. Martin, J.P.) was prevented by illness from attending, but the vice-chairman (Councillor S. P. Sanders) and the former chairman, Mr. J. H. French, were present.

At the annual social meeting of the staff of the Ayrshire Electricity Board, held at Kilmarnock recently, Mr. W. C. Bexon, chief engineer and general manager, who occupied the chair, was congratulated on the progress of the undertaking which now has a capital of about a million and a quarter. The adoption of electricity in coal-mining, it was predicted, would give a wide outlet for electricity in the future. The A.E.B. orchestra, trained by Mr. Upton, rendered selections during the evening.

The staff of the Electric Supply Corporation, Ltd., Dumbarton, and their friends, held a whist drive and fancy dress ball on December 16th. Mr. Dixon, the company's engineer for Scotland, thanked the staff for making the event a success. Mrs. Dixon presented the whist and fancy costume prizes. Mr. Gow-Russell, the resident engineer, and Mr. Clacher acted as M.C.'s.

Trade Announcements.—MR. F. H. SOWDEN, electrical and mechanical engineer, has removed to larger premises at Alpha Street, Dewsbury Road, Leeds.

The shareholders of HOLOPHANE, LTD., have accepted a favourable offer to purchase their American and Canadian rights. This will necessitate a reconstruction for the purpose of re-arranging the share capital, and to this end the company has just gone into voluntary liquidation. The position of the ordinary trade creditors will in no way be affected as they will be paid in full. A new company is being registered bearing the same name, but the business will continue as heretofore, with the same directorate and *personnel*.

THE RADIO EQUIPMENT CO. has opened demonstration and showrooms at Market Avenue, Huddersfield.

MESSRS. J. R. & A. H. BROOKING, who have purchased an electrical business at 44, High Street, Exeter, from the trustee under a deed of assignment from Messrs. Bird & Ewings, announce that that business will in future be known by the name of Brooking Bros. They wish to have a set of up-to-date electrical catalogues at the above address.

THE FOOLPRUFE ACCUMULATOR CO., LTD., Kettering Road, Market Harborough, desires to receive catalogues of electrical fittings and accessories.

MR. O. A. BROWN has opened an electrical and radio engineer's business at 78, West Princes Street, Helensburgh.

MR. J. A. BROOK has taken over new central premises at 24, John William Street, Huddersfield (Telephone No. 2929), to cope with increased business in electric lamp locks. He asks for copies of manufacturers' lists of electrical goods for his factoring business.

MR. ALEXANDER MILLER announces that he has given up business in Maidstone, and has purchased as a going concern the Central Garage (Newcastle-on-Tyne), Ltd., Carliol Square, Newcastle-on-Tyne. He was for five years chief draughtsman with Messrs. Mavor & Coulson, and was subsequently with various other well-known electrical manufacturing companies.

Some time ago (ELECTRICAL REVIEW, June 26th, 1925, p. 1015) we referred in some detail to the amalgamation of two of the oldest firms in the electrical fittings trade—Messrs. OSLERS (established in 1807) and MESSRS. FARADAYS (established in 1814). The developments that have taken place since the amalgamation include the opening of new branches at Glasgow, Manchester, Cardiff, and Belfast. The address of the company—Osler & Faraday, Ltd.—has now been changed to Lanthorne House, 89-91, Newman Street, Oxford Street, London, W.1.

Catalogues and Lists.—THE METROPOLITAN-VICKERS ELECTRICAL CO., LTD., Trafford Park, Manchester.—Descriptive Leaflet No. 750/1-1, dealing with the Metropolitan-Vickers coal-cutter protection system. Fully illustrated.

THE MARCONIPHONE CO., LTD., 210-212, Tottenham Court Road, W.1.—A coloured poster advertising the company's two-valve receiver and the "Sterling Dinkie" loud speaker.

MESSRS. RICHSON & CO., LTD., 113, Oxford Street, W.1.—A well-illustrated catalogue (72 pp.) of artistic lighting fittings of all kinds—electroliers, bowls, shades, standards, brackets, statuettes, &c. Many of the illustrations are in colour.

THE LODGE FITTINGS CO., LTD., 57, Albert Road, Aston, Birmingham.—A price list of electric signs of various patterns.

THE CHLORIDE ELECTRICAL STORAGE CO., LTD., Clifton Junction, near Manchester.—The Christmas number of the "Chloride Chronicle," containing numerous notes and articles upon "Exide" batteries. The publication is profusely illustrated.

MESSRS. R. M. PAPELIAN, LTD., Wolseley House, Piccadilly, W.1.—An illustrated pamphlet dealing with the "Autopulse" fuel-supply system for i.c. engines which is based on a magnetic principle.

W. T. HENLEY'S TELEGRAPH WORKS CO., LTD., Holborn Viaduct, E.C.1.—Catalogue W.L.5, containing illustrations and particulars of "Isco" cut-outs for house services, &c. Three ranges are dealt with, *viz.*, 15-30 A, 30-60 A, and 60-120 A.

MESSRS. HERBERT MORRIS, LTD., Loughborough.—Book 101, containing an illustrated description of the "Morris" electric runway.

THE HACKBRIDGE ELECTRIC CONSTRUCTION CO., LTD., Hersham, Walton-on-Thames.—A well-illustrated catalogue of the company's transformers.

BRITISH INSULATED CABLES, LTD., Prescot, Lancs.—List No. P.194, illustrating and describing "Prescot" a.c. prepayment meters.

THE GENERAL ELECTRIC CO., LTD., Magnet House, Kingsway, W.C.2.—A mailing card bearing illustrations and prices of "Osram" valves.

THE SUN ELECTRICAL CO., LTD., 118-120, Charing Cross Road, W.C.2.—An illustrated list of display lighting equipment. It contains useful data on the subject of shop-window lighting, &c. Also a leaflet advertising "Bowyer-Lowe" radio products.

Calendars, Diaries, &c.—MESSRS. C. A. PARSONS & CO., LTD., Newcastle-upon-Tyne, have sent us a set of monthly date sheets for 1926, each of which bears an illustration of the company's turbines and other products.

THE LIVERPOOL ELECTRIC CABLE CO., LTD., of Linacre Lane, Bootle, Liverpool, has sent us one of its wall calendars with monthly slips and a sea view in colour.

MESSRS. AITON & CO., LTD., of Derby, have issued a large artistic wall calendar with monthly slips placed inconspicuously beneath a charming reproduction of "Marigold" from a pastel by I. M. Cohen.

A "memory jogger" has been sent us by the POWER MACHINERY TRADING CO., 17, Queen Victoria Street, E.C.4; this is a leatherette bound memoranda block.

A calendar received from the MARCONIPHONE CO., LTD., bears a portrait of Senatore G. Marconi, and monthly date slips.

A neat and human calendar has been received from MESSRS. FRANK V. COLLINS & CO., of 155, Kingston Road, Wimbledon, S.W.19.

A fine view in colour of "the longest electrical overhead span in the British Empire," very finely produced in the form of a wide wall calendar with the complete year in small monthly spaces beneath the picture, has been received from CALLENDER'S CABLE & CONSTRUCTION CO., LTD., of Hamilton House, E.C.4. The view shows a mile of route of overhead main at Blaengarw, South Wales, and includes four spans of 2,800, 325, 475 and 1,600 feet respectively.

Bankruptcy Proceedings—A. A. WATMOUGH, trading with another at 41, Town Street, Horsforth, near Leeds, and 1, Back James Street, Harrogate, electrical engineer.—The application for discharge of this debtor was heard on December 21st at the County Court House, Leeds; the proceedings took place in 1921. The Official Receiver supported the application, and the discharge was granted subject to debtor's consenting to judgment for £50.

H. L. WOOD, electrical engineer, 7, Taswell Street, Southsea, and late of Elm Grove, Southsea.—First meeting, January 8th, at the Official Receiver's offices, 87, High Street, Portsmouth. Public examination, February 1st, at the Court House, Portsmouth.

L. A. RADFORD, electrical engineer, 50, Welford Road, Leicester.—Trustee, Mr. E. Barlow, Official Receiver, 1, Berridge Street, Leicester, released December 14th.

W. K. M. WILSON, wireless apparatus dealer, 1, Mount St. Heanor, Derby.—First and final dividend of 3½d. in the £, payable at the Official Receiver's offices, Nottingham, on January 4th.

J. E. ELLIOTT and J. M. ELLIOTT (J. E. Elliott & Co.), electrical engineers, 12, Broad Street, Oxford.—Trustee, Mr. W. J. H. Boyle, Senior Official Receiver, Carey Street, W.C., released December 18th.

J. F. GUEST (L. D. & J. Guest and Guest & Robinson), plumber, electrician, &c., 97, Great Horton Road, and Barker-end Road, Bradford.—Trustee, Mr. G. S. Smith, 17, Piccadilly, Bradford, released December 4th.

F. H. P. HOOLAHAN (Holloway Bros.), electrical engineer and instrument maker, The Hale, Highams Park, and 299, Holloway Road, N.—First and final dividend of 1s. 8d. in the £, payable at Carey Street, W.C.

Company Liquidations.—PARK ROYAL ENGINEERING WORKS, LTD.—The liquidator of the company, Mr. G. D. Pepys, Official Receiver, states that he is applying for his release; objections should be addressed to the Board of Trade within 21 days from December 19th. Mr. Pepys reports that the assets have been sold by the Receiver for the first debenture holders, who states that after the payment of the costs and the claims of the first debenture holders there will only be a small balance to be paid over to the second debenture holders. There will therefore be no funds available for distribution amongst either the unsecured creditors or shareholders.

WEST LANCASHIRE ELECTRICAL CO., LTD.—A meeting of members is called for January 30th at the offices of Messrs. Davies and Crane, Houghton Chambers, Southport, to hear an account of the winding up from the liquidators, Messrs. J. A. Bond and J. F. Warburton.

BELGRAVIA ELECTRICAL CO., LTD.—Winding up voluntarily. Liquidator, Mr. W. H. Lovatt, 21, Ironmonger Lane, E.C.

MARINE AND MECHANICAL ELECTRIC WELDING CO. (CARDIFF), LTD.—Winding up voluntarily. Liquidator, Mr. L. C. F. Robson, 146, Bishopsgate, E.C. Meeting of creditors January 11th, at the offices of the liquidator. Particulars of claims to be sent to the liquidator by February 8th.

For Sale.—Ipswich Board of Guardians invites offers for generating plant consisting of :—Two suction gas engines and producer plant, dynamos, motor booster, switchboards, &c., due to changing over to town supply. Messrs. S. D. Harrison and Sons have for disposal several steam generating sets, one Weir condenser, pumps, &c. The Liquidators of the British Empire Exhibition, Wembley, invite offers for surplus electrical equipment, consisting of motor generators, cables, meters, cut-outs, projectors, &c. Edinburgh Corporation Electricity Department has for disposal a quantity of scrap metal, &c., lying at the McDonald Road station. Mr. H. J. Shaw will sell by auction on January 7th, at 85, Newington Causeway, S.E., an electrical contractor's stock, and on January 20th, at 13, High Holborn, W.C., the stock of an electrical and wireless goods factor. (See our advertisement pages to-day.)

Book Notices.—We have received a copy of the "Interim Report on Artificial Light and X-Ray Therapy" (H.M. Stationery Office, price 1s.), issued by the Scottish Board of Health. Apart from dealing at length with questions relating to the application and administration of radiant energy for medical purposes, much useful information is contained on the theoretical considerations of the subject. The division of the spectrum shown diagrammatically adds to the interest of the publication. Ultra-violet radiation and treatment are dealt with extensively.

"Six-valve Supersonic Heterodyne Receiver." Pp. 21, with blue prints; illustrated. London: Igranic Electric Co., Ltd. Price 2s. 6d.—This is an instructional carton containing a fully-illustrated handbook, full-size lay-out drawings, wiring diagram, and drilling template for the construction of a six-valve receiver from the Igranic supersonic heterodyne outfit, which is a very attractive one. The set is very fully described in the illustrated handbook that is enclosed in the carton, and contains theoretical notes, a general description, and operating data. It is replete with diagrams and descriptive matter concerning the functions of a receiver built up under this system, and with interesting detail regarding the various methods of operating to the best advantage. A very valuable feature of the handbook consists of the constructional notes, which touch on the various operations of assembling and the ordered sequence of wiring, and the fitting up of the components. It will be found also that the series of questions and answers that apply to the many problems connected with the operating of a receiver on supersonic principles will prove most valuable to all who are interested in this phase of radio reception. The instructional carton is obtainable from all Igranic dealers.

"The Henley Telegraph," September-December, 1925. London: W. T. Henley's Telegraph Works Co., Ltd. Price 6d. net.—The excellent literary standard of this bright little journal is maintained in the current issue, which contains a number of interesting and amusing articles. We were particularly interested in a description of a golf match played in the vicinity of our offices—but we don't recollect it.

"Amplion Magazine." Pp. xvii+73. Vol. 1, No. 3; illustrated. London: Alfred Graham & Co. Price 1s. net.—Besides the lighter fare, this, the first Christmas number of a well-printed and interesting house organ, contains several items of technical and practical value.

"Cosmos Radio Valves: A Talk to Valve Users." Pp. 20; 13 figs. Manchester: Metro-Vick Supplies, Ltd.—The somewhat bewildering array of thermionic valves now obtainable makes the provision of proper descriptive and explanatory literature to guide the purchaser in his choice of suitable types of valves to perform particular functions imperative. The object of writing the article which gives its title to this booklet was to explain, in language that can be understood by the non-technical reader, the meaning of the various technical terms and data generally set out in valve manufacturers' catalogues, and to show how the various constants can be calculated from the properties and performance of a valve, deduced from its published characteristic curves. So far as we are aware, nothing quite like this booklet has been attempted before; it should be of considerable interest to valve users, both amateur and experimental.

"*Journal* of the Institution of Production Engineers." Vol. V, No. 2, December, 1925. Price 1s.—In a short article on electrical gauging devices the principles of a few examples of electrical sizing indicators, employed during the processes of machining or grinding, and electrical gauging devices for testing finished components, are briefly described.

"The *Journal* of the South African Institution of Engineers." Vol. XXIV, No. 5. December, 1925. Price, 2s.

"Electrical Engineering for Mining Students," by G. M. Harvey. Pp. vii + 156; figs. 108. London: Sir Isaac Pitman and Sons. Price, 5s. net.

"*Journal* of the American Institute of Electrical Engineers." Vol. XLIV. No. 12. December, 1925. New York: The Institute. Price, $1.

A Swedish Re-organisation.—At an extraordinary meeting of the shareholders, held on December 19th, it was decided, says *Goteborgs Handels och Sjofartstidning*, to liquidate the Elektriske A.B. Chr. Bergh and Company. At the same time an agreement was entered into with a new company under the title of the Nye Elektriska Aktiebolag Chr. Bergh and Co., which has taken over the assets and liabilities and is continuing the business on the same lines.

Unemployment in Germany.—It is reported that on December 1st the number of unemployed persons in Germany was about 670,000, an increase of 200,000 in less than a month. Unemployment was most marked in the building trades.

French Electrical Experts in Madagascar.—At the request of the Governor of the island, a commission of French electrical experts, consisting of representatives of Schneider & Cie., La Compagnie Francaise d'Exploitation des Procédés Thomson-Houston, and the Compagnie Générale des Colonies is, it is reported, about to visit Madagascar with the object of studying the question of the electrification of the Tananarivo-Tamatave railway and also the Batsileo line. It is also proposed to supply the district traversed with electricity for lighting and power purposes.

Local Exhibition.—PREESALL.—The Urban Council Electricity Committee, in conjunction with the General Electric Co., Ltd., Manchester, held an electrical exhibition in the Parochial Rooms, Preesall, recently. The numerous domestic exhibits covered a wide field and each day a lady expert gave demonstrations in cooking and baking by electricity. The exhibition is said to have had a very beneficial effect in stimulating the sale and hire of electrical appliances in the district.

A Canadian Power Plant Contract.—Eight firms submitted bids for the new 5,000-h.p. turbines and generators required by the Winnipeg Hydro to complete the installation of equipment at the Point du Bois power plant. The Canadian Boving Company, Lindsay, Ont., submitted the low bid of $88,920 for the turbines. Other bidders were the John Inglis Company, of Toronto, the Canadian Allis-Chalmers Company, and the Canadian Vickers Company, Montreal. The Swedish General Electric Company, bidding through its Canadian office in Toronto, tendered the lowest bid for generators—$143,700. Other bidders for this equipment were the Canadian General Electric Company, C. A. Parsons & Co., Ltd., and the Canadian Westinghouse Company.—*Electrical News* (Toronto).

New Canadian Companies.—Affiliated Engineering Companies, Ltd., is the name of a concern recently registered in Toronto with a capital of $150,000 to carry on, *inter alia*, the business of electrical engineers and contractors.

Niagara Lamps, Ltd. (capital £40,000) has been formed in Hamilton, Ont., to carry on the manufacture of electric lamps, &c. Other companies recently constituted in Canada are the Skeely Electric Mfg. Co., Ltd. (Montreal), and Beeby Thermos Ranges, Ltd. (Montreal, capital $750,000), heating apparatus manufacturers.

German Tariff Reductions.—The *Board of Trade Journal* for December 24th published a list of articles, which, by the provisions of a commercial treaty between Germany and Italy, are to be subject to a lower rate of duty upon importation into either country. By virtue of the Anglo-German commercial treaty similar British goods entering Germany will enjoy the lower rates. The list includes "Dynamos (generators), except lighting and ignition dynamos for motor vehicles and except starters for combustion engines." The duty on articles under this head weighing 10 kg. or less is reduced from 80 to 40 Rm. per 100 kg.; on articles weighing more than 15 and up to 25 kg. the reduction is from 40 to 23 Rm. per 100 kg. Electrically-heated apparatus for making coffee is subject to the following duty reductions :—Weighing more than 3 kg. each, from 60 to 50 Rm. per 100 kg.; 3 kg. or less, from 75 to 70 Rm. per 100 kg.

Aluminium Production.—According to a tabular statement published in the Essen *Gluckauf*, the production of aluminium throughout the world amounted to 64,800 tons in 1913. Switzerland is credited with 12,000 tons of this total, France with 14,500 tons, Great Britain with 7,600 tons, Norway 1,500 tons, Italy 800 tons, the United States 22,500 tons, and Canada with 5,900 tons. The figures and countries of production for the past two years are given below :—

	1923. Tons.	1924. Tons.
Germany	15,900	18,700
Switzerland	15,000	20,000
German Austria	1,500	2,200
France	17,000	18,500
Great Britain	8,000	12,000
Norway	13,300	22,000
Italy	1,500	2,000
United States	85,000	85,000
Canada	10,000	8,000
Total	167,200	188,400

New Belgian Companies.—A new company has lately been formed in Brussels with a capital of 1,600,000 fr., and the title Société Belge des Accumulateurs Fulmen.

The S.A. Belge pour l'Equipement Electrique des Véhicules has been formed in Brussels with a capital of 250,000 fr., to manufacture and sell all kinds of electrical equipment for vehicles.

The Etablissements Paulet (S.E.P.) has been constituted in Brussels for the construction, equipment, and sale of electrical and mechanical systems, &c. (Capital, 250,000 fr.)

The S.A. Fluoris is another company recently formed at Brussels to undertake electric lighting by means of fluorescent tubes. (Capital, 200,000 fr.)

E.D.A. Activities.—The E.D.A. has produced a card relating to its advertisements which are to appear in the ELECTRICAL REVIEW and other electrical journals during this year. The card not only gives the dates, but also reproduces the distinctive border which is being employed for each advertisement.

New Italian Companies.—Among the new hydro-electric undertakings recently organised in Italy are the Società Idro-Elettrica del Sabato, Benevento, capital 162,000 lire; and La Società Idro-Elettrica del Tul, Travesio, capital 421,000 lire.

The Electrical Age.—The Sunlight League has issued No. 2 of *Sunlight*, "a journal of light and truth" (December, 1s.). One of the articles is by Mr. D. N. Dunlop. It is entitled "Coal and Sunlight," and concludes by pointing to the necessity of avoiding raw coal combustion wherever possible, the substitution of smokeless fuels, and the introduction of a motive force into industry which will be clean, efficient, elastic and economic in operation. "Electricity," he says, "supplies this last and, from many points of view, the electrical age may be of greater value to the progress of humanity and of human existence, material, physical and even social, than any other age that has come and gone—bronze age, iron age, or steam age." Elsewhere in the journal is a reference to the first annual dinner of the Sunlight League held in May last, when the money to cover all expenses of the dinner was borne by "our very generous friends, the British Electrical and Allied Manufacturers' Association," Mr. D. N. Dunlop being "our host."

An Analysis of Unemployment.—In the *Ministry of Labour Gazette* for December the unemployment statistics from July, 1923, to October, 1925, are analysed according to groups and other circumstances; the result is illuminating in view of the fact that we are accustomed to look at the unemployment figures as a whole It is seen, for instance, that the coal mining industry, with its wide fluctuations, is the all-important factor of the situation. Indeed, during 1925 the curve of unemployment in the coal industry was reflected in a remarkable way in the general unemployment curve. Seasonal fluctuations are clearly illustrated, but it is observed that during 1925 the variations were far less violent than in the preceding year. A feature of the general curve is the remarkably low level reached in the second quarter of 1924, a position which has not been regained since. In June, 1924, the total of unemployed fell to 1,040,000; the lowest level reached in 1925 was just over 1,220,000 in April and May. The general and marine engineering curve is practically a gradually descending straight line, showing a very slow improvement.

Patent Application.—Application has been made for the restoration of patent No. 27,355 of 1913 granted to F. L. Hollister for improvements in or relating to magneto-electric machines.

Swedish Enterprise in Russia.—According to statements attributed to Mr. A. Linden, director of the Allmanna Svenska Elektriska A.B., a commencement of the supply of electricity from the Volkhoff hydro-electric works to Leningrad is expected to be made next May. The electrical equipment for this large station has been supplied by the Swedish company, while orders for electrical machinery and apparatus have also been received by the A.S.E.A. for other places in Russia. Mr. Linden stated that the company had initiated negotiations with the competent authorities with a view to securing a new concession for the workshops which the company carried on at Yaroslav before the revolution, the concession aiming not only at manufacturing, but also the right of free disposal of the manufactures. The idea was that the works in question, which in recent years had only been carried on by a Russian company on a small scale with the A.S.E.A. as an interested party, should be restored to the level of production which formerly prevailed, so that the number of persons employed would exceed 1,000. According to the concession proposal, the works would be under Swedish management and have an administration composed of certain percentages of Swedes and Russians and would be financed by the Swedish company. Confirmation of the scheme is also forthcoming from Russian sources, which announce the arrival in Leningrad of representatives of the Swedish company in the third week in December, together with Mr. Ericsson. In conversation with the representative of a Moscow newspaper, the chief representative of the Swedish company is reported to have stated that the construction of the Yaroslav works, which was in progress at the beginning of the revolution, was only stopped in November, 1917. This particular works was the only foreign undertaking in Russia which had not been subject to nationalisation, as the A.S.E.A. during recent years had executed orders for the Soviet Government. The completion of the works was to be commenced immediately on the grant of the concession from the General Concessions Commission, and some 1,500 workpeople would be employed on the production of generators, transformers, and other electrical equipment.

United States Electrical Exports.—In a recent issue of *Commerce Reports*, the exports of electrical goods from the United States during the first nine months of 1925 were reviewed. There was a slight decline in comparison with the previous corresponding period—from $63,281,553 to $63,031,943. There was a substantial decrease in transformer shipments which was not fully offset by rises in exports of a.c. generators and parts and steam turbine sets. Electric locomotives for mines and railways both showed declines; the former fell in value from $1,887,668 to $146,496. There were also small decreases in motor exports, while shipments of starting and controlling equipment for industrial motors fell in value by 50 per cent. On the other hand, there were important rises in the exports of radio equipment and associated lines, and domestic appliances. Lamps and lighting fittings, wiring materials, and insulated wires and cables, all showed substantial gains. The review proceeds to deal with the United States' customers and it is said that electrical exports to Europe show a satisfactory trend reflecting the improvement of economic conditions. Great Britain was again the leading European buyer, while Spain was second with 50 per cent. more than France, which occupied the third place. The strong position held by the United States in the South American markets was maintained, and it is stated that the influence of American-controlled public-utility developments in Panama and Guatemala is undoubtedly the reason for the growing importance of those markets as compared with others. In conclusion, our contemporary says:—"Considering the electrical export trade as a whole, the distribution throughout the world continues quite uniform, though its strength this year is to some extent maintained through the increased volume of radio exports."

United States Radio Exports.—The world-wide interest in radio is reflected in an increase of nearly 100 per cent. in the value of radio apparatus exported from the United States in October as compared with the same month of 1924. For October, 1925, Department of Commerce figures show the value of radio apparatus exported as $1,317,846; in October, 1924, the value of exports was $760,249. For the first ten months of 1925 radio exports were valued at $7,659,000.—*Reuter's Trade Service* (Washington).

A Striking Poster.—We reproduce below the wording of an attention-compelling poster which is being employed by the Torquay Corporation Electricity Department:—

DO
YOU
WANT
A BATH

JUST WHEN YOU FEEL LIKE IT WITHOUT HAVING TO WAIT FOR THE WATER TO GET

HOT ?

THEN HIRE

A BASTIAN ELECTRIC GEYSER

FROM

THE TORQUAY CORPORATION ELECTRICITY DEPT.

FROM 3/6 PER QUARTER.

A constant supply of Scalding Hot Water available day and night at an average cost of 3/- per week.

A Greenock Blotter.—The Greenock Corporation Electricity Department has issued an attractive blotter calling attention to the benefits of electricity. A coloured view of a fishing village appears on the card.

Lighting and Power Notes.

Ayrshire.—EXTENSION OF TIME.—The Ayrshire Electricity Board has intimated that it is to apply to Parliament to extend the time as now limited by the Ayr Burgh Electricity Act, 1922, for the compulsory purchase of land required for the purposes of the electricity undertaking authorised by that Act.

Barking Town.—EXTENSION OF SUPPLY.—The Electricity Committee has agreed to a scheme for the extension of electricity supply to the Eastbury area, at a cost of £22,100, and a loan of £4,600 is to be sought for the last portion of the scheme, which includes the erection of sub-stations in River Road. The Housing Committee has decided to wire 59 houses on the Eastbury estate for electricity.

LOANS SANCTIONED.—The Committee has obtained sanction to the borrowing of £5,500 for buildings and £10,000 for plant.

ELECTRICITY CHARGES.—The Electricity Committee has decided that, as and from the termination of the current quarter, the maximum demand charges for a.c. power supply shall be altered to:—35s. per kVA of the maximum demand per quarter, plus ¼d. per kWh, subject to the standard discount, and that the treasurer and engineer shall report on the question of the revision of the charges for d.c. supply.

Bo'ness.—LOAN.—The Town Council is applying for sanction to a loan of £1,200 for cables and meters.

Canada.—ELECTRICAL DEVELOPMENT.—According to the *Electrical News*, the Manitoba Power Co. now requires the immediate installation of a new unit of 28,000 h.p., in addition to the 56,000 h.p. now in operation, as it has received a contract from the Spanish River Pulp and Paper Co. for the supply of approximately 30,000 h.p. for a new mill. It is also reported that the power company will proceed with the construction of a fourth unit of 28,000 h.p., thus bringing its total output up to 112,000 h.p.

Chelmsford.—ELECTRICITY SUPPLY.—At a recent meeting of the Town Council it was decided not to purchase the Electric Supply Corporation's undertaking at the estimated purchase price of £75,000. Efforts will be made to arrange for the company to continue to supply electricity under a scheme that would limit profits and enable the Corporation to acquire the undertaking at a future date upon reasonable terms.

Continental.—BELGIUM.—The Société Saboterie Mécanique, of Presgaux, Hainaut Province, in order to utilise the waste wood resulting from the manufacture of sabots, has decided to establish a power station consisting of three 250-h.p. gas engines and dynamos and one set of 120 h.p. The necessary gas for the engines will be furnished by gas producers in which the waste wood will be utilised. Negotiations are in progress for the supply of electricity from the station to 34 villages in the district.

Croydon.—LOANS.—The Electricity Committee has received sanction to the borrowing of £1,360 for feeders, and is applying for a further loan of £1,500 for domestic apparatus to be let out on hire.

STREET LIGHTING.—The Corporation has decided to convert 100 gas lamps to electricity at a cost of £1,411.

Faversham. — NEW ELECTRICITY CHARGES. — The Town Council has adopted the following new scale of charges for electricity for power:—First 12,500 kWh per quarter, 3d. per kWh; next 37,500 kWh, 2d.; beyond this amount, 1¾d. per kWh.

Glasgow.—PROGRESS DURING NOVEMBER.—The Glasgow Corporation electricity manager reports that 165 houses were wired in November, bringing the total to 1,606, and that the applications for the hire of appliances numbered 659, bringing the total to 9,074.

NEW SUB-STATION.—The Electricity Committee has recommended the purchase of land in Ibrox as a site for a static sub-station.

Grange-over-Sands.—ELECTRICITY SCHEME.—The Urban District Council has approved of an electric lighting scheme submitted by the consulting engineer, Mr. Burnett, and application is to be made for sanction to a loan of £8,200 to cover the cost. The mains and services of Messrs. Wilkinson are to be purchased for £2,000, and 40 street lamps are to be converted from gas to electricity.

Huddersfield.—ELECTRICITY CHARGES.—The Electricity Committee has received a deputation from the Huddersfield Chamber of Trade asking that the charges for electricity for the lighting and heating of shops should be reduced. The Committee has decided to consider the matter at a special meeting to be held at the end of the current financial year.

Irish Free State.—LUCAN.—The electricity supply for Lucan and surrounding districts, which was discontinued with the suspension of the Dublin-Lucan tramway service, was recently restored by arrangement with the Dublin United Tramway Co.

Keighley. — ELECTRICAL DEVELOPMENT.—The Corporation Electricity Committee has recommended that work be proceeded with at once upon the erection of a transmission line from Eastburn foundry and the laying of distribution mains for general supply in the township of Sutton. It is also recommended that an agreement be entered into between the Corporation and the Haworth Urban District Council for the supply of electricity to the Council. It is proposed that, where desired by the consumer, electricity shall be supplied by the Corporation to private houses only through pre-payment meters at 6d. per kWh with no meter rent.

London.—BATTERSEA.—The Electricity Committee is to proceed with the following works:—Services for electric lighting to 54 premises, £514; renewing the special mains to the Town Hall and Shakespeare Theatre in connection with the work of replacing the distributors on the north side of Lavender Hill, £521; replacement of old vulcanised bitumen distributors by three-core paper insulated and armoured cables—Park Road, Bridge Road, and Queen's Road—£2,448.

Mexborough.—LOAN.—The Urban District Council is applying for sanction to the borrowing of £20,000 for the extension of the plant at the generating station.

Millom.—APPLICATION FOR ORDER REJECTED.—The Urban District Council has been notified by the Electricity Commissioners that owing to the industrial position of Millom they cannot see their way at present to grant the Order for the electricity scheme, which it is estimated would cost from £10,000 to £12,000.

Nelson.—ELECTRICITY IN BULK.—The Electricity and Tramways Committee has received a communication from the Barnoldswick Urban District Council asking for terms for a bulk supply of electricity, and has recommended that a supply be given and that the Generating Station Sub-Committee consider the question of terms with power to act.

Peterborough.—LOAN.—The Corporation Electricity Committee is applying for sanction to a loan of £2,000 for the provision of meters.

Preesall. — INAUGURATION OF SUPPLY.—The electricity supply for the town was formally inaugurated on December 19th.

Price Reductions.—Reductions in the charges for electricity have been made or recommended in the following districts:—

WALTON AND WEYBRIDGE.—*Urban Electric Supply Co., Ltd.*—Lighting: From 11d. to 9d. per kWh.

FULHAM.—Lighting: From 4½d. to 4¼d. per kWh. Power: From 1¼d. to 1⅛d. per kWh.

DARLINGTON.—Lighting: All energy used during the lighter eight months, from 2d. to 1½d. per kWh, and one kWh at 1½d. (instead of 2d.) during the darker months for every two kWh consumed during the lighter months, and 3½d. per kWh for all additional electricity consumed during the darker months. Power: First 3,000 kWh per quarter, 1d. per kWh, and ¾d. per kWh for energy in excess of this amount.

Plymouth.—NEW PLANT.—It was reported at a recent meeting of the Corporation Electricity Committee that the Electricity Commissioners had sanctioned the extension of the generating station at Prince Rock by the installation of a 6,000-kW turbo-alternator and the necessary auxiliary plant. Cable extensions were authorised by the Committee at an estimated cost of £1,397.

Rothbury.—ELECTRICITY SUPPLY.—The Rural District Council has agreed to support the application of the Newcastle-upon-Tyne Electric Supply Co., Ltd., to the Electricity Commissioners for sanction to distribute electricity within parts of the rural district.

Stoke.—ELECTRICITY SUPPLY.—The Town Council has under consideration a request from the Wolstanton Urban District Council for a supply of electricity at May Bank.

The Electricity Committee is to extend the mains in the Hanley area at a cost of £2,800, and in the Burslem area at an estimated cost of £4,000. A site has been obtained at Longton for the erection of a sub-station.

Stone.—SPECIAL ORDER.—The Urban District Council has passed a resolution authorising the Clerk to make application for the Special Order, for which the Council is applying, to be extended so as to include the parishes of Stone Rural, Darlaston, and Trentham. The Stone Rural District Council has decided to make no objection.

Walsall.—ELECTRICITY EXTENSIONS.—The Town Council has authorised the Electricity Committee to proceed with extensions of mains, and the installation of transformers, switchgear, &c., on consumers' premises at a total estimated cost of £1,750.

Willesden.—NEW PLANT.—The electrical engineer has reported that additional feeder cables are required in the Harlesden area, and estimates that the cost will be £4,000 for the extension of the sub-station and provision of a 1,500-kW rotary converter and necessary switchgear, and £4,152 for laying and jointing the feeder cables.

LOAN.—The Electricity Committee is applying for sanction to the borrowing of £25,000 for mains and services.

Wolverhampton.—TRANSFER OF UNDERTAKING.—The Town Council has agreed to transfer its generating station to the Joint Electricity Authority for the West Midlands, for which together with its portion of the main transmission line to Ocker Hill, the Council will receive £379,550.

Tramway and Railway Notes.

Cheadle and Gatley.—TRAMWAY LINKING-UP.—The Urban District Council has agreed to receive a deputation from Manchester Corporation to discuss the question of powers being obtained for joining up the city tramway system with the Council's existing routes.

Continental.—PORTUGAL.—It is announced that a Spanish syndicate has secured a concession for the construction of eight underground electric railways radiating from a central point in Lisbon. To supply the necessary power a hydro-electric station is to be established on the River Zezere at El Cabril, about 100 miles from the town. It is estimated that 20,700 h.p. is available.

Croydon.—NEW EQUIPMENT.—The Tramways Committee has recommended the purchase of tramway equipment at a cost of £7,600 in connection with the through-running arrangements with the London County Council.

Southern Railway Electrification.—The Southern Railway Company announces that the alterations to the track and stations, consequent on the coming electrification of the suburban services to and from Cannon Street, will begin on different parts of that line on January 1st, and that it will be necessary to make certain alterations in the morning and evening trains. Embraced in the portion of the company's system affected by these alterations are the main line, *via* Chislehurst to Orpington; the line from St. John's, through Catford Bridge and New Beckenham, to Addiscombe; the Elmer's End to Hayes branch; and the Grove Park to Bromley North branch. It is hoped that these lines will be electrically operated by the end of February. The section from London Bridge to Charing Cross, *via* Waterloo, is ready for opening, and will be brought into use at the same time as the section from Cannon Street to London Bridge, about to be taken in hand. At Cannon Street the work involves the reconstruction of the track, considerable alterations to the junction outside the station, and the closing down of locomotive depôts, to make room for electric sub-stations.

Modern Lighting in Ancient Buildings.

The Recent Lighting by Electricity of two Notable Cathedrals.

PROBABLY if it were realised more fully that electric lighting could be introduced into some of our fine old buildings without in any way detracting from their appearance, and indeed, with the result of exhibiting to better advantage their architectural beauty, more

Fig. 1.—Nave, Looking West, Canterbury Cathedral.

churches, cathedrals, and such buildings in this country would now be illuminated by means of electricity. The problem is not only to provide sufficient light for the purposes for which they were built, but also to enable the beautiful craftsmanship usually found in places out of the range of ordinary lighting, to be seen from all positions.

The Lighting of Canterbury Cathedral.

An admirable example of such an installation may be seen in the Cathedral at Canterbury, where the first section of a scheme for the revision of the artificial lighting has recently been finished. The portions of the building so dealt with are the nave and transepts, where the sources of lighting have been placed directly and centrally overhead. The interior roof construction of the nave consists of Gothic arches terminating in centrally placed rosettes at the apex, at a height of some 80 ft. above the ground, and separated by intervals of about 20 ft. It is in the rosettes that the electric lighting fittings are nested. There are eleven of these in all; each consists of a small silvered-glass parabolic reflector, 10 in. in diameter, directing the upper hemispherical rays to the floor level, the lower rays being utilised to illuminate the adjacent ceiling arches and the upper parts of the supporting columns. The power of the rays directly below each source of light amounts to 10,000 c.p.; between that point and 10 degrees from the vertical it falls to 5,000 c.p., and then falls rapidly to the normal power of the lamp. Thus the high-power rays can only fall on the eye when it is looking abnormally, directly upwards. The illumination to which the eyes of the general public are exposed, even when looking at the ceiling arches, is from 500 to 1,000 c.p., the visible area of each source being 25 sq. in.

The results are thus free from any disadvantages of glare, and the illumination is claimed to be wonderfully even, such shadows as are produced being sufficient to give a necessary relief to the architecture. Shadows at the floor level of the nave are noticeably absent, the illumination at all parts being ample for reading in comfort. The ceiling lighting of the aisles will eventually be supplemented by fittings similarly placed to those in the nave. All irregularities of illumination, such as striation, so often produced by highly-directive reflectors, are avoided, it is claimed, by the use of "Multiplane" reflecting surfaces, an invention patented by Mr. Haydn T. Harrison, who has been responsible for the design of the installation. In the side transepts, where the area covered by a single fitting is greater, "Holophane" concentrating reflectors have been adopted. Each fitting is equipped with a 500-W gasfilled Osram lamp, with its lower part sprayed to prevent any possible direct view of the filament.

The fittings are of special design to conform with the construction of the roof. The only parts of each fitting showing are its reflector and the lower part of the lamp. The stonework of the arches is pierced at each point by a hole 5 in. in diameter, to a depth of from 18 to 24 in. The upper part of each fitting forms a copper chimney, passing through the hole, and thus allowing the heat from the lamp to escape into the roof. The main framework of the fitting is attached to the cylinder at its lower end, the upper end being provided with a shackle to which is attached a steel suspension rope which, in conjunction with a safety winch, is

Fig. 2.—Nave, Looking East, Canterbury Cathedral.

used for lowering the fitting to near the floor level for the purposes of cleaning, effecting renewals, &c. Each fitting is provided with a two-pin plug socket placed with the winch in the roof; an extra safety clamp is also supplied. The wiring in the roof is run

in heavy-gauge screwed-steel conduit along the cross beams. Each fitting is controlled by a d.p. ironclad switch-fuse. The installation is arranged in three main circuits, which are controlled from the main switchboard in the crypt. A dimmer is installed to give the same even illumination at about one-third of the intensity at times when a subdued light is preferable. Probably the most interesting feature of the work is that on entering the nave normally, one does not notice that any artificial lighting apparatus exists. From the illustrations, figs. 1 and 2, it will be seen that the pointed Gothic arches of the roof are as well illuminated as the floor; the flutings of the wonderful perpendicular columns are all brought out in detail, and the tracery work of the great west window is accentuated; in fact, many lovers of architecture who have seen the window, state that fresh beauties have been disclosed, which were never visible in daylight. When the work is completed, the steps under "Bell Harry" Tower" and the choir stalls will be lighted, making the vista to the east end complete.

The portions of the building so far dealt with have a floor area of 14,000 sq. ft., including the aisles which cover half this area. The floor of the nave is illuminated on an average to 2.5 foot-candles and the aisles to one foot-candle. With the ceiling and vertical walls, &c., the total area illuminated is about 50,000 sq. ft., with an average illumination of 1.5 foot-candles, equivalent to 75,000 lumens. This represents the utilisation of 85 per cent. of the luminous energy provided by the eleven lamps which, according to the B.E.S.A. specification, should produce 88,000 lumens. The wiring has been carried out by Messrs. H. M. Biggleston and Sons, of Canterbury, who also manufactured the special fittings. The photographs were taken by Messrs. B. & W. Fisk-Moore, also of Canterbury.

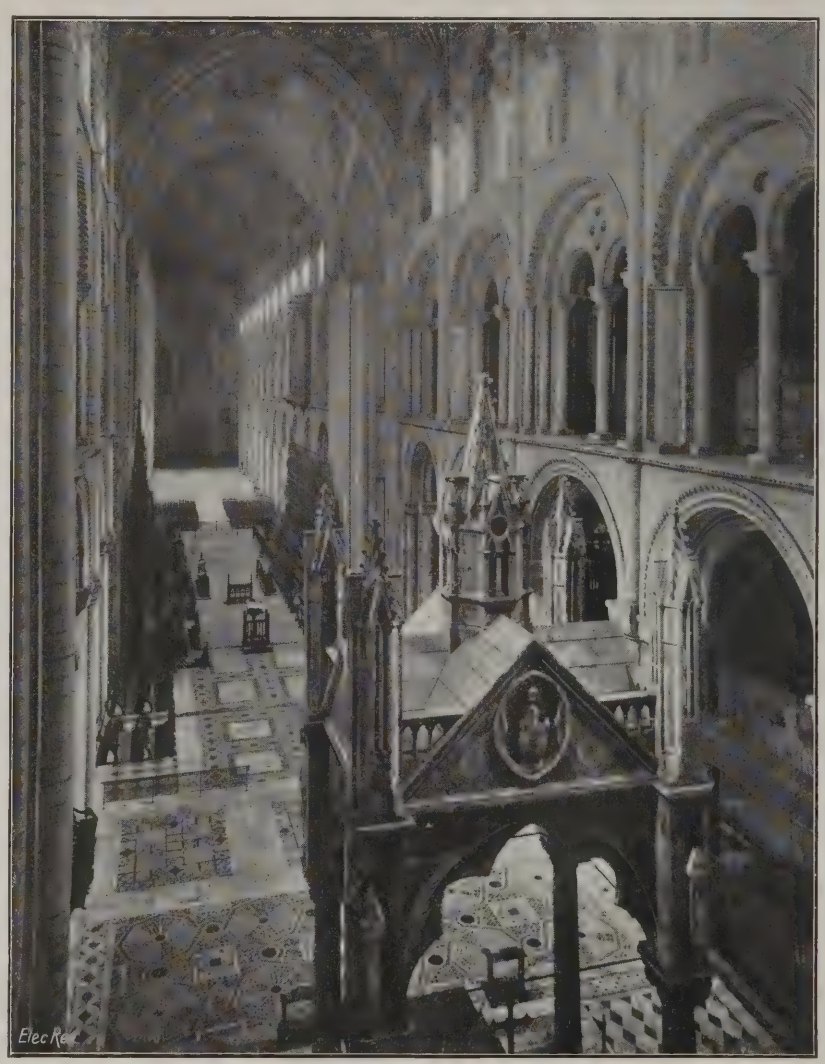

Fig. 3.—Nave and Chancel, Peterborough Cathedral.

Peterborough Cathedral Lighting.

The lighting of Peterborough Cathedral was recently converted from gas to electricity. The building is almost wholly Norman; the chancel, nave, and transepts are arranged in three stages, namely, the arcading, triforium, and clerestory. Most of the lighting is effected by means of fittings placed in the recesses on either side of the clerestory windows, so that the artificial light comes from practically the same direction as the daylight, and the fittings being beyond the normal angle of vision, are practically concealed from view up and down the length of the building. Each lighting unit consists of a specially-designed projector comprising three silvered-glass mirrors mounted in a suitable case, and is equipped with a 250-W projector-type "Mazda" gasfilled lamp. The lamp is supported in a porcelain holder suitably mounted to permit of its being correctly focused in relation to two of the mirrors, the third mirror being itself adjustable. The projector is mounted on an arm with a slide adjustment on a bracket attached to the wall of the building. The bracket is jointed, so that by releasing a screw the complete projector can be swung into a position where it can be easily reached for cleaning, &c., from the walk which runs round the clerestory. The beams from these projectors are trained diagonally downwards across the nave towards the bottom of the piers on the far side. A small lip at the bottom of the reflector deflects a portion of the beam upwards to that part of the walls above the fittings. This scheme was not possible beneath the central lantern tower, where eight special fittings are mounted nearly 100 ft. above the floor. Each of these is provided with a single silvered-glass reflector and a device to prevent any glare effect on the walls in the upper part of the tower. These fittings are supported on tubular arms, which are carried from a pivot attached to the wall of the building, and are provided with a counter-balance weight so that the units themselves, which project some considerable distance beyond the masonry, can not only be swung round to accessible positions for cleaning, but can also be adjusted in all directions from this position.

The lighting of such positions as the eastern end of the apse is effected by "Mirolux" trough reflectors placed in the triforium and the clerestory. The illumination throughout is particularly effective; fig. 3 shows the nave and chancel in the artificial light. An important feature of the installation is the absence of any fittings in the aisles, which depend for their illumination on light reflected from the nave. The result, shown in fig. 5, is a notably soft uniform illumination. Special wall lanterns in keeping with the surroundings are employed for the illumination of the vestries. The entrance in the west porch, fig. 4, is lighted by means of flood-light fittings inserted in the paving. The light from these units is thrown upwards on to the vaulting, whence it is diffused over the entrance way to the west doors. Strip spirals are placed vertically in front of the lamps to prevent them from being seen directly in passing from the porch to the cathedral, or *vice versa*.

The circuits are controlled by contactor switches, which are in turn under push-button control. Two contactor panels are situated on the triforium level, and the corresponding push-button panels are placed

at the back of the choir stalls on the south side. Multicore control cables, specially made by Messrs. Callender's Cable & Construction Co., Ltd., are run from the push-button boards through the crypt to the staircase at the south end of the south transept, up the staircase to the triforium, and to the contactor panels. Each of these cables is equipped with 37 numbered conductors; 16 pairs of push buttons are provided on each control panel. Each contactor panel is provided with 15 contactors, each furnished with a no-volt and an overload release. The panels are contained in well-ventilated sheet-steel cases mounted on concrete.

Fig. 4.—West Porch, Peterborough Cathedral.

The building is wired throughout with the Henley wiring system; the lead-covered cables are placed out of sight of the congregation. Mr. H. A. Nevill, the city electrical engineer, acted as consultant for the work to the Cathedral authorities. The design of the installation and the manufacture of the fittings were undertaken by the British Thomson-Houston Co., Ltd., and the wiring and erecting work by Messrs. Amies & Sons, contractors.

Fig. 5.—Lighting of the Aisles, Peterborough.

York Corporation's "One-Man" Tramcar.

A Real Effort to Reduce Operating Costs.

By J. A. BROMLEY, A.M.I.E.E., M.I.A.E., M.Inst.T.

GIVEN a route approximately three miles in length, with permanent way and overhead equipment almost new, an average income of 14.25d. per revenue mile run and little prospect of any immediate increase in revenue, with operating costs, interest, and sinking fund charges respectively 13.81d. and 3.00d. per mile—the problem to be solved is: how to reduce the deficit? The annual mileage on the route concerned is, with a maximum number of six cars, approximately 200,000 miles. If I could reduce the operating costs by an amount equal to half the platform labour costs (in my case it is 5.173d. per mile), an approximate net loss of £2,000 would be converted into a net profit of about £20 per annum. I decided, therefore, and my Corporation agreed, that under such circumstances the "one-man car" was the solution.

The use of the "one-man car" in this country has, so far, been very limited, and although many tramway managers and engineers have experimented with this type of car, it is only recently that an order has been placed in this country for a "one-man tramcar" as a complete vehicle. In designing the "one-man car," the principal factors which have been kept in mind have been: safety

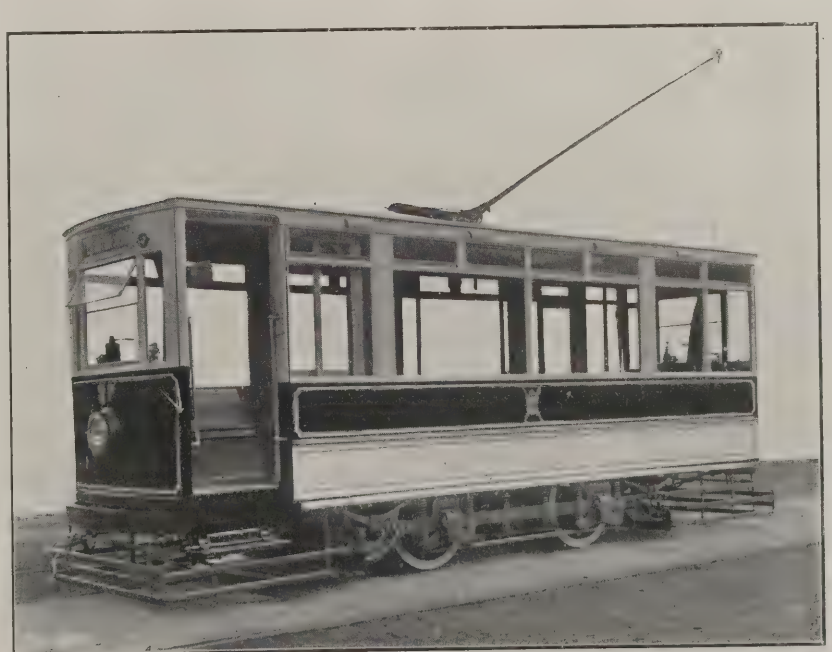

Fig. 1.—"One-man" Tramcar; York Corporation.

for the travelling public and simplicity in operation, as the driver, in collecting the fares and also in driving the car, must have as few complications as possible. It was decided, after consultation with the Ministry of Transport, that the maximum seating capacity for the first car should not exceed 24. From the experience gained by the operation of this car, I say without hesitation that this number can, with perfect safety, be increased to from 28 to 30. The accompanying illustrations show the car to be of the single-deck variety, mounted on a standard Preston 4-wheel truck having a wheel base of 6 ft., the overall length of the car being

Fig. 2.—Interior of Car, showing Driver's Platform.

23 ft. 6 in. The complete vehicle, when empty, weighs approximately 8 tons 7 cwt., the car body alone weighing about 3 tons 5 cwt. The very sound construction of the car is characteristic of the English Electric Co.'s practice.

A feature of the vehicle is the main and platform floors, which are run through at the same level and are made of $\frac{7}{8}$-in. tongued and grooved pine boards—a very good arrangement, as it avoids that step into the saloon which is so very objectionable. Platform vestibules are fitted at each end of the car, and the two doors are operated by levers from the platform; the doors work in conjunction with the folding steps, the door-operating lever on the platform being so arranged that when the door is open it is impossible for the driver to move the controller handle, thus preventing him from starting the car until the door is closed. The doors on both platforms are provided with a locking device consisting of a spring plunger in the floor and operated from the driving end by means of a "Bowden" wire, the control lever being within easy reach of the car controller, so that it is impossible for anyone to open the rear door unless a catch which is under the driver's supervision has been released. The lever operating the "Bowden" wire is fitted with a quadrant arrangement that fixes the lever in either the open or closed position, so that the driver, when moving from one end of the car to the other, can unlatch the door at the driving end (which is under his personal control) while he is on the platform at that end. For an emergency exit when the quadrant lever is released at the driving end, the sliding doors are so balanced that the rear door can be opened by hand without difficulty. When the doors are open, a signal arm projects and indicates to oncoming traffic that passengers are about to alight from the front exit, the arm working in conjunction with the door and step. To avoid any risk of accidents at night time during loading and unloading, when the door opens an automatic switch operates a lamp above the door and throws a light on the step. In addition, an illuminated sign bearing the words "Danger, front exit car" is fitted on each dash. Depending on the way the car is travelling, the rear notice is illuminated, thus giving due warning to oncoming traffic.

With trolley reversers equipped throughout the system, the trolley will not require changing from the time the car leaves the depôt in the morning until it arrives back again at night.

Provision has been made for a smoking compartment at the opposite end to that from which the car is driven. The signal bells are of the "Numa" air-operated type with push buttons at convenient places. The driver is provided with a circular seat, and the lifeguards, of the Hudson and Bowring type, work in conjunction with the side-guards on each side of the platform. A Westinghouse straight air brake is arranged to work in conjunction with the "dead man's" controller, which has a "run-back" preventer and other features, as shown in fig. 3, but its operation is similar to that of the standard drum controller, the only difference being that the power-handle "dead-man's" device automatically operates the air brake and mechanically trips the circuit breaker. To restart the car it is only necessary to bring the controller to the "off" position and reset the circuit breaker, which is within easy reach of the driver. With the controller handle on the rheostatic brake notches, if the "dead-man's" lever is released, the emergency air valve will apply the air brakes, but the circuit breaker will not be tripped. Likewise, with the controller handle in the "off" position and the reverse lever in the "on" position, on releasing the "dead-man's" lever, the emergency air valve applies the brakes, but the circuit breaker is not tripped.

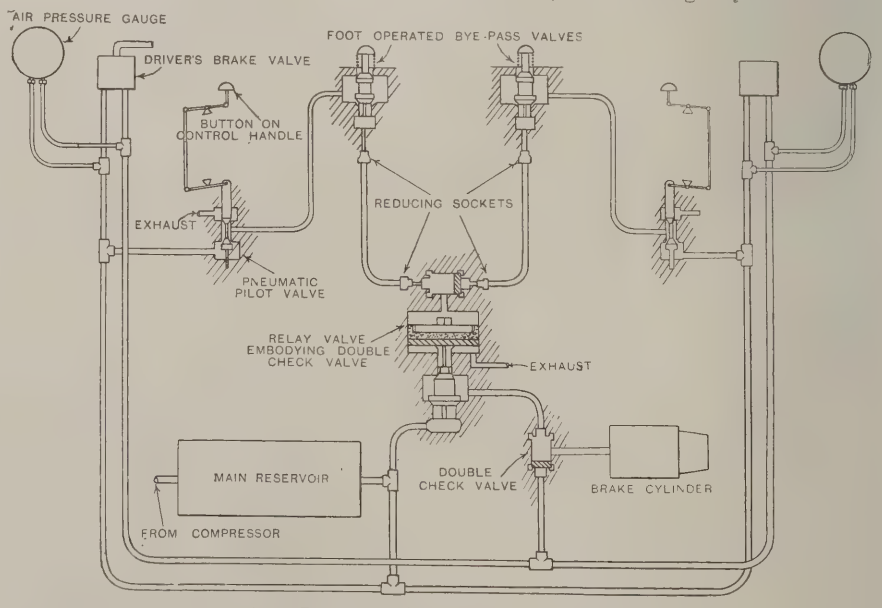

Fig. 3.—"Dead Man's" Pneumatic Control System.

A novel feature of this system is the use of a foot-operated pedal which, when depressed, renders the emergency air brake inoperative. This is used by the driver only when he releases the "dead-man's" handle for the purpose of taking fares, the object being to preserve the air pressure in the reservoirs.

The trucks are fitted with wheels 32 in. in dia-

meter, and two "English Electric" D.K. 29A motors of 30 h.p. at 500 volts on the one-hour rating, and the drive is through single-reduction spur gearing. The motors are self-ventilating, and are easily accommodated on the 3 ft. 6 in. gauge which is standard in York.

The air brake equipment, supplied by the Westinghouse Brake & Saxby Signal Co., Ltd., consists of one 6 cu. ft. air compressor coupled direct to a Metropolitan-Vickers 1¼-b.h.p. protected motor, two reservoirs, and a governor, which can easily be set to operate at any predetermined pressure; from experience I have found maximum and minimum pressures of 65 and 45 lb., respectively, to be the most serviceable.

The Minister of Transport, on whose behalf the car was inspected and tested by Lieut.-Colonel Mount, states that the details of the car have been well thought out, and has requested to be furnished with a report upon its operation under traffic conditions in six months' time.

Telegraph and Telephone Notes.

Australia.—NEW RADIO TELEGRAPH STATION.—The new Commonwealth Government wireless telegraph station at Camooweal, Queensland, which was opened in November last, completes the chain of stations across Northern Australia—Wyndham (W.A.) to Wave Hill (Northern Territory) thence to Camooweal, and then on to Brisbane. As there is no telegraph office at Camooweal, the station will bring a large area into closer touch with civilisation, and if squatters and private persons desire to link up with any of these stations, by either ordinary or wireless telephony, the telegraph department will be prepared to handle their traffic for them.

Belgium.—NEW TELEGRAPH CABLES.—The Belgian Government some time ago decided to install a telegraph cable between La Panne and Herbesthal, and another between Lille and Rosendael, with the object of opening up direct communication between Germany and England, on the one hand, and France and Holland, on the other. *The Times* now reports that the Minister of Railways, Posts and Telegraphs has received tenders for the laying of these long-distance cables from various firms, and has decided to give three-quarters of the work to certain Charleroi concerns, the remaining quarter being assigned to a German firm. It is anticipated that the work, which will cost the State about 70,000,000 fr. (approximately £660,000), will be completed within two years. It is expected that an increased revenue of 10,000,000 fr. a year will accrue to the Belgian telephone and telegraph administration from the new cables, this sum representing the approximate value of the communications which the Belgian administration is at present compelled to refuse owing to the absence of direct cables.

China.—WIRELESS TELEPHONE SERVICE.—The Ministry of Communications is taking steps to install a wireless telephone service between Tientsin and Shanghai.—*Reuter's Trade Service* (Shanghai).

Holland.—POLICE RADIO SERVICE.—A Commission representative of the police force and radio authorities has reported that wireless is useful to the police as an efficient and speedy means of communication, and that its cost, in comparison with the service it could render, is very small.—*Daily Mail.*

Germany.—TELEPHONES ON TRAINS.—Travellers on express trains running between Hamburg and Berlin will, from January 4th onwards, be able to telephone by wireless from the railway trains, and the service will be extended to other trains as soon as possible.—*Reuter* (Berlin).

Madeira.—WIRELESS STATION.—Marconi's Wireless Telegraph Co., Ltd., has recently commenced work upon the erection of a wireless station under its Portuguese concession near Caniçal, Madeira, on a small table-land about 800 ft. above sea level. The building is to be constructed of ferro-concrete and cement blocks, all of which, together with the water, has to be transported up the mountain side, a new road having been made for this purpose. The work is being done by a British firm, the Madeira Supply Co., Ltd., engineers, of Funchal, of which Mr. J. H. Quicke is the chief engineer.

Telephones in the Far East.—THE POLYGLOT PROBLEM.—Automatic telephones, a proportion of which are of British manufacture, are finding favour in the Far East; they appear to be the only satisfactory method of dealing with the large number of different languages (some 26) commonly spoken in the large towns. China possesses the largest automatic exchange of the Far East in that of the Dairen telephone system, which was installed in 1922; it is operated by the South Manchurian Railway Co., and is equipped for 4,800 lines. The Automatic Telephone Manufacturing Co. has recently completed four municipal automatic exchanges in Shanghai, and there is also an automatic exchange at Harbin, which was installed a year before that at Dairen, and is equipped for 3,000 lines. It was the successful operation of this exchange that paved the way for the Dairen project. Work has begun on the installation of an automatic system to serve the Tientsin district. Japan is replacing the Tokio system, which was destroyed by the earthquake and fire, by an automatic system of English make and of the type approved by the British Post Office.

The Telephone Service.—PROGRESS IN MANCHESTER.—The annual report of the Manchester Telegraph and Telephone Advisory Committee, signed by Mr. W. J. Medlyn, superintending engineer, shows that considerable progress has been made in the preliminary work connected with the introduction of automatic telephones in the Manchester district. Subscribers who will be served from the new Ardwick exchange are now using the numbers which will be allotted to them in the automatic exchange; the main building will be in Chapel Street. Complete new exchange equipment has been provided at Didsbury, Higher Broughton, Leigh, Saddleworth, and Delph, and a substantial addition has been made to the equipment at Oldham. New exchanges or equipment are to be provided at Atherton, Bramhall, Knutsford, Openshaw, Stalybridge, and Whaley Bridge. A relief exchange at York Street will provide for development pending the introduction of automatic working, and the new subsidiary automatic exchanges at Ardwick, Moss Side, and Collyhurst will be commenced shortly.

During the last year 8,974 new telephones were fitted, a net increase of 5,677, which constitutes the highest record for 13 years. The number of telephones was 70,958 in September, 1925, a growth of 115 per cent. in 13 years. The number of outstanding applications which could not be accepted owing to shortage of underground cables had been reduced at the end of October to 15. It is now generally practicable to give service on new lines in about 65 per cent. of the cases within one week of the receipt of the order, and 85 per cent. within two weeks. During the past two years the increase in underground cable mileage has been 50,151 miles, or an average of nearly 500 miles of wire per week. In the past 13 years the total has risen from 75,476 to 246,126.

The repeater stations at Fenny Stratford and Derby, on the London-Manchester cable, have given excellent service: that at Manchester, which was originally equipped for 30 repeaters, has been enlarged to 50 and 42 of these have been brought into use. Fifteen additional repeaters are now being installed.

The number of effective trunk calls in the Manchester district during the past year was 5,339,487, an increase of more than three-quarters of a million over 1924. Telegrams received by telephone from the public numbered 403,321, an increase of 61,500, and the local effective calls during the year numbered 46,391,000, an increase of over six million calls. On an average the telephonist answers the calling subscriber in 5.7 seconds. Street kiosks number 119, and a new feature is being introduced in connection with the Stockport automatic exchange in the shape of multi-coin boxes at call offices which provide for trunk calls.

The apparatus at the head post office for handling telegrams by telephone is being replaced by equipment of the latest type, and auto-Baudot apparatus has recently been installed to provide eight channels between Manchester and London. The volume of traffic makes the London-Manchester group the heaviest telegraph channel between any two offices in the world.

United States.—TELEPHONE FACTS.—There are now 10,000 telephone companies in the United States, more than twice as many companies as there are exchanges in the United Kingdom. In addition, there are approximately 30,000 rural telephone lines, operated largely on a co-operative basis, which do not rank as companies.

Radio Notes.

Australia.—NEW STATION.—The new broadcasting station (2KY) is owned by the Labour Council and will apparently be used for Socialist propaganda. According to the *Sydney Morning Herald* the Government was represented by Mr. A. C. Willis, vice-president of the Legislative Council, who, in officially opening the station ("an Australian product, built by Australian engineers") said that the development of wireless in Australia had been hampered by a Nationalist Federal Government, acting in concert with big vested monopolies. The Government's plan for the establishment of a high-power central station, and the erection in provincial and country centres of a series of relay broadcasting stations was now in the final stages of completion.

Canada.—WAVE-LENGTH.—The Department of Marine has authorised a wave-length of 52.51 metres as the "Trans-Canada" wave-length exclusively for long-distance relay work. This is also the authorised wave-length for communication with other parts of the Empire.—*Reuter* (Ottawa).

Latvia.—LICENCES AND TAXES.—H.M. Consul at Riga (Mr. G. Shepherd) has forwarded to the Department of Overseas Trade extracts of the regulations governing the use of broadcast radio receivers. Permits are issued for the installation and use of sets on payment of the subscription for one quar-

ter, the holder being entitled to acquire sets and parts thereof either from the Post and Telegraph Main Administration or from private firms possessing the requisite manufacturing or trading permit of the Administration. Quarterly subscriptions range from three lats in the case of State and municipal institutions, hospitals, &c., and six lats in the case of the ordinary subscriber, up to 90 lats in the case of kinemas, hotels, &c. All articles must be stamped according to the regulations, which came into force in November, 1925, the sealing charges being as follows: Receivers and amplifiers, 10 lats per valve (max. 40 lats for one apparatus); separate tuning apparatus, 10 lats; crystal receiving sets, 2 lats; valves 2 lats each; earphones 1 lat (double 2 lats); and loud-speakers from 5 to 20 lats, according to size (price). The total sealing dues, charged yearly for small appurtenances sold by commercial undertakings, vary from 100 to 500 lats, according to the town or district in which the sale takes place. Wireless apparatus is not specifically mentioned in the Latvian customs tariff, but is probably included in telegraph and telephone apparatus, the rate for which is 0.50 gold franc per kilogm.

Simultaneous Transmission.—ALTERNATIVE PROGRAMME DIFFICULTY.—The B.B.C.'s proposal to provide London with an alternative programme by using the old aerial at Marconi House, Strand, in addition to the 2LO aerial in Oxford Street, has been turned down by the Government's Wireless Telegraphy Board. According to the *Daily Mail* the Postmaster-General had regarded the idea sympathetically, but the Board (a sub-committee of the Imperial Defence Committee) considered that the Air Ministry in Kingsway would be hampered in receiving official communications.

Ships' Radio Apparatus.—SPARK AND CRYSTAL SETS.—At the Liverpool Centre of the Institution of Electrical Engineers, Mr. E. H. Shaughnessy, of the wireless section of the Post Office, recently lectured on "Post Office Wireless Stations." He said that listeners would experience less interference if they used coupled circuits on their sets. One of the advantages of the spark system from the shipping point of view was its broad tuning, though that was a defect from the point of view of the broadcaster. Loose coupling made spark signalling less offensive to the listener, but it could not be carried too far as it reduced the range of the transmitter. There were still something like 3,000 ships fitted with crystal receiving sets, which had a limited range, and until they were replaced with more sensitive and longer-range valve sets the Post Office would be obliged to use spark transmission.

Not long ago Mr. H. Bishop estimated that spark stations represented a capital of £2,000,000.

Contracts Open and Closed.

(The date given in parentheses at the end of the paragraph indicates the issue of the "Electrical Review" in which the "Official Notice" appeared in our advertisement pages.)

Open.

Australia.—MELBOURNE.—March 16th. Postmaster-General's Department. Battery-charging power board equipment.*

Beckenham. — January 14th. Electricity Department. Water-heating and softening plant. (December 18th.)

Belgium.—February 24th. Belgian Post and Telegraph authorities, La Salle Madeleine, Brussels. Supply and installation of telephone switchboard tables with c.b. and luminous signals, for the interurban and regional telephone exchange at Verviers. Particulars (Cahier des Charges Special, No. 3-160) for 8¼ fr.

March 1st. Compagnie Intercommunale des Eaux, Liége (20, Rue des Guillemins). Nine sets of electric motors and centrifugal pumps at three water-pumping stations.

Birmingham.—January 9th. Tramways Committee. 50 tramcar bodies. Forms of tender (£2) from Mr. A. Baker, general manager, Tramways Offices, Birmingham.

Blackpool.—January 23rd. Electricity Department. One 2,500-kVA phase and frequency changer. (See this issue.)

Bulgaria.—Tenders are being invited by the "Watscha" Wassersyndicat, of Kritschim (Plovdiv), for the equipment of a steam-operated central electric power station, consisting of two steam turbines and generators, a motor generator, main and auxiliary transformers, and a battery of accumulators.

Croydon.—January 11th. Tramways Department. 12 sets of electrical equipment for tramcars. (See this issue.)

Dundee.—January 14th. Electricity Department. Two electrically-driven centrifugal drainage pumps controlled by float gear. (December 18th.)

Town Council. Electric lighting installation at day nursery, North George Street. Particulars from Mr. G. Baxter, city engineer.

January 15th. Harbour Trust. Electric lighting installation at New Wharf. Schedules from Mr. J. Hannay Thomson, general manager and engineer.

Eastbourne.—January 9th. Electricity Department. 12 months' supply of h.p. and l.p. paper-insulated cable. (See this issue.)

January 25th. Electricity Department. One 2,500-kW turbo-alternator, with condensing plant and pipework, one water-tube boiler and economiser, feed heaters and piping, one water-cooling tower. (See this issue.)

Edinburgh.—January 4th. Electricity Supply Department. Two 1,200-b.h.p., 6,600-V, 3-ph. induction motors. (December 11th.)

Egypt.—CAIRO.—February 20th. Director-General, Mechanical Department, P.W.M. Power plant for Giza.*

January 20th. Local Commissions Section. Electric motor and accessories at Manfalout waterworks.*

Ilkley.—January 20th. Electricity Department. Feeder cables, distribution cables, feeder pillars, and network boxes. (See this issue.)

London.—CAMBERWELL.—January 11th. Borough Council. Stores, including electric lamps, for 12 months. Particulars from Borough Engineer, Town Hall, Camberwell.

LAMBETH.—January 5th. Board of Guardians. Twelve months' supply of incandescent electric lamps. (December 25th.)

SHOREDITCH.—January 27th. Electricity Department. One 50,000-lb. water-tube boiler, with economiser, forced and induced draught, &c.; one 10,000-kW turbo-alternator, with condenser, pumps, &c. (December 25th.)

BETHNAL GREEN.—January 19th. Board of Guardians. Three Lancashire boilers for the hospital, Cambridge Road. Specifications, &c., from Mr. C. F. Jones, clerk to the Guardians, Bishops Road, Bethnal Green, E.

METROPOLITAN ASYLUMS BOARD.—January 27th. Installation of electric lighting at the Darenth Colony, Dartford (approx. number of points 2,300). (See this issue.)

Manchester. — January 12th. Tramways Committee. Steel girder tramway rails. Mr. H. Mattinson, general manager and chief engineer, 55, Piccadilly, Manchester.

January 6th. Board of Guardians. Electric lighting installation at the pathological and dispensing block, Crumpsall Infirmary. Specifications from Mr. A. J. Murgatroyd, architect, 23, Strutt Street, Manchester.

New Zealand.—WELLINGTON.—March 2nd. Public Works Department. Synchronous condenser and transformers for the Arapuni electric power scheme.*

30,000-V switch and protective apparatus for Lake Coleridge electric power supply.*

DUNEDIN.—February 26th. Otago Harbour Board. Motors, control gear, and cable.*

Rumania. — January 26th. Municipal authorities of Temesvar. 14 transformers and a quantity of lead-covered cables for the central electric lighting station in that city.

South Africa.—JOHANNESBURG.—January 21st. Municipal Council. 106 current transformers.*

February 26th. Motor-driven air compressor, with electrical equipment.*

S.A. Railways and Harbours. February 25th. Electrically-operated hoists for raising, &c., heavy locomotives, electrically-driven geared winches, &c.*

CAPE TOWN.—January 27th. Electricity Department. Oil-cooled transformers.*

Sweden.—The Swedish Water Power Utilisation Department, Stockholm, has invited tenders for the supply and installation of a 12,500-kVA outdoor transformer plant, and an indoor plant of a capacity of 10,000 kVA for the Aelvkarleby and Norrviken hydro-electric stations.

Thurnscoe.—January 12th. West Riding Education Committee. Electric lighting installation at new school. Specifications from Education Department, County Hall, Wakefield.

*Further particulars can be obtained at the Department of Overseas Trade (Inquiry Room), 35, Old Queen Street, S.W.1.

Closed.

Barking Town.—Electricity Committee. Accepted:—
2,000 yd. e.h.p. 3-core cable (£851).—Hackbridge Cable Co., Ltd.
Steelwork for transformer house in Axe Street (£932).—Sanders and Forster, Ltd.

Bradford.—Tramways Committee. Accepted:—
Railless trolley cars.—Associated Equipment Co. and R. Garrett and Sons.

Croydon.—Electricity Committee. Recommended:—
Boiler feed pump (£341).—Mather & Platt, Ltd.

Glasgow.—Corporation. Accepted:—
Electric hot plate, for the Greendyke Street Home (£82).—Carron Company.
Wiring and switchgear (£55).—Corporation Electricity Department.

Tramways Committee. Accepted:—
Forged mild steel axles.—Glasgow Railway Engineering Co., Ltd.
Armature and field coils.—P. R. Jackson & Co., Ltd.
Steel pinions.—British Hele-Shaw Patent Clutch Co., Ltd.; Cammell, Laird & Co., Ltd.; W. C. Yuille & Co., Ltd.

Government Contracts.—The following Government contracts were placed during November, 1925 :—

ADMIRALTY CONTRACT AND PURCHASE DEPARTMENT.

Dry batteries.—Edison Swan Electric Co., Ltd.
Condensers.—W. H. Wilson.
Electric annealing furnace.—Electric Furnace Co.
Motor alternators.—Crompton & Co., Ltd.
Motor generators.—Small Electric Motors, Ltd.
Starters, &c.—Watford Electric Mfg. Co., Ltd.
Repair of starters.—Marconi Co., Ltd.
Switchboards.—Whipp & Bourne, Ltd.
Switches.—Hawkers, Ltd.; Player & Mitchell; W. McGeoch & Co., Ltd.; Gabriel & Co.; Park Royal Engineering Co., Ltd.
Change-over switches.—General Electric Co., Ltd.; Park Royal Engineering Co., Ltd.
Fuse release switches.—Whipp & Bourne, Ltd.; Bertram Thomas.
W/t. switches.—General Electric Co., Ltd.; Whipp & Bourne, Ltd.
Switchgear (branch breakers).—Whipp & Bourne, Ltd.
K's new patent forced feed-oil cans.—J. Kaye & Sons, Ltd.

WAR OFFICE.

Battery, &c.—Chloride Electrical Storage Co., Ltd.
Electric light fittings, &c.—General Electric Co., Ltd.

AIR MINISTRY.

Voltage control boxes.—Pyne Mfg. Co., Ltd.
Underground cables (Altrincham).—G. E. Taylor & Co.
Ignition accessories.—Robinhood Engineering Co., Ltd.
Repair of receivers.—Muirhead & Co.

POST OFFICE.

Telephone apparatus.—British L. M. Ericsson Mfg. Co., Ltd.; International Electric Co., Ltd.; Peel-Conner Telephone Works, Ltd.; Phœnix Telephone & Electric Works, Ltd.; Standard Telephones and Cables, Ltd.; Sterling Telephone & Electric Co., Ltd.; Telephone Mfg. Co., Ltd.
Testing, measuring, and protective apparatus.—British Thomson-Houston Co., Ltd.; Chamberlain & Hookham, Ltd.; Edison Swan Electric Co., Ltd.; Phœnix Telephone & Electric Works, Ltd.; Walters Electrical Mfg. Co., Ltd.
Wireless apparatus.—Telegraph Condenser Co., Ltd.; Zenith Mfg. Co.
Cables.—British Insulated & Helsby Cables, Ltd.; Connollys (Blackley), Ltd.; Enfield Cable Works, Ltd.; W. T. Glover & Co., Ltd.; W. T. Henley's Telegraph Works Co., Ltd.; Johnson & Phillips, Ltd.; Pirelli-General Cable Works, Ltd.; Receivers of H. W. Smith (1920), Ltd.; Standard Telephones & Cables, Ltd.; Union Cable Co., Ltd.
Conduit and fittings.—Eureka Conduit & Fittings Co.; Longmore Bros.
Telephone cords.—British Insulated & Helsby Cables, Ltd.; London Electric Wire Co. & Smiths, Ltd.; Phœnix Telephone & Electric Works, Ltd.; Siemens Bros. & Co., Ltd.; Standard Telephones and Cables, Ltd.
Ducts.—H. R. Mansfield, Ltd.
Lamps.—Cable Accessories Co., Ltd.; A. C. Cossor, Ltd.; Edison Swan Electric Co., Ltd.; General Electric Co., Ltd.
Battery plates.—Alton Battery Co., Ltd.
Cable distribution plugs.—Siemens Bros. & Co., Ltd.
Battery-charging sets.—Stuart Turner, Ltd.
Lead sleeves.—British Insulated & Helsby Cables, Ltd.
Electric trucks.—W. Goodyear & Sons.
Copper binding wire.—Enfield Cable Works, Ltd.; Pirelli-General Cable Works, Ltd.
H.d. copper wire.—Nevill Druce & Co., Ltd.
Tinned copper wire.—Pirelli-General Cable Works, Ltd.
Manufacture, supply, drawing-in and jointing cable.—Swansea-Ammanford : W. T. Glover & Co., Ltd. Walsall-Lichfield : British Insulated and Helsby Cables, Ltd. Marks Tey-Ipswich : Johnson & Phillips, Ltd.
E.h.p. transformers (G.P.O. (South) sub-station).—Siemens Bros. & Co., Ltd.
E.h.p. and l.p. switchgear (G.P.O. (South) sub-station).—A. Reyrolle and Co., Ltd.
Electric lighting, Leicester Telephone Exchange.—T. H. Wathes & Co., Ltd.
Private branch exchange telephone equipment.—Carpet Trades, Ltd. (Kidderminster); Lancashire County Council offices (Preston); Watney, Combe & Reid, Ltd. (Mortlake, S.W.); the British Mannesmann Tube Co., Ltd. (Newport, Mon.) : Relay Automatic Telephone Co., Ltd. Pearson, Dorman, Long & Co., Ltd. (Betteshanger Colliery, Kent) : Standard Telephones & Cables, Ltd.
Telephone exchange equipment.—Sherwood (Nottingham), Arkwright Street (Nottingham) : Automatic Telephone Mfg. Co., Ltd.; sub-contractors : Tudor Accumulator Co., Ltd., for batteries; Crompton and Co., Ltd., for charging machines. Basford (Nottingham) : Automatic Telephone Mfg. Co., Ltd.; sub-contractors : Tudor Accumulator Co., Ltd., for batteries; Crompton & Co., for charging machines; Newton Bros. (Derby) for ringing machines. Buckhurst : Automatic Telephone Mfg. Co., Ltd. Seven Kings : Siemens Bros. and Co., Ltd.; sub-contractors : Chloride Electrical Storage Co., Ltd., for batteries; Crompton & Co. for ringing machines. Dumfries : Siemens Bros. & Co., Ltd.

H.M. OFFICE OF WORKS.

Wiring, &c. (Charity Commissioners' office, Ryder Street, W.).—Electrical Installations, Ltd.

CROWN AGENTS FOR THE COLONIES.

Battery material.—Siemens Bros. & Co., Ltd.
Copper cable.—T. Bolton & Sons, Ltd.
Ceiling fans.—General Electric Co., Ltd.
Electric headlights and spares.—C. Stewart & Co., Ltd.
Porcelain insulators.—Doulton & Co., Ltd.
Lightning arresters.—International General Electric Co., Ltd.
Transmission line material.—Callender's Cable & Construction Co., Ltd.
Telegraph poles.—Bullers, Ltd.
H.d. copper wire, &c.—F. Smith & Co.; Elliotts Metal Co., Ltd.
Wood separators.—Chloride Electrical Storage Co., Ltd.

Hornsey.—Electricity Committee.

Meters and time switches.—Chamberlain & Hookham, Ltd.; Ferranti, Ltd.; Reason Mfg. Co., Ltd.; and Venner Time Switches, Ltd. (Recommended.)
Disconnecting boxes (£23 per box).—Motor Gear & Engineering Co., Ltd. (Accepted.)

Hull.—Electricity Committee. Accepted:—

Cooling towers (£5,539).—Davenport Engineering Co., Ltd.

Kilmarnock.—

Electrical equipment of new premises, for D. Lander & Sons.—W. Dow and Sons, Ltd.

Lamp Contracts.—Siemens & English Electric Lamp Co., Ltd., has received contracts for 12 months' supplies of train-lighting lamps from the London & North-Eastern Railway Co.; for traction lamps from the Dublin United Tramways; and for vacuum gasfilled and carbon-filament lamps from Geo. Thompson & Co. (Aberdeen Line). The Great Western Railway Co. has placed a 12 months' contract for "Osram" gasfilled lamps with the General Electric Co., Ltd.

Lichfield.—Town Council. Accepted:—

Transformers and switchgear (£2,790).—Ferguson, Pailin, Ltd.
Cables and road work (£20,488); public lighting cables (£2,579); barracks line (£2,350).—W. T. Henley's Telegraph Works Co., Ltd.

Southampton.—Harbour Board.—In connection with the new sub-station to be erected on the Town Quay, 24 tenders were received for the electrical equipment, only one of which was for the complete specification. The following tenders were recommended for acceptance by the Works Committee :—

Carrick & Sons, Edinburgh, for sections 2, 3 and 4, subject to the fitting of controllers and panels made by Allen, West & Co., at a total cost of £8,050.
George Ellison, section 5, for £749.

The Board, which at the last meeting accepted a contract of £1,000 for the construction of the sub-station, adopted the report, and will take its supply of electricity from the Corporation Electricity Department.

South Africa.—CAPE TOWN.—Recommended :—

43 tons bare copper wire (£3,534).—Davis & Soper, Ltd.
40 tons ditto (£3,505).—Telegraph Mfg. Co., Ltd.

Tynemouth.—Electricity Committee. Accepted:—

Cable (£327).—Macintosh Cable Co., Ltd.

Wakefield.—Rural District Council. Accepted:—

Installation of pumps, electric motors, &c., in connection with drainage scheme of Shay Lane, Walton, near Wakefield.—Pulsometer Engineering Co.

Windsor.—Town Council. Accepted:—

Electric wiring at the Town Hall (£113).—Bridger & Son.

Yarmouth.—Electricity Committee. Accepted:—

Switchgear (£2,750).—English Electric Co., Ltd.
Two water-tube boilers (£25,570).—Babcock & Wilcox, Ltd.

Forthcoming Events.

Junior Institution of Engineers.—Friday, January 1st. At 39, Victoria Street, S.W. At 7.30 p.m. Kinematograph Lecture, "The Manufacture of Ordnance" and "The Rolling Mills and Crucible Melting Department at the River Don Works of Vickers, Ltd.
Friday January 8th. Paper on "Some Notes on Salesmanship," by Mr. A. J. Simpson.

Electrical Power Engineers' Association.—Friday, January 1st. At the Institution of Electrical Engineers, Victoria Embankment, W.C. At 7 p.m. Lecture on "Automatic Boiler Control," by Mr. H. W. Holland.

Nottingham Society of Engineers.—Monday, January 4th. At the Victoria Station Hotel. At 7.30 p.m. Lecture on "Patents for Inventions," by Mr. E. Potter.

Royal Institution of Great Britain.—January 5th, 7th, and 9th. At 21, Albemarle Street, W. At 3 p.m. Lectures on "Old Trades and New Knowledge," by Sir William Bragg

National Association of Supervising Electricians.—Tuesday, January 5th. At the Junior Institution of Engineers, 39, Victoria Street, S.W. At 7.15 p.m. Paper on "The Ultimate Position of the Single-phase Motor," by Mr. W. A. Benger.

Roentgen Society.—Tuesday, January 5th. At 32, Welbeck Street, W. At 8.15 p.m. Papers on "A Combined X-ray Tube and Vacuum Pump Unit" and "The Industrial Uses of X-rays—the Present Position," by Mr. G. W. C. Kaye; and on "The Measurement of Radium During Radio-active Growth," by Mr. A. F. Dutton.

Institution of Heating and Ventilating Engineers.—Wednesday, January 6th. At Caxton Hall, Westminster, S.W. At 7 p.m. Paper on "Pump Circulation," by Mr. J. R. Preston.

Electrical Society of Glasgow.—Wednesday, January 6th. Paper on "Wiring Rules and Defects," by Mr. H. M. Stronach.

Institution of Electrical Engineers.—Thursday, January 7th. At the Institution, Victoria Embankment, W.C. At 6 p.m. Paper on "The Past, Present and Future Development of Wireless Telephony," by Capt. P. P. Eckersley.

(North-Western Centre).—Tuesday, January 5th. At the Engineers' Club, Manchester. At 7 p.m. Lecture on "Co-operative Business Building for the Electrical Industry," by Mr. J. W. Beauchamp.

(Wireless Section).—Wednesday, January 6th. At the Institution, Victoria Embankment, W.C. At 6 p.m. Paper on "Frequency Variations in Thermionic Generators," by Lt.-Col. K. E. Edgeworth.

Edinburgh Electrical Society.—Friday, January 8th. At the Royal Society of Art, 117, George Street. At 8 p.m. Social evening.

Society of Technical Engineers.—Friday, January 8th. At the Queen's Hotel, Birmingham. At 7.30 p.m. Paper on "The Research Factor in Cable Making," by Capt. P. Dunsheath.

Association of Mining Electrical Engineers (Western District Sub-Branch).—Saturday, January 9th. At 62, Wind Street, Swansea. Paper on "Electrical Costing Applied to Collieries," by Mr. C. E. Yates

The "Electrical Review" Service Department.

INQUIRIES must be accompanied by a stamped addressed envelope.

We should be glad to learn the names and addresses of makers of the following :—

Tinned paper suitable for the manufacture of condensers.

BELLTONE (for cleaning accumulator plates).

We also have an inquiry for the present address of Marsdens (Live Publicity), Ltd., late of Bolton, and manufacturers or proprietors of Humannekin Turntables.

Notes.

Big Radio Law Suit in the United States.—Under the title "Sixty-Million-Dollar Radio Suit Filed by Fessenden," the *Electrical World* of December 19th states:—"Suit declaring triple damages amounting to $60,000,000 was filed December 3rd in the United States District Court at Boston on behalf of Prof. Reginald A. Fessenden, of Chestnut Hill, Mass., against the General Electric Co., Radio Corporation of America, Westinghouse Electric & Manufacturing Co., Western Electric Co., Inc., United Fruit Co., Wireless Specialty Apparatus Co., and International Radio Telegraph Co., under the Sherman Act and Clayton anti-trust law. The defendants are charged with lessening and finally destroying competition, restraining commerce and injuring the plaintiff through combination and control of radio apparatus manufacture and use. A list of between two hundred and three hundred inventions, title to which, it is contended, resides in the plaintiff, is appended to the bill."

Swiss Railway Electrification.—The Federal Railways of Switzerland, we learn, have nearly completed the electrification of the section between Geneva and Lausanne. This section has offered no technical difficulties beyond the raising of a foot-bridge near Allaman station, but the electrification work has been difficult owing to the traffic beyond and between the two cities, especially at Geneva, and the running of special trains. It is much to the credit of the electrical engineers that they have finished their work two months in advance of the scheduled time. Trial trips are being run by means of a testing-carriage (wagon d'essai) for the contact points and an overhead trolley for the wires, both drawn by an ordinary steam engine. Cable boxes have been established a kilometre apart along the line, and telephones have simplified matters where there have been breakdowns and unexpected traffic to cope with. It is estimated that electric traction will supersede ordinary locomotion for all trains on the section after January 5th, 1926.

R.A.F. Wireless School.—The Electrical and Wireless School near Winchester at Flower Down has now sent three entries of apprentices to the Central Trade Testing Board, and in no case has a lad failed. This is a "record" held by no other R.A.F. training centre. Sir Philip Sassoon, Under-Secretary of State for Air, recently inspected the school, some 1,100 strong, and the workshops, where 290 lads, 556 men, enlisted by direct entry, and 14 officers on a signals course, are being trained in the theory and practice of wireless. *The Times* explains that a wireless operator-mechanic of the highest grade must be a fitter, have a thorough knowledge of all electrical plant used by the R.A.F. and of the generators used in aircraft, be able to wire aircraft for wireless, operate and repair the instruments, and, in addition, be able to send and receive Morse clear or in code. The minimum standard required is reception for five minutes at 20 words a minute with not more than three errors, and to simulate actual working conditions in the air all practice is carried out with a definite amount of interference cutting the received signals. Actually 60 per cent. of the lads fulfilled the conditions, receiving at 25 words per minute. No other trade in the ranks has so many opportunities, and there are always at each entry examination more applications than the establishment at the moment calls for. Each lad receives three years' training.

The Arrangement of Cells in Series and Parallel.—Mr. W. F. Dunton, of Newcastle-on-Tyne, who nearly 20 years ago pointed out that the generally accepted rule for finding the best arrangement of cells in series and parallel, to give the largest current through a specified external resistance, under certain circumstances might be very misleading, observes that the rule referred to has recently been republished, and he agai takes up the cudgels on behalf of his own formula. He says:—

"The problem is to find what arrangement of n cells, in p parallel rows of s cells in series, will send the greatest current through an external resistance of R ohms, when each cell has a resistance of r ohms and an e.m.f. of e volts, n being any given number. Whatever value we give to s, the current will be $cs/(R + rs/p)$, $= (esp/r)/(pR/r + s)$; and, since esp/r is a constant (sp being the given number of cells), the current will be greatest when $pR/r + s$ is smallest. But this must be when $pR/r - s$ is numerically smallest; for the squares of these last two expressions differ by $4spR/r = 4nR/r$, and when two variables have a constant difference they must reach their lowest values simultaneously. We are thus led to the convenient and infallible rule that the greatest current will be obtained when s is as near as possible to pR/r."

The old rule says that sr/p (which is the resistance of the battery) must be as nearly as possible equal to R; it may seem that this is simply Mr. Dunton's rule expressed in another way, but the difference becomes clear when the rule is applied to actual cases. He also points out that the greatest current obtainable with a given number of cells may be less than that obtainable with a smaller number—it being understood that the cells are in each case arranged in a battery of the above-mentioned regular form, p parallel rows of s cells in series.

Mr. Dunton remarks that this question of battery arrangement is a comparatively unimportant special case of an important class of functions having the form of $ax/(b + cx^2)$. Such functions occur very frequently in engineering investigations; and he remembers a case in which a serious mistake was made in connection with lightning arresters, through the investigator not being aware that this expression had its greatest value when x was as near as possible equal to b/cx. The fact that this is where the greatest value occurs (with a, b and c constant and everything positive) can be proved in the same way as he proves his battery rule, if the numerator and denominator are first divided by cx.

A Severe Ordeal for a Storage Battery.—In connection with the recent failure of the dam at the Aluminium Company's power station at Dolgarrog, North Wales, we learn that at the time of the flood the Chloride storage battery was submerged in ten feet of water, and stood for over four weeks embedded in mud to a depth of over 6 in. above the tops of the cells. We are informed that although it has not been touched since that period it is still working satisfactorily, and is being charged and discharged in accordance with its normal routine. A certain amount of sand has fallen in through the vent holes of the cells, but this has not affected their working. Such a result is, we should think, without a precedent, and affords a striking instance of Chloride reliability.

Röntgen Apparatus in Sweden.—According to a German report from Stockholm, medical circles in Sweden have complained for a long time past that certain accessories for Röntgen apparatus, particularly tubes, are not obtainable in Europe in the same improved form as in the United States. The production of Röntgen apparatus in Europe is limited to a few firms owing to the existence of an international syndicate agreement, and in particular to the A.E.G. and the Siemens Company, while the sole right of manufacture in the United States is vested in the General Electric Company. The report states that, according to Swedish opinion, the accessories turned out by the American company are better than those supplied by the German firms. But in consequence of the existence of the syndicate agreement it is impossible for the Swedes to import the accessories from the United States, although there is a large demand for them in Sweden. In these circumstances Swedish medical men have presented a petition to the Government asking for the State to expropriate the patents concerned on the basis of Article 17 of the Swedish patent ordinance. The Swedish Board of Trade is said to have supported the proposal.

Venner Stop Watch Test.—We have received a copy of a report by the National Physical Laboratory on the Venner stop watch, a production of Venner Time Switches, Ltd. The instrument was examined in the "pendant up" position with the following results to the nearest 0.02 of a second. After indicated intervals of five and 10 seconds the errors were 0.04 second gain in each case; 20 sec., 0.02 gain; 30, O.K.; 50, 0.02 gain; 100, 0.02 gain; 200, 0.02 gain; and 300, 0.04 gain. The watch was found to run satisfactorily for one hour. A description of this instrument appeared in our columns on April 21st, 1922. It may be recalled that the seconds hand records 10 seconds in one revolution, and that each second division is divided into tenths, the latter measuring about 1/16th in. The minute dial records five minutes in one revolution, and each minute division is divided into sixths, so that each small division represents a complete revolution of the seconds hand.

Whitworth Society.—The third annual commemoration dinner was held at the Holborn Restaurant on Monday, December 21st, the anniversary of the birth of Sir Joseph Whitworth, Bart., with the president, Mr. Wm. Sisson, of Gloucester, in the chair, and about 70 members present. There are now 470 members on the roll. Full information can be obtained from the hon. secretary, c/o Institution of Mechanical Engineers.

Appointments Vacant.—Head of the Electrical Engineering Department, L.C.C. Hackney Institute (£480); lady demonstrator and saleswoman (£182) for the Southport Corporation Electricity Department; electrical engineer for the Cornwall Mental Hospital; electrical engineer and electrical inspector for the Public Works Department of the Government of Bihar and Orissa; assistant electrical engineer for the Singapore Harbour Board ($400 a month, dollar=2s. 4d.). (See our advertisement pages to-day.)

Local Societies.—SHEFFIELD ILLUMINATION SOCIETY.—We have received a copy of the syllabus of this Society for the session of 1926, which shows that an interesting series of lectures and visits has been arranged. The Society has now completed its first year, and excellent progress has been made, the membership being 111.

INTERMITTENT ELECTRIC FORCE.—At a meeting of the Royal Society of Edinburgh recently, an address on "The Intermittence of Electric Force, and its effects on Atomic Dynamics" was given by Sir J. J. Thomson. The theory discussed was that when a body is under the action of electric force, instead of receiving a continuous flow of indefinitely small increments of momentum, the increments it receives are each finite in amount and separated by finite intervals of time, called the time interval of the electric field. For events which last over a large number of time intervals the results are the same as those given by the classical theory of continuous force, but for events which can happen in a very short time comparable with the time interval of the field, an entirely different treatment is required, and the path of an electron in an electric field would not be of continuous curvature, but an irregular polygon with a very large number of sides. The electron staggers about irregularly, not necessarily retracing any previous path, but diverging in a way governed by the laws of probability.

When the number of sides of the polygon is very great the number of paths which differ appreciably from that given by the classical theory is a very small fraction of the whole number, but this is not true when the polygon has only a moderate number of sides. It was shown that the intermittence of electric force would lead to some spontaneous dissociation of a system consisting of electrons and positively charged particles, and that it would also lead to the production of Röntgen rays, when electrons passed near atoms, but that these rays would be very soft unless the electrons moved so quickly that the time they were in the neighbourhood of the atom was comparable with the time interval of the electric field in the atom. Since the time interval gets longer as the strength of the electric field diminishes, the waves will be reflected back at this stage, and thus the energy will be confined to a limited volume. The shorter the period of the waves the smaller will be this volume. This has an important application to light, as it shows that the energy must travel in bundles which do not spread out as they travel through space. This conception simplifies the dual theory of light recently brought forward by the author, as it ensures that the energy of the electrical waves in the unit of light shall be constant as well as the energy of the quantum.

ROLLING MILLS.—Mr. L. Rothera, of the English Electric Co., recently read a paper on "Speed Control in Relation to Modern Rolling Mill Drives" to the members of the West of Scotland Iron and Steel Institute in Glasgow. In the case of a sheet mill, Mr. Rothera showed that an increased rolling speed would increase the power cost and at the same time the output would be no greater. In a section mill, however, higher speed would result in a reduced cost and a greater tonnage output. The use of a higher rolling speed would not, within limits, increase the cost of either mill or drive, but more expensive handling apparatus would be necessary, and this would require to be set off against the larger output.

A Children's Party.—Over one hundred children of employés of the Glasgow Corporation Electricity Department who fell in the war were entertained by the Welfare Department to a Christmas treat last week. Bailie Councillor Dewar, Convener of the Electricity Committee, presented each child with a new shilling. Mr. R. B. Mitchell, general manager, and Mrs. Mitchell were present during the evening, the success of which was largely due to the excellent arrangements made by the committee, with Mr. A. M. Estcourt as secretary.

Large Variable-Voltage Transformers.—Six variable-voltage, single-phase transformers were delivered recently to the Philadelphia Electric Company by the Westinghouse Electric and Manufacturing Company; they are rated at 20,000 kVA each, and are oil-immersed, constituting two banks delivering 60,000 kVA to lines supplying power to Trenton and Bristol, N.J. The transformers will operate delta-connected on the low-voltage side at 13,800 volts, delivering power on star connection at from 69,000 to 76,000 volts. The variable delivery is made possible by four steps embodied in a tap-changing device designed for changing voltage under full load without shutting off the power or interfering with the transmission system or circuit-breakers. It is claimed that these are the largest transformer installations ever placed in operation which include tap-changing under load conditions. The specially designed tap-changing mechanism is mounted in a large steel cubicle attached to the top of the transformer tank at one side. The cubicle is off the ground, and is entered through a door which is locked to prevent the tap settings from being meddled with by others than those in charge. The transformer tanks are more than 15 ft. in height, with an overall clearance, including platform and bushings, of 24 ft. The tanks measure 9 ft. 5 in. in diameter. The two banks are being installed in the Richmond Station of the Philadelphia Electric Company as part of what will ultimately be eight 50,000-kVA generating and transmission units.

Arc Welding a Bridge.—The strengthening and repair of Holt Fleet Bridge spanning the River Severn at Holt, Worcestershire, by means of a special process of electric arc welding is being considered by the County Council as an alternative to rebuilding the bridge. Two French engineers, M. de Boulogne and M. Gueritte, have undertaken to inspect the bridge and to report to the Council on the practicability of applying the process. The Surveyor (Mr. F. C. Gettings) has interviewed the chief engineer for steel structures to the Paris, Lyons and Mediterranean Railway, and inspected work on bridges along that railway.

Research Contribution.—Stepney Borough Council Electricity Committee has recommended the Council to make an annual contribution of £25 to the funds of the British Electrical and Allied Research Association.

A New Electric Vehicle.—The City of Birmingham's Cleansing Department has added to its extensive fleet of battery-driven electric vehicles an unusual type which embodies a new idea in the design of such vehicles. It is a 5-ton tipping wagon, supplied by Messrs. Electromobile, Ltd., and its outstanding feature is the fact that it incorporates the four-wheel drive, each wheel being provided with a 2¾-h.p. driving motor. The transmission is through high-ratio compound gearing, the final drive being by means of teeth on a brake drum that forms part of each wheel. Braking is thus provided on each wheel, in addition to the usual form of electric braking operated by the controller. The vehicle marks a new stage in electric refuse-collecting vehicle design and its operation in Birmingham will be watched with interest.

Reduction of L.C.C. Tramway Rates.—According to the *Daily Sketch* a conference of London rating authorities has reduced the rates on the tramway track of the L.C.C. by one half. The L.C.C. claimed that, in view of the heavy losses on the tramways, there should be no rates at all. For the year ended March 31st last the deficiency on the L.C.C. tramways was £286,670. The local rates paid on the tracks amount to over £60,000 a year. It is estimated that the deficiency for 1925-26 will amount to approximately £200,000.

Transmission at 150,000 V.—*Eclairage et Force Motrice* reports that during 1925 the transmission pressure upon the new lines of the Cie. des Chemins de Fer du Midi was progressively carried from 60,000 to 150,000 V. These lines connect the railway company's sub-stations on the Dax-Toulouse line with the source of supply. It was intended to provisionally employ a pressure of 60,000 V, and eventually one of 120,000 V, but it was found that the system, parts of which are designed to carry 100,000 kW, was capable of withstanding 150,000 V. The outdoor transformer stations were supplied by the Cie. Electro-Mécanique. It is suggested that this is the first instance of the use of 150,000-V a.c. transmission in Europe, and it is stated that during tests a pressure of 165,000 V was applied, without any ill-effects, for half an hour.

Institution Notes.

Physical Society of London.—THE DUDDELL MEDAL.—The Duddell Medal of the Physical Society of London has this year been awarded to Mr. Albert Campbell, formerly of the National Physical Laboratory. The medal is awarded to those who have advanced the science of physical measurements by inventing instruments or parts of instruments of novel design. Mr. Campbell has won distinction for many new devices connected with the measurement of capacity and inductance. He was one of the first to introduce coils of small self-capacity, now so largely used in wireless; Campbell's system consists of a number of pancake coils separated from one another by small spaces and held rigidly together.

Mr. Campbell has invented instruments for the measurement of frequency; others, known as wave sifters, for the elimination of particular frequencies; instruments, called microphone hummers, for the production of small alternating currents; and vibration galvanometers for use in measurements employing alternating current. The instrument which has won him greatest fame is the standard mutual inductance, which forms the basis of most of the accurate measurements of inductance in this country. Mr. Campbell is well known for his skill as an experimenter, and has made two determinations of the ohm in absolute units.

Institution of Public Lighting Engineers.—At an emergency Council meeting, held at Leeds, at the termination of the second annual meeting and conference, votes of thanks were accorded to Mr. S. B. H. Langlands, J.P., the retiring president, and Mr. W. J. Liberty, the hon. secretary, and the latter was presented with a cheque on behalf of the Council. Mr. Leon Gaster, hon. secretary of the Illuminating Engineering Society, was admitted as an hon. member of the Institution, and it was confirmed that the third annual meeting and conference should be held in September, 1926, at Newcastle-upon-Tyne, under the presidency of Mr. R. Davison, superintendent of the public lighting of that city.

Institution of Heating and Ventilating Engineers.—PRIZE COMPETITION.—The Council of the Institution is offering prizes for original papers as follows: The Lumby Premium (10 guineas) for the best paper dealing with, or any subject connected with, heating or hot-water supplies; the Sirocco Premium (10 guineas) for the best paper on ventilation and the general application of fans, air washing and conditioning, dust and fume removal, mechanical draught, &c.; and the London Premium (five guineas) for the next best paper on any subject included in the above. The competitor must be either a student attending a technical institute or an assistant actively connected with the business of heating and ventilating in Great Britain and Ireland, and is not a principal or an employer. Papers should be not more than 7,000 words in length, and must be written under a *nom-de-plume*, the name and address of the author, in a separate sealed envelope, to be sent with the paper to the secretary not later than May 1st, 1926.

An Institution of Fuel Economy.—A new Institution has been formed, to deal in a scientific manner with the problem of preparing and utilising our fuel resources with much greater efficiency. This new organisation, which is called "The Institution of Fuel Economy Engineers," was inaugurated at a meeting of experts on Tuesday last week, at the Engineers' Club, London. Among those taking part in the proceedings were Dr. T. Barratt, Prof. Bacon, Mr. W. C. Goodchild (representing Sir Henry Fowler), Dr. R. Lessing, Messrs. E. W. L. Nicol, John Bruce, S.W. Bettoney, J. S. Gander, and A. C. Mahar. The first Council was elected, and it was decided to form sections in different parts of the country. It is hoped to make this new Institution the responsible organisation representing every section of fuel technology throughout the country. The secretary is Mr. H. L. Pirie, and the registered office of the Institution is 29, Sherwin Road, Lenton, Nottingham, pending the opening of London headquarters.

Our Personal Column.

(Electrical men are invited to enable us to keep readers of the "Electrical Review" posted concerning their movements).

The Canadian *Electrical News* announces that Mr. JAMES MUIRHEAD has resigned from the position of chief inspector of electrical energy for the Province of British Columbia, which he has held for five years, to commence a private consulting practice. Mr. Muirhead was educated at Glasgow University and before joining the British Columbia Electric Railway Co., Ltd., in 1912, was successively with the Glasgow Corporation Tramway Department, the British Thomson-Houston Co., Ltd., Krumos, Ltd., and Bruce Peebles & Co., Ltd.

The French Académie des Sciences has awarded the Gaston Planté prize to M. J. BETHENOD, of the Ecole Supérieure d'Electricité, of Paris, for his work on "The Generation and Utilisation of Alternating Current at High Frequencies."

Mr. ROBERT INGLIS, late chief superintendent, Post Office Telegraphs, Glasgow, was entertained by his former colleagues on the occasion of his retirement and a presentation was made. Mr. David Miller, the new chief superintendent, presided.

Glasgow Electricity Committee is recommended to appoint Mr. J. IRVINE, at present book-keeper under the cashier in the Corporation Electricity Department, to the position of principal book-keeper at a salary of £350 per annum.

Mr. C. HOLMES WAGHORN, A.M.I.C.E., general manager of Walker Vehicles, Ltd., has resigned from that position and will shortly associate himself with another branch of the engineering industry. Letters addressed to him c/o Walker Vehicles, Ltd., Clare House, Kingsway, W.C.2, will be forwarded.

Mr. W. A. BROWN, who has been with the Pirelli-General Cable Works, Ltd., since its inception early in 1915, resigned his appointment as from December 31st, 1925. His private address is 87, Gloucester Road, London, S.W.7.

Mr. J. W. F. THELWALL, Commercial Secretary at Berlin, will be in attendance at the offices of the Department of Overseas Trade from January 4th to 9th inclusive for the purpose of interviewing British manufacturers and merchants interested in export trade with Germany. Interviews can be arranged by writing to the Department, 35, Old Queen Street, S.W.1, quoting Reference 6044 T.G.

Mr. ROBERT BRUCE has relinquished his position as manager of the electrical department of Engineering Supplies, Ltd., London, and has been appointed managing director of the Saxonia Electrical Wire Co., Ltd., of Roan Works, Greenwich, S.E.10.

In the course of his speech at the annual meeting of the Provincial Electric Supply Association recently, SIR HARRY RENWICK, the chairman, referred to the loss that the committee had sustained by the death of Mr. W. L. Madgen. He also mentioned the continued ill-health of the late secretary, Mr. T. W. Cole, who had been forced to relinquish all active work, but who carried with him into his retirement the best wishes of the committee and all who were associated with him.

Mansfield Electricity Committee has recommended the appointment of Mr. JOHN WHITE as electricity showroom attendant at £250 per year, rising by £12 10s. per annum to £300.

Mr. J. C. WESTHOVEN, the newly-appointed Deputy Director of Posts and Telegraphs, Victoria, who succeeded Mr. C. E. Bright, recently retired, took up his duties at the General Post Office, Melbourne, in November.

According to a copy of the *Sydney Morning Herald* just to hand the Sydney Electricity Committee has been discussing matters of management in a manner which reminds us of the controversy which formed the subject of editorial comments in the ELECTRICAL REVIEW for July 24th, 1925, page 123. Some weeks ago Mr. FORBES MACKAY left Australia to take up extended duties on behalf of the Department in London. From the paper now before us it seems that the Lord Mayor submitted to the Electricity Supply Committee in November a proposal that Mr. G. S. BOYD should be appointed acting deputy general manager during Mr. Mackay's absence. Some discussion followed, in the course of which Mr. Alderman McElhone, who took a leading part, said that if the proposal were adopted it would only create discontent and unrest amongst the senior officers of the power house as it entirely ignored precedent and the claims of a senior officer (Mr. Vine Hall). Mr. Maling, the acting general manager, is reported to have stated, in reply to questions by aldermen, that he had made the recommendation to the Lord Mayor that Mr. Boyd should be appointed to the position, though, on a previous occasion, Mr. Vine Hall, as senior officer, had acted as deputy general manager whilst he (Mr. Maling) was making investigations for the department abroad. A recommendation had been made by Mr. Forbes Mackay that Mr. Vine Hall should be appointed to that position. "But," added Mr. Maling, "I, as acting general manager, am now responsible for the management of the power-house and the department pending the return of Mr. Mackay, and any recommendation that Mr. Mackay may have made on the matter should have no bearing on what I, as acting general manager, now recommend." Later speakers called for the circulation of papers relating to the matter. The Labour aldermen present, being in a majority, forced the adoption of the Lord Mayor's minute, but agreed that the papers asked for should be circulated before the meeting of the City Council. Alderman W. P. McElhone said a great wrong was being done to a very valuable officer of the City Council for party reasons and through pique.

Mr. G. E. SMITH, engineer and manager of the Urban Electric Supply Co., Ltd., Dartmouth, since 1902, has relinquished his position in order to take up business in London. Mr. H. HAROLD, accountant, who has been with the company for 21 years, has been appointed manager.

This winter the demand on the Willesden Council's Electricity Department has exceeded 10,000 kW, and to mark this event the technical staff of the undertaking has made a presentation of books to the chief electrical engineer (Mr. A. W. BLAKE).

Obituary.—DR. T. VON MOLLER.—The death occurred on December 6th, at the age of 86 years, of Dr. Ing. Theodor von Moller, the founder of the electrical firm of K. & Th. Moller Gesellschaft, Brackwede, Westphalia.

DR. C. MICHALKE.—Dr. Carl Michalke, who had been associated for many years with the Siemens-Schuckertwerke, Berlin, and for the last 25 years was head of the company's technological bureau, died recently at Charlottenburg, aged 65 years.

DR. G. KLINGENBERG.—The death is announced from Berlin at the relatively early age of 55 years, of Prof. Dr. Georg Klingenberg, a well-known German electrical engineer and a director of the A.E.G., of Berlin.

MR. F. HANMER.—Mr. Frank Hanmer, joint founder of and for many years sole proprietor of Messrs. Powell & Hanmer, Ltd., of Birmingham, has just passed away.

Wills.—The late Sir BACHE EDWARD CUNARD, who was a director of the Chloride Electrical Storage Co., Ltd., and of the Lanarkshire Tramways Co., left unsettled property £13,123 gross and £12,638 net.

New Companies Registered.

Orion Lamps, Ltd. (210,506).—Private company. Registered December 19th. Capital, £2,000 in £1 shares. Objects:—To acquire the trade mark "Orion," No. 452,717, and to carry on the business of electricians, manufacturers of, dealers in, and agents for all kinds of electric lamps, radio tubes and apparatus, &c. The permanent directors are:—J. Kremenezky, 13, Wasagasse, Vienna 9, electrical engineer; T. R. Martin, 62, Wellington Road, Edgbaston, Birmingham, electrical engineer. No person, other than the first directors, connected with any person, firm, or company engaged in the manufacture of electric lamps, valves, heating and cooking apparatus or similar products, other than Joh. Kremenezky, of Vienna and Budapest, or person, firm, or company under Messrs. Kremenezky's control, shall be eligible to hold office as director or alternate director without the consent of all the directors. Registered office: Eldon Buildings, 15-17, Eldon Street, E.C.2.

Ramsbury Electric Supply Co., Ltd. (210,526).—Private company. Registered December 21st. Capital, £2,500 in £1 shares (1,500 ordinary and 1,000 preference). To adopt an agreement with the Ramsbury Electric Supply Co. for the acquisition of the business carried on by them, and to carry on the business of an electric supply company, &c. The directors are:—H. Smith, 73, Fellows Road, Hampstead, N.W.3, electrical engineer; S. G. Prince, Malt Street, Old Kent Road, S.E.1, electrician (managing director, with £260 per annum as remuneration). Solicitors: Ward and Melliur Smith, 35, Queen Victoria Street, E.C.4.

Pan-Electric, Ltd. (210,545).—Private company. Registered December 21st. Capital, £200 in £1 shares. Objects:—To carry on business as electrical, mechanical, civil and consulting engineers, electrical and general contractors, manufacturers of and dealers in electrical machinery, advertisement signs, signalling, telegraphic, telephonic and wireless apparatus, instruments of precision, &c. The first directors are:—J. E. Cochrane, 4, Lampard House, Royal Hospital, S.W.3; A. R. Greenaway, 35, Pearfield Road, Forest Hill, S.E.23, electrical engineer. Qualification, 1 share. Remuneration as fixed by the company. Secretary: A. B. Ford-Moore.

Western Radio and Supplies, Ltd. (210,419).—Private company. Registered December 16th. Capital, £500 in £1 shares. Objects:—To carry on wireless telegraphy and telephony, and photography business, &c. The first directors are:—C. H. Phillips, 11, Claude Place, Cardiff, engineer; H. F. Phillips, 5, Laytonia Avenue, Cardiff, engineer; R. C. Francis, 37, Westbourne Road, Penarth (all directors of Tressillian Motors, Ltd.). Qualification, 1 share. Remuneration as fixed by the company. Solicitors: Lewis, Morgan, Browne & Haslam, 31, High Street, Cardiff. Registered office: 18, Queen Street Arcade, Cardiff.

Official Returns of Electrical Companies.

Holophane, Ltd. (110,941).—Capital, £105,000 in 100,000 ordinary shares of 1s. each and 100,000 preference shares of £1 each. Return dated October 23rd, 1925. 100,000 ordinary and 60,757 preference shares taken up. £15,207 paid. £50,550 considered as paid. Mortgages and charges, nil.

Synchronome Co., Ltd. (120,465).—Capital, £2,000 in 1,400 ordinary and 600 preference shares of £1 each. Return dated November 4th, 1925. All shares taken up. £700 paid. £1,300 considered as paid. Mortgages and charges, nil.

Electric Supply Co. of Victoria, Ltd. (66,059).—Capital, £325,000 in 175,000 preference and 150,000 ordinary shares of £1 each. Return dated November 26th, 1925. 175,000 preference and 125,000 ordinary shares taken up. £50,007 paid. £249,993 considered as paid. Mortgages and charges, nil.

Yale Electric Power Co., Ltd. (60,493).—Capital, £20,000 in 3,300 preference shares of £1 each and 668 ordinary shares of £25 each. Return dated December 10th, 1925. 300 preference and 668 ordinary shares taken up. £15,300 paid on 300 preference and 600 ordinary shares. £1,700 considered as paid on 68 ordinary shares. Mortgages and charges, £5,567 7s. 9d. (bank overdraft).

Frinton-on-Sea and District Electric Light and Power Co., Ltd. (70,689.—Capital, £10,000) in 7,300 preference and 2,700 ordinary shares of £1 each. Return dated November 17th, 1925. All shares taken up. £10,000 paid. Mortgages and charges, £4,000.

Pacific and European Telegraph Co., Ltd. (36,683c).—Capital, £100,000 in £10 shares. Return dated November 12th, 1925. All shares taken up. £40,000 paid (being £4 per share called up). Mortgages and charges, £66,500.

Western Electric Distributing Corporation, Ltd. (79,057).—Capital, £140,000 in 70,000 preference and 70,000 ordinary shares of £1 each. Return dated October 15th, 1925. 52,655 preference and 54,510 ordinary shares taken up. £107,165 paid. Mortgages and charges, nil. Returns of allotments, made up to December 2nd, 1925, show a further 1,320 preference and 10,250 ordinary shares allotted for cash.

United Weldings and Electrical Co., Ltd.—W. H. Watson, of 29, Brown Street, Manchester, was appointed receiver on December 8th under powers contained in debentures dated March 25th, 1925.

Budleigh Salterton Electric Light and Power Co., Ltd.—Debenture dated December 8th, 1925, to secure £3,000 charged on the company's land at Budleigh Salterton, and the company's undertaking and property, present and future, including uncalled capital. Holders: Branch Nominees, Ltd., 15, Bishopsgate, E.C.2.

Astro Dynamo Co., Ltd.—Debenture dated November 30th, 1925, to secure £800, charged on the company's undertaking and property, present and future, including uncalled capital. Holder: F. U. Y. Weldon, 94, Alderman's Hill, Palmer's Green, N.13.

Paragon Electric Welding Co., Ltd.—Debenture charged on the company's undertaking and property, present and future, including uncalled capital, dated December 7th, 1925, to secure all moneys due or to become due from the company to Lloyd's Bank, Ltd.

City Notes.

Reports and Meetings of Electrical Companies, Dividend Results, &c.

British Columbia Electric Railway Co., Ltd.

The annual meeting of the company was held in London on December 23rd, Mr. J. Davidson (deputy-chairman) presiding. In moving the adoption of the report and accounts Mr. Davidson said that in the absence of the chairman, Mr. R. M. Horne-Payne, he would read his speech. The increase in every department of the company's business reflected the general expansion and prosperity of British Columbia during the year under review. (The report showing this improvement was abstracted in our last issue, p. 1026.) During the year over 4½ million dollars had been spent on capital account, mainly for additions to power generating plants, transmission systems, rolling stock and extensions to the light, power and gas systems. It was the policy of the company to keep every branch of the services in a position to meet the requirements of the communities served; this involved looking some distance ahead and making timely provision for the growth of the demand. The Bridge River site mentioned in the report was capable of yielding at least 200,000 h.p., although this would not be developed in its entirety at present. There was no doubt, however, that the expansion of shipping and industry in Vancouver would necessitate an increasing supply of power. It would be noticed that the accounts had been presented in dollars, following the advice of the auditors, who considered that the consolidated accounts should be in the same currency as those of the subsidiaries. Referring to the company's earnings in Vancouver, the chairman said that it had been held that a public utility company was entitled to earn 8 per cent. on its entire capital; taking the whole of the capital employed in the company's undertaking the return earned was only between 5 per cent. and 6 per cent. The report and accounts were adopted, and the retiring directors, Mr. R. M. Horne-Payne and Sir Ernest Harvey, K.B.E., were re-elected. Mr. G. P. Norton paid a tribute to Mr. Horne-Payne, who, he said, had been responsible for the starting of the company 30 years ago. The undertaking had done an immense amount of work and had played an important part in the development of British Columbia.

German Companies.

The report of the *Bank of Electrical Values*, of Berlin, records a net profit of 853,000 marks, permitting of the payment of a dividend at the rate of 5 per cent. on the ordinary shares.

The German newspapers announce that the interim balance sheet of the *Dr. Paul Meyer A.G.*, for the period ended September 30th last, shows a loss of 2,115,000 marks. It is proposed to withdraw the preference shares for 500,000 marks, to reduce the ordinary shares from 2,500,000 to 500,000 marks and then to increase the ordinary capital by 3,000,000 to 3,500,000 marks. The amount thus released will be devoted to writing off the loss and making further provision for depreciation. It is considered that the productivity of the undertaking will be improved if it is possible to carry out a scheme for the relinquishment of a number of unprofitable types of manufactures, simultaneously with the extension of bulk production.

French Companies.

The *Société d'Exploitations Electriques* has decided to pay a dividend at the rate of 17.50 fr. gross per share for 1924-25 out of net profits of 1,943,000 fr.

The *Société de L'Union Electrique* reports that the net profits increased from 49,000 fr. in 1923-24 to 162,000 fr. last year, but it is not proposed to make any distribution.

The *Société Industrielle des Téléphones*, which has declared a dividend at the rate of 50 fr. per share for 1924-25, reports that the multiple automatic exchange at Vichy has been opened for the French Post Office. The works at Calais, although not having had many orders for submarine cables, has yielded satisfactory results, thanks to the production of enamelled wires, which has been established there. At the Clichy works the normal development of the new manufactures has continued and given encouraging results, but a much more serious effort remains to be made in order to bring the works up to full output.

The *Compagnie Générale d'Electricité*, which has maintained its rate of dividend at 70 fr. per share for 1924-25, states that the results were more satisfactory than had been anticipated, having regard to the French financial crisis. The profits were higher by 3,154,000 fr. than in 1923-24, although the production of the industrial establishments on the whole showed a slight decrease. It has been decided to increase the share capital from 75 to 90 millions of francs in order to acquire the undertaking of the Compagnie Générale des Câbles, of Lyons.

Indian Companies.—*Tata Hydro-Electric Power Supply Co.*—The report for the year ended June 30th last records an income of Rs. 52,22,745 and an expenditure of Rs. 21,78,115. After providing for depreciation and writing off special expenditure, there is a balance of Rs. 22,24,053, and to this is added Rs. 38,544 brought forward, making Rs. 22,62,608. From this is distributed a final dividend, making 8 per cent., free of tax, for the year on the ordinary shares and a balance of Rs. 3,77,718 is carried forward. In 1923-24 the ordinary dividend was 7 per cent.

Andhra Valley Power Co.—The total income of the company for the year ended June 30th last was Rs. 54,21,869, and the available balance, after deducting working costs, debenture interest, &c., was Rs. 14,28,011. This is being distributed as follows:—Writing off the previous year's deficit Rs. 4,77,584; writing off other expenses amounting to Rs. 1,00,000; depreciation, Rs. 5,00,000; dividend of 7 per cent. on the preference shares; carried forward Rs. 5,046.

Adelaide Electric Supply Co., Ltd.—The gross revenue for the year ended August 31st, 1925, was £616,353 and the operating expenses and taxation amounted to £309,265, leaving a net revenue of £307,088—an increase of 34 per cent. The balance, after writing off the costs of share issues and providing for debenture interest, &c., was £223,324. From this sum £65,000 was transferred to general reserve (making £215,000), the preference dividends were paid, and a final dividend of 6 per cent. (making 12 per cent. for the year) was declared on the ordinary shares, leaving £924, plus £47,191 (£48,115) to be carried forward.

The A.E.G. Dividend.—It has been left to the American prospectus of the A.E.G., dealing with the issue of a 6½ per cent. loan for the amount of $10,000,000 in debentures, to disclose the fact that the dividend for the year ended with last September will presumably be at the rate of 6 per cent., as compared with 5 per cent. in 1923-24. An abstract from the prospectus further states that the provisional accounts for the past year show a material increase in the net profits and a satisfactory situation.

British Insulated Cables, Ltd.—A statutory meeting of shareholders of British Insulated & Helsby Cables, Ltd., held at Liverpool on December 21st, Mr. James Taylor, J.P. (chairman) presiding, confirmed the resolution passed at the extraordinary meeting on December 4th to change the title of the company to "British Insulated Cables, Ltd."

Newfoundland Power & Paper Co. — Meetings of the debenture holders were called on December 21st to approve of the issuing of further debenture stock. The holders of the "A" debentures agreed to the arrangement by a large majority, but as there was not a quorum of "B" debenture-holders the meeting was adjourned.

Stock Exchange Notices.—The undermentioned have been ordered to be officially quoted:—

British Insulated and Helsby Cables.—333,333 ordinary shares of £1 each, fully paid, Nos. 1,000,001 to 1,333,333.

Mersey Railway.—£281,429 three per cent. "B" debenture stock

Marconi's Wireless Telegraph Co., Ltd.—The dividend on the 7 per cent. cumulative participating preference shares for the half-year ended December 31st is being paid to-day (January 1st).

Quebec Power Co. — The following dividends are announced:—$1¾ per share on the 7 per cent. preferred stock, and $1¼ per share on the common stock for the quarter ended December 31st.

Stocks and Shares.

MONDAY EVENING.

WE started our review of electrical stocks and shares a year ago by saying that 1924 would deserve to be long remembered as one of the kindest to which proprietors of supply shares had been treated. This followed upon a state of affairs not very dissimilar in 1923. But the 1925 period carried on a good work that has been continuous, now, for three years. The electricity supply industry of London received, last spring, a fresh charter which meant a new extension of life. Investment has appreciated the change, and has bought steadily when shares came in—which was not often in some of the cases. The result is that prices finished 1925 with a remarkably robust appearance, as the following table shows. We add the highest and lowest prices of the year in order to round off the comparisons between December, 1924, and those of to-day:—

ELECTRICITY SUPPLY SHARES.

Ordinary share.	Dec., 1924.	H.	L.	Now.	Rise or fall.
Brompton	1⅞	38/6	32/-	1⅝	— ¼
Charing Cross	45/6	50/6	44/-	48/9	+3/3
Chelsea	37/6	42/-	35/-	42/6	+5/-
City of London	47/6	50/3	45/3	50/9	+3/3
County	52/6	61/3	51/-	59/6	+7/-
Kensington	10⅜	13¼	10¼	13¼	+ 2½
London	33/6	38/3	32/6	33/6	—
Metropolitan	37/6	40/9	36/6	40/6	+3/-
St. James'	12⅝	15½	12⅝	15½	+2⅝
South London	2¼	52/-	44/6	2⅝	+ ⅜
Westminster	11*	47/9	42/-	46/6	+ ⅝

* £5 shares.

Manufacturing and equipment shares have also been a feature of strength in the Old Year. Something like a mild boomlet occurred during the summer, when optimism talked largely of possible increases in dividend. Several satisfactory announcements coloured the rumours, and the companies are known to be going ahead in profitable style. The present Government was expected to benefit cable and electrical equipment companies by tightening up the Safeguarding of Industries Act, but less has been done in this direction than some people hoped. The sensational rise in the price of raw rubber was used as an argument, by certain of the large trade users, for the apprehension that it might handicap the manufacturing firms, but the protest died a natural death: rubber, rubber shares, and equipment shares have gone on rising. Half-a-dozen representative examples in this market are included in the table that follows:—

MANUFACTURING.

Share.	Dec., 1924.	H.	L.	Now.	R'se or fall.
Babcock	2⅝	57/6	47/6	2 5/16	— 7/16
British Aluminium	29/3	39/-	27/6	38/-	+8/9
Callenders	2 1/16	3⅜	2⅞	3⅛	+ 7/16
General Electric	21/6	30/3	21/3	28/-	+6/6
Henleys	58/9	3⅜	2⅞	70/-	+ 11/16
India Rubber	17/6	23/3	17/3	21/3	+3/9

The engineering branches of trade, with others closely allied to them, have felt the effect of the industrial lassitude in most of the "heavy" departments. Vickers have lately declared for a capital reorganisation, and a writing-off of 13s. 4d. from each £1 ordinary share. Several more companies are expected to follow suit. But these misfortunes have passed over the heads of electrical undertakings, which have suffered only indirectly from the quietude of the Midlands, the North and the West of England.

Turning to the cable companies' stocks, the year has been uneventful. The annual reports and meetings served to demonstrate that cable business is reviving from the effects of post-war depression. The Eastern group maintained its 10 per cent. tax-free dividend on the four ordinary shares and stock in the quartette. Wireless competition is no longer regarded as a reason for nervousness. Indeed, the wireless shares are out of favour; prices are down rather heavily. A few spurts, none of them of any consequence, occurred in this section, but the rubber boom led to sales of Marconi shares in order that the money might be employed in the more popular market. United River Plate Telephones have risen substantially, taking into account the rights that accrued from the new issue of shares. Automatic and International Telephones are also features of strength, and our usual comparative columns bring out these changes:—

The most noteworthy movement in our price-lists is the jump in Brazilian Tractions. The price started 1925 at 58. Upon the increasing traffics, the advantageous movements in the milreis and upon buying said to be for control purposes, the shares have gone ahead by leaps and bounds. Less dramatic, but very noteworthy, has been the rise in British Electric Traction ordinary, which stood at a shade under 100 twelve months ago. The Home Railway group makes a poor showing, and is the one market in the Stock Exchange that has been outstandingly dull for the greater part of the year. Labour demands and dwindling traffics have led to a general weakening of prices, although the final quotations are above the lowest of the year, as these figures illustrate:—

RAILWAY STOCKS AND SHARES.

The Bank Rate has risen 1 per cent., to 5 per cent., during the year. This had an oblique reference to the return of the nation to a gold standard, but it exercised no more than a transitory influence over Stock Exchange markets. Business has been active, speaking generally, and the prospects for investment and speculative values are demonstrably good. Cordial wishes for a Happy New Year are politely offered to the patient reader of the weekly notes on Stock Exchange markets connected with electrical issues.

Electrical Wiring Installations.

A Comparison of Systems and an Analysis of their Costs.

By I. SCLAR, A.M.I.E.E.

(Abstract of Paper read before the DUNDEE SUB-CENTRE *of the* INSTITUTION OF ELECTRICAL ENGINEERS.)

THE paper deals, in an unbiased way, with the commonest systems of electrical wiring and present practice, whilst the figures refer to average installations; there will be cases, of course, where the figures instanced will be well out, but a comparison of some of the merits claimed by the advocates of the various methods shows how the different systems affect the cost of wiring in practice.

The importance of the subject cannot be too greatly stressed, and insufficient consideration has been given to this subject, at least in proportion to the amount of capital, labour, and other direct and indirect interests involved in the electrical installation industry, and other industries depending upon it, and to the proportion that all these interests bear to the whole electrical industry. It is due to the want of this consideration and discussion that the electrical installation side has not advanced so much as other sections of the industry; though great forward strides certainly have been made, they are not in keeping with the large volume of business being done, or what has yet to come.

I agree that there is a lack of " push " about the contractor, but am of the opinion that there is a greater lack on the side of the electricity supply authority, in view of its more fortunate position; it usually has a monopoly of the goods it has to sell, which are all of the same type and class, so there is no quality competition. It can ascertain the exact cost of the one commodity it has to sell, whereas the contractor very seldom gets two jobs alike, and practically every estimate job contains elements of risks which affect the profit he has aimed at. However, we all agree that a lot more can be done by co-operation. When comparing the permanency of one system against another, the fact of the matter is that most installations have not been in existence long enough to enable reliable judgments to be made.

I have based my costs on the latest issue of the I.E.E. wiring rules and on standard materials at the standard trade prices ruling at the beginning of November. The I.E.E. rules may not be agreed with in their entirety, but they have common sense and sound principles which will make themselves recognised, through time, as a sure foundation for reliable work. If you demand a good article in sufficient quantities you will get it as cheaply as an inferior article. Permanency and upkeep are often lost sight of when comparing prices. The average life of a building, even of ordinary brick construction, is reckoned to be between 75 and 100 years, and if the electrical wiring installation is to last that time, a sound job must be made. It behoves us to take more care in the selection of a wiring installation, for permanency is often given too little consideration and in new building work our sense of proportion regarding costs is often misdirected.

The electrical installation costs for a new building may vary from about 3 to 10 per cent. of the total cost of the building. Taking 6 per cent., the difference between a good installation and an indifferent one may be, say, one-third of the price of the installation, only about 2 per cent. of the total cost of the building. Supposing the money is borrowed at 5 per cent., then a 2 per cent. difference would be, say, £20 on a £1,000 house, and the interest on this would be 20s. per annum; it is quite easy to run up a bill of 20s. a year on repairs of an inferior installation, as contractors cannot give much for £1 nowadays. Again, the depreciation on a cheaper installation will be at much greater rate.

In some housing schemes at the present time the cost of the usual installation per house is about £8 to £10 for the average type; supposing by cheaper and often admittedly less reliable methods of wiring we were able to reduce this cost to £5 per house, the actual saving in interest would only be about 5s. per year, which will hardly repair a broken flexible. The cry for cheaper installations is an exaggerated one, and we often hear the high initial cost of the installation blamed as being the means of allowing other sources of illuminant to be installed. The probable difference between a gas installation and a good electrical one is perhaps about two per cent. of the cost of the building, and when the advantages of electricity are taken into consideration this difference should never deter the installation of electricity.

The probablity is that the responsible party has been slow in pushing home the advantages of electricity, and I would say the supply engineer is entitled to do a greater share of the propaganda work as he stands to gain something if the deal is brought off. We don't seem to have enough confidence in the thing we are selling; contractors and supply engineers should act as if gas was out of it altogether. Gas companies are beginning to realise that they are fighting a losing battle; a great gas-mantle manufacturing firm is advertising electrical radiators. We may know the advantages of electricity, but we do not know the disadvantages of gas, and I would suggest that everyone connected with the actual sale of the commodities " electricity " and " electrical installations," should live a double life for a time.

" Safety-first " means the adequate earthing of all appliances and the easiest and most automatic way is to make use of the outer sheathing of an " earthed " system. This deals a severe blow to " insulated " systems, in that to conform to latest regulations an earth conductor is required to be run throughout the whole system. The only practical way to do this is to have an extra wire run under the insulated casing parallel with the current-carrying conductors, which, of course, adds considerably to the cost of the system, to say nothing of the danger of non-continuity at joint boxes, switches, &c., and the labour involved in making such an earth wire continuous. Earthing each appliance to the nearest earth-connected body, actually at the point where such earthing is essential to conform to regulations, would be impracticable, unreliable, and probably unsightly. The difficulty might be got over by using insulated switches and appliances, but there is a much greater factor of safety with a switch in a bathroom whose metal non-current-carrying parts are earthed, as surface leakage due to moisture would take the earth path before the comparatively higher resistance path of the human body.

The point I want to emphasise is that one might be able to run much longer with a faulty installation where the covering of the wires is insulated from earth-connected bodies, than with a system of insulated wires with an earth-connected enclosed covering. Accidents have occurred with cab-tire trailing cables in collieries, with an earth wire actually incorporated in the cable itself, due to a damaged live conductor charging some apparatus with fatal results. If the earth conductor had taken the form of an outside flexible metallic tube, the danger would probably have made itself felt and would have been removed.

A cable with a separate earth wire is not as safe as a cable with an enclosed surrounding earthed tube. As regards fire risks, there is always the danger of open sparking with the insulated system which might not be present with the enclosed earthed systems.

Is conduit or the lead-covered cable easier to make continuous so far as the earthing goes, apart from the extra mechanical protection of the one which is agreed upon? I recently carried out tests with the following result :—

Resistance per 1,000 yd. of lead sheathing = 8 ohms for 3/.036 twin cable.

Resistance per 1,000 yd. of h.g. welded ¾-in. enamelled conduit = 1.16 ohms.

Resistance of standard coupling for ¾-in. conduit = 0.0015 ohm, screwed tight and clean.

Resistance across a universal box, not B.E.S.A., = 0.003 ohm.

Tube was tapped into box at each end for about ½ standard length of thread to B.E.S.A. specification.

Resistance of conduit to an adaptable standard square box when connected by means of standard lock-nuts at each side of the box = 0.0035 ohm, but when threaded into the box = 0.002 ohm.

Resistance across tinned-brass joint box with 3/.036 cable and the bonding tightly made = 0.001 ohm.

Very erratic results could be obtained, as very much depended on the tightness of the threads and whether the enamel was properly scraped off. The tests on the conduit were carried out without cleaning the threads, just as the boxes and tubes are supplied from the makers and as they would be used by the average workman. I found that it was much easier to get consistent results across the lead-covered cable boxes, and that even a fairly slack connection gave practically the same resistance as a tight one, due to the clean contact with the lead; therefore, it seems easier to get better bonding at boxes with lead cable than with conduit, and a lot of the cry about bonding at boxes is exaggerated.

The resistance of the lead is about seven times that of conduit, but taking into consideration the greater resistance at couplings, inspection boxes, &c., for the same length of runs and with the same amount of care in both cases, the resistance of the bonding of the conduit job should be about half that of the lead-covered one, which means that with the same fault resistance in both cases there is more probability of the fuses blowing quicker with conduit than with the lead-covered system. Again, lead cable sheathing has a lower melting point than conduit, say about 1/5th, and therefore there would be a greater factor of safety against fire, especially in favour of conduit.

In order to form a basis for the comparison of costs, most installations can be split up thus :—

Part of installation.	Average proportion of cost.
1. Mains and sub-mains	5 per cent.
2. Lighting and switch points, lighting and heating plug points, *wiring only*, no switches, plugs, &c.	35 ,, ,,
3. Main and sub-main switches	4 ,, ,,
4. Main and sub-main distribution boards	6 ,, ,,
5. Branch switches, plugs and sockets ...	15 ,, ,,
6. Light fittings and radiators, &c., also lamps	35 ,, ,,

The above average figures deal with the installations at present being carried out in offices, dwelling houses, and shops, and allow for all the necessary labour. The important point to observe is that (1) and (2) are the only sections where the cost of the installation is materially affected by the system of wiring employed. The actual "wiring" cost made up of items (1) and (2) ranges between 20 and 50 per cent. of the total cost of the installation. The lower figure is applicable to high-class installations where there are many special plugs, switches, and fittings; the higher figure is probably a maximum for 90 out of 100 complete installations and refers to the very humblest, that is, the housing-scheme type, where the very plainest of fittings and shades are installed. Theatres, hospitals, schools, &c., where it would be dangerous if too many lights in one section failed at the one time, often require special consideration, and the more lights that are fed from each way to the board, so will the cost of the wiring be cheapened, but I may suggest that this cost is not affected to such great proportions as is often imagined. I have often found .003 cable specified by engineers, with the consequent extra expense of larger tubes, &c., for installations where the .002 size would be ample, and I can only conclude that this has been done through force of habit and not because of any advantage likely to accrue. Mains for lighting are regulated by their distance from the supply point and the total rating, and it is safer to assume that a diversity factor should not be taken into account and that the total loading may be on all at once. In the case of heating mains, there is less probability of all the radiator plugs being connected at any one time, and discretion can be used to cut down the size of these mains.

In most cases the mains do not form a great proportion of the total cost of the wiring, and it is cheaper to increase the size of the mains than to try and get over difficulties of voltage drop by increasing the section of the cables to the actual outlet points. For heating probably a 2-kW heater is the minimum and on a 250-volt circuit such a heater will take 8 amps., so that we are really restricted by the I.E.E. regulations to a maximum of two such heater points on the one circuit. We would probably find that a good policy here would be to use a 7/.036 cable to the first point and loop a 7/.029 cable to the next one in the same run.

Is it really necessary to keep all heating and domestic circuits separate from the lighting circuits, especially in view of a tendency to adopt one tariff for all purposes? A fuse to protect a 2-kW radiator is of no use to protect a lamp, and the smaller cables and flexibles to the lights, if they did not actually fuse, would heat up sufficiently to render their insulation unreliable for future use. However, neglecting safety, is there really any claim as regards a large saving in cables?

There will be a saving in mains, for the same mains that feed the heaters could feed the lights, though in practice this might not amount to much, as the actual cost of mains to a fuseboard is about 5 per cent. of the total cost. The proportion of cost of heating means to lighting mains is as 2 to 1 on an average, so that if we cut out the lighting mains and do not proportionately increase the heating mains, the saving in mains will only amount to about 2 per cent. of the installation total cost. In practice, in installations which might show considerable saving in mains (due to long runs) on the one main idea, it would be better for the sake of voltage regulation to keep the mains separate. To loop off the heating plugs, or to run the heating-plug circuits in the same direction as the lighting points, usually will require more wiring than feeding, say, 10 lighting points from one circuit and keeping the lighting away from the heating plugs. Again, to make provision for the future looping of heating plugs more heavy wiring would be required than would be necessary if we just wired for those heating plugs wanted at the time. Also the total first cost would be increased, and the object of the system would be defeated In this matter we are in a quandary, for if we want to conform to the I.E.E. regulations we should not connect more than two heating points, so that we could never reap the full benefit of the one circuit for heating and lighting. Though it looks all right on paper, in practice it turns out very different, for the reason that a house is built more or less in the form of squares, and not in one long line like a street.

While on the question of saving, a considerable one is gained by the elimination of the "drop down" to switch level; by using a ceiling switch we could save 40 per cent. on each light and switch point, or from 10 to 20 per cent. on the cost of a complete installation. On a housing scheme this method would save about 25 per cent. of the cost of the installation.

We will now compare the conduit, lead-alloy flat-twin and three-core, and flat-twin and three-core tough-rubber systems. There are many classes of conduit, which fact materially affects the cost and efficiency, but we will adhere to the heavy-gauge screwed type. The chief advantage of a conduit system is the good mechanical protection afforded, and the chief disadvantages are condensation, rusting of the conduit itself, and the supposed high initial cost due to the greater amount of labour required in erection. Is the extra mechanical protection as necessary as it is made out to be? It would be interesting if we could arrive at some idea of the amount of damage done by nails or other careless handling to the other systems, which might have been prevented if they had h d added protection equal to that of conduit. It is quite possible for an installation to test all right after completion, though it may have been damaged in erection and develop annoying faults later on. In this respect tough-rubber cable would have the advantage over lead. Condensation is greatly exaggerated, and where such faults have occurred it is more than likely that the system has been installed in an unsuitable situation where special provisions should have been made to begin with. In 99 cases out of 100 condensation is not likely to trouble average dwelling houses, offices, and other type of building.

Conduit usually calls for a greater amount of labour in erecting, but many of the so-called labour-saving, surface, lead-covered and tough-rubber systems really involve more labour than a conduit system. In fact, I will go so far as to say that the conduit surface job is the only proper surface job. I favour conduit by reason of its rigidity, as the pipes and outlet boxes support each other in such a way that the actual amount of fixing required is much less than with the more flexible systems.

The trouble with surface systems of the lead and tough-rubber types is the total unsuitability of most of the outlet and joint boxes designed. The chief reason for cable makers designing flexible cable systems is that they want to sell the cable required for these systems, but they would sell more if they advertised less in the exaggerated and ridiculous way they do, and designed practical outlet and joint boxes. There is no need for small joint boxes, as in nine cases out of ten they are hidden, and probably in the tenth case, if it is a surface system, a decent size joint box would not look so ugly in proportion to the many cables leading to it.

There is no need for cable makers to design all kinds of different boxes for the sake of claiming a patent system; they would sell their cable under the same circumstances if we had some sort of regularity in the type of boxes and fixings. The cable makers can combine for other purposes, so why can't they combine once more? If we are to conform to the I.E.E. rules we require an earth wire for the cab-tire cable, so that we will have 50 per cent. more joints to make.

From the following tables assistance may be derived in ascertaining the most economical system for a particular condition :—

Table I. Labour Charges for Wiring Only.

	Conduit.	Lead alloy.	Tough rubber.
(a) Concealed job—new house in course of erection :			
Cutting away and making roads ...	20	5	5
Measuring and cutting tube or cable and bending to position	35	10	10
Erecting cable or conduit with necessary fixings	20	25	25
Wiring conduit or cable	10	—	—
Bonding conduit or cable	—	5	—
Making joints	5	15	20
Making good	10	5	5
Totals	100	65	65
(b) Concealed job—house already built :			
Cutting away and making roads ...	35	15	15
Measuring and cutting tube or cable and bending to position	45	15	15
Erecting cable or conduit with necessary fixings	35	25	25
Wiring conduit or cable	10	—	—
Bonding conduit or cable	—	5	—
Making joints	5	15	20
Making good	20	10	10
Totals	150	85	85
(c) Complete surface job :			
Cutting away and making roads ...	5	3	3
Measuring and cutting tube or cable and bending to position	35	10	10
Erecting cable or conduit with necessary fixings	25	50	50
Wiring conduit or cable	10	—	—
Bonding conduit or cable	—	5	—
Making joints	5	15	20
Making good	3	3	3
Totals	83	86	86

Table II. Material Costs.

(i) *Conduit installation :*		
Conduit	35	
Cable, 600-meg. Association	57	
Boxes and saddles, &c., including switch and plug boxes, ceiling boxes, &c., all tapped for necessary switches and accessories	8	
Total	100	units.
(ii) *Lead-alloy system :*		
600-meg. Assoc. cable, twin and three-core...	78	
Boxes and fixings, bonding clamps, &c. ...	3	
Wood blocks, wood switch and plug blocks, &c., all bored and ready for accessories ...	2	
Protective sheathing at switch runs to I.E.E. regulations	7	
Total	90	units.
(iii) *Tough-rubber cable :*		
Cable, 2- and 3-core, with earth wire ...	104	
Boxes and fixings	2	
Wood blocks, &c., as before	2	
Protective sheathing	7	
Total	115	units.

Table III. Summary of Costs.

(i) *Concealed installation—house in course of erection*:

	Wiring labour.	Wiring material.	Total cost of wiring.
Conduit	100	100	200
Lead alloy	65	90	155
Tough rubber	65	115	180

(ii) *Concealed job—house already built*:

	Wiring labour.	Wiring material.	Total cost of wiring.
Conduit	150	100	250
Lead alloy	85	90	175
Tough rubber	85	115	200

(iii) *Surface job*: (*deduct* 6 *units from lead-alloy and tough-rubber for less protective covering*):

	Wiring labour.	Wiring material.	Total cost of wiring.
Conduit	83	100	183
Lead alloy	86	86	172
Tough rubber	86	111	197

Assume, for discussion, that the total cost of the rest of the complete installation is 300 units; then in the first case:

	Wiring.	Remainder of job.	Total cost.
Conduit	200	300	500
Lead alloy	155	300	455
Tough rubber	180	300	480

and thus the saving by using the cheapest method in place of the dearest is 9 per cent. In the second case:

	Wiring.	Remainder of job.	Total cost.
Conduit	250	300	550
Lead alloy	175	300	475
Tough rubber	200	300	500

which shows the saving by using the cheapest method in place of the dearest to be barely 14 per cent., whilst in the third case:

	Wiring.	Remainder of job.	Total cost.
Conduit	183	300	483
Lead cable	172	300	472
Tough rubber	197	300	497

indicating the tough-rubber cable to be the dearest in this case, and the cheapest system is only 2 per cent. cheaper than conduit. In the case of straight runs for long lengths of mains, or in large buildings served by large single units, the conduit system might work out considerably cheaper than any of the flexible systems, as the erecting and bending items of the work would be considerably reduced.

The above figures show that the conduit installation is more proportionately expensive than the others for the house already built where we want to hide most of the work; flexible systems are best employed on installations like these. The tough-rubber system, even allowing for an earth wire, is not very much dearer than the lead-alloy system, and manufacturers would be well advised to produce a suitable cable incorporating an earth wire. Such cable might require to be more durable, as it is in direct contact with the disintegrating forces, whereas v.i.r. cables have the added protection of conduit or lead sheathing.

As present practice goes, there is really very little difference in the final price of the installation, no matter what system we use; this being the case, we should aim for the best possible. The conduit system is too rigid and affords rather too much protection; the lead-alloy system is too flexible and not sufficiently protected; and the tough-rubber system (though made with more durable insulation) is not sufficiently protected and not as safe as the enclosed earth-conductor system. Therefore, an ideal system would be, say, a twin or three-core cable insulated with tough-rubber, and protected with galvanised layers of thin steel tape wound spirally, which armouring would in turn be protected with tough-rubber. Such a cable should be round, instead of flat, as the former shape is easier bent, handled, connected to fittings, and less liable to become twisted or kinked. It would be less flexible than a lead- or tough-rubber covered cable, but that is what is required, and yet more flexible than conduit. However, such a cable would be fairly expensive, but I think it would be suitable for a greater number of situations than any of the separate systems, and in view of a greater demand its price might come down to an economical level.

We all want cheaper installations, but we must not let that demand be conceded at the expense of efficiency and quality; there is a limit to simplicity, for very often the simpler an installation is, the less efficiently will it be carried out. If every Tom, Dick, and Harry is to carry out wiring work, contracting will deteriorate.

The electricity supply side does not assist the installation side of the industry as much as it ought to, and often retards it by silly pets and regulations. What is considered safe in the one town should surely be as safe in another! If power supply authorities' technical staffs cannot agree amongst themselves as to what is safe, how can they expect the half-savage, poor, uneducated contractor to know? Electricity supply authorities could not do better than work to the I.E.E. rules, and scrap all their own pet ones, as standardisation would lead to an immediate decrease in the cost of installations and do more good than blaming the contractor.

Super-Heterodyne Radio Receivers.

Some Notes on Theory and Practice.

(*Abstract of Paper read before the* JUNIOR INSTITUTION OF ENGINEERS.)

MR. A. E. BOWYER-LOWE, in a recent lecture on the above subject, explained that, while Major E. H. Armstrong undoubtedly did develop the idea, in fact, many had independently discovered the method, the credit for the invention must be given to Lucien Levy, of France, whose English patent was applied for on August 2nd, 1918 (eleven months earlier than Armstrong's), while Levy's French patent is dated August 4th, 1917, whereas Armstrong's date is December 30th, 1918 (seventeen months later). Levy's patent is the property of Standard Telephones and Cables, Ltd. (formerly the Western Electric Co.), to whom a royalty of thirty shillings is due from any amateur who constructs such a receiver, not only from British components, but foreign as well.

The dearth of information regarding super-heterodyne receivers in the British radio journals has resulted in those experimenters who are keen on this method of reception considering the super-heterodyne in terms of American practice, and in judging anything which differs as heresy. For instance, when his company introduced intermediate frequency transformers peaked at 150 kilo-cycles, *i.e.*, 2,000 metres, it received numerous letters pointing out that this must be a printer's error, as in the various writers' experience 30, 40, or 50 kilocycles should have been the wavelength chosen.

Theoretically we might choose any convenient frequency or wavelength for the beat note, or intermediate frequency, but there are practical limitations and several schools of thought on this point.

When dealing with super-heterodyne reception we have to think in kilocycles instead of wavelengths in metres, and any conversion table shows that the increase in frequency is not directly proportional to the decrease in wavelength, but increases very rapidly as the wavelength is shortened, a very important fact to remember. For instance, between:

200 and 250 metres there is a difference of 300 kilocycles
400 and 450 ,, ,, ,, ,, 83 ,,
550 and 600 ,, ,, ,, ,, 45 ,,

We change the frequency of the incoming signal (usually shorter, *i.e.*, greater wavelength) in order to use high-frequency amplification to better advantage, and if we were receiving one definite wavelength only, such as c.w. Morse signals, we could use transformers very sharply tuned so as to pass that wavelength only; but as we are mostly concerned with telephony where, in addition to the fundamental wavelength, we have to pass the side bands as well, transformers must be so designed as to pass from 5 to 9 kilocycles either side of the fundamental in order to avoid distortion. Now, while 5 kilocycles either side of 300 metres covers a wavelength range of 298½ metres to 310½ metres, or 13 metres, the same width of side bands at 1,000 metres gives a range of 34 metres, while at higher wavelengths still the ranges are:—

at 4,000 metres the range is 540 metres
at 7,000 ,, ,, ,, 1,750 ,,
at 10,000 ,, ,, ,, 3,450 ,,

Therefore, at the shorter wavelengths it is possible to use transformers which are more sharply tuned than when the higher wavelengths are used; in fact, it is difficult to make a good transformer at 30 kilocycles which should be sufficiently broadly tuned to eliminate distortion.

Unfortunately while it is theoretically possible to obtain higher amplification with longer wavelengths than with short ones, the large amount of wire that is necessary to obtain the required inductance results in a bulky and expensive transformer, so that the size of wire is usually cut down to a minimum, resulting in a loss due to high-frequency resistance and decreased amplification.

A partial solution to this difficulty was the introduction of steel cores which, by increasing the inductance, allowed of less wire being used, but such cores flatten out the tuning too much unless the wavelength is increased to a point where the flattening just covers the side bands, somewhere in the region of 30 to 50 kilocycles. At these frequencies amplification should be good, but steel cores are responsible for very great hysteris losses which not only create distortion of another kind, but cut down the amplification which theoretically should be possible. There is also the danger that the amplification curve may overlap into the audible frequencies and give rise to background noises.

Americans apparently do not mind distortion or noisy back-

ground so long as they can get distance, but this kind of reception does not find much favour here. The air-cored transformer was the only one possible under the circumstances, the choice of wavelength being the next consideration. We can set up a beat note by heterodyning the signal with a frequency either longer or shorter than the original, and as a consequence we shall be able to tune in a given station at two points on the oscillator dial. Using 30-kilocycle intermediate transformers these two points are very close together and it often happens that two stations are brought in together owing to the upper oscillator setting for one station being the lower setting for another. As we go lower with the intermediate frequency, however, the distance apart at which the same station comes in increases until at 143 kilocycles we have to move the dial through half its travel before one station appears a second time. At 143 kilocycles it is possible by careful design to obtain very high amplification, partly due to the fact that we can use comparatively heavy gauge wire, thereby lowering the high-frequency resistance, and partly due to the fact that the distributed capacity of the winding is low.

It is essential that the various transformers in a set be matched so as to pass the same band of frequencies, and at the lower frequencies this is a comparatively easy matter, because it does not matter within a few hundred metres exactly where the peak is, but as the frequency is raised matching assumes very much more importance and militates against the mass production methods of our transatlantic friends, as with high-amplification h.f. transformers it is a physical impossibility to ensure that every one shall peak at the same frequency; consequently every transformer has to be very carefully measured for frequency and sets sorted out which are alike, ordinary methods of measuring wavelengths not being sufficiently accurate.

After having taken all this care in matching it is essential that the wiring shall be carefully done, and it is necessary that the intermediate valves and second detector be matched for interelectrode capacity, the first detector be sensitive, and the oscillator valve capable of oscillating strongly without excessive plate current; further, and equally important, they must be free from noises of their own. The generally expressed opinion in America that any oscillator will do, is not borne out in the author's experience, as many types give rise to troublesome harmonics, involving the same stations appearing twice for each strong harmonic, which trouble is also apparent when using a combined detector and oscillator; in fact, the latest development of Major Armstrong uses the second harmonic of the oscillating detector valve to beat with the incoming frequency to provide the intermediate frequency.

Mr. Lowe found that as the plate voltage on the first detector valve was reduced the receiver became more sensitive and actually would operate quite well with no plate voltage at all, but subsequently he joined the plate of the first detector to the grid-filament circuit of the oscillator, which provided enough plate voltage, although alternating, and also serves to couple the two valves together, dispensing with the coupling coil.

He later found that this method was the same as that used by R. E. Lecault, under the name of "Ultradyne," who says that the incoming signal "modulates" the radio frequency from the oscillator, but the actual operation is the same as any standard superheterodyne, the main difference being the absence of an underlying direct current on the detector plate. Because the energy of the oscillator is fed into the plate circuit of the first detector instead of into the grid circuit, this method radiates to a much smaller amount than the ordinary method and certainly is distinctly more sensitive, especially on weak signals.

The output of the first detector to the intermediate frequency transformer is dependent on the product of the signal voltage and the voltage generated by the local oscillator, so that it is important that the oscillator be as good as it is possible to make, and that the frame aerial circuit should be of low resistance and free from losses. Stations up to three or four thousand miles can be received on a frame aerial only and distant reception seems limited only by the amount of noise present in the ether. Any superheterodyne which requires the use of an outside aerial is falsifying its title.

In answer to questions raised during the discussion which followed the lecturette, Mr. Bowyer-Lowe made it clear that the super-heterodyne set was not the type to use for local reception, nor could it be expected to give reproduction which would be considered entirely undistorted by a critical ear; it was purely for long-distance reception, for operating a loud speaker practically free from distortion, and without interference.

Magnetic Sheet Material.

Power Losses at High Flux Densities.

By C. E. WEBB, B.Sc.(Eng.), A.M.I.E.E.

(*Abstract of paper read before the* INSTITUTION OF ELECTRICAL ENGINEERS.)

AT the present time there is a marked tendency amongst designers of electrical machinery to employ higher flux densities in electrical sheet steel than have been customary in the past, and, in consequence, to demand guaranteed figures for the total power losses due to hysteresis and eddy currents at correspondingly higher densities. It is therefore a matter of increasing importance to obtain reliable and accurate knowledge of the way in which the power losses vary with the flux density at high densities, particularly in the special brands of sheet material which are now so extensively employed.

Of the two components (hysteresis and eddy currents) of which the total loss consists, the hysteresis loss is usually the more important, and is also the one concerning the law of variation of which there is more uncertainty. There is general agreement as to the validity of Steinmetz's empirical law that—Hysteresis loss in ergs per cm^3 per period $= \eta B^x$, where x is a constant index for any given material, having a value of approximately 1.6 for flux densities between about 4,000 and 10,000 C.G.S. units; but at higher densities surprising differences between the results of different investigators appear to exist, as is made evident in the author's brief survey of some of the principal papers bearing on the subject.

Some investigators find Steinmetz's law to apply closely up to the highest flux densities at which tests could be carried out, whilst others record more rapid variations of hysteresis loss with B in the region of B=10,000—16,000. The extent of the departure from Steinmetz's law also varies considerably, some observers finding a maximum exponent of approximately 2 and others obtaining values as high at 3.2.

In the paper a series of tests (both by a.c. and ballistic methods, carried out at the National Physical Laboratory) on a wide range of sheet materials is described, the results of which appear to confirm the increase in the exponent of B in the expression for the hysteresis loss at values of B between 10,000 and 15,000. They also show comparatively little difference between the various specimens of sheet material tested.

The construction of a new Lloyd square for tests at still higher flux densities, and a further, more detailed, series of tests (both a.c. and ballistic) on a representative specimen of each type of material, making use of this square, are then described. These tests were carried up to B=17,000 or 18,000 and, while confirming and extending the previous results of increased exponents of B for values up to 16,000, indicate a rapid decrease in the exponent at the highest values of B employed.

The test specimens were provided by Messrs. J. Lysaght, Ltd., and comprised samples of lohys, special lohys, high-resistance and medium-resistance grades. To summarise the conclusions deduced from the results recorded, it has been shown that:—

(1) In all the principal types of commercial sheet material in use at the present time, the rate of increase of the hysteresis loss with B is considerably greater at flux densities above B=10,000 than is indicated by Steinmetz's law, or than appears to have been generally realised. In most specimens over a small range in the neighbourhood of B=15,000 the variation is as rapid as the 2.5th power of B, and in some cases it exceeds the 3rd or even the 4th power of B.

(2) Above about B=16,000 the rate of increase falls off very rapidly and drops again to the 1.6th power or even lower.

(3) The eddy-current index at high flux densities is fairly constant and generally rather less than 2.

(4) The apparent values of hysteresis and eddy-current losses in ordinary commercial sheet material depend to a considerable extent on frequency. Experiments not recorded in the paper indicate that this is due to non-homogeneity of the sheet. These effects do not appreciably alter the exponents observed.

Discussion in London.

Mr. H. S. HOLBROOK commenced the debate with the remark that no one had hitherto explored the subject to the extent that the author had done. He explained that American and Continental manufacturers ran their transformer cores at over 20 per cent. greater flux densities than was customary in this country, and so they were able to produce smaller and cheaper plant; therefore, the paper was of practical value. Scale on alloy steels was one of their greatest troubles.

Mr. G. S. MARRIS, who was understood to say that he had been carrying out similar experiments at low densities, pointed out that in the subject of magnetisation so much was of an empirical nature that one hesitated to abandon anything which might be a guide. The author had shown that the Steinmetz

law was applicable only within the range for which it was originally put forward, which fact had been emphasised by the late Dr. Steinmetz himself in one of his books.

Mr. L. SIMMS said that the author had accomplished that which he had set out to do, but he (the speaker) was not so sure that the paper had put the matter beyond all doubt. He referred to the ways in which it was possible that errors might have been introduced in the testing apparatus and, in view of the fact that the coils and transformers were usually run at lower flux densities than rotating machinery, asked the author whether he could assure them that his results were equally applicable in both cases. There was considerable room for similar investigations at audio frequencies.

Mr. H. W. TAYLOR drew attention to the possibility of the use of silicon steels and high-resistance materials increasing the losses; at high densities they might be greater than if ordinary iron had been employed. The addition of silicon to steel, besides introducing advantages, increased the permeability at low density, and that might be the cause of the trouble experienced with increased losses in the completed machine. In this country they did not seem to be able to build machinery of equal quality with the same silicon-content material as was done in America. Continental steel makers gave much closer guarantees than English makers did, and it would therefore seem that the same quality of material was not being obtained in this country.

Mr. LL. B. ATKINSON was of the opinion that the use of the terms "exponent" and "index" was such that the second paragraph of the author's summary of other investigators' results could be read so as to have two meanings. That was the second time they had listened to considerable argument round a formula which would not fit the case; if Steinmetz's law was not true, he would have liked the author to have said so and to have attempted to evolve a new one that fitted the extended case.

Another speaker said the author seemed to know the B_{max} within 5 per cent., which, he thought, was too optimistic.

Mr. C. E. WEBB, in reply, indicated that the results which he had obtained were not meant to be directly applied by the practical man when designing a machine, but were rather a means of determining the fitness of material to be used. Between the limits of $B = 3{,}000$ or 4,000 and 10,000 the Steinmetz law was true, but he had not succeeded in devising a simple formula that would meet the extended case, nor were they likely to do so. Work was in hand on the determination of losses at audio frequencies.

Economic and Industrial Conditions in France.

Development of Natural Resources.

MR. J. R. CAHILL, Commercial Counsellor to the British Embassy, Paris, has furnished a bulky report,* revised to July, 1925, upon economic and industrial conditions in France, to the Department of Overseas Trade.

The introduction to the report presents a general survey of France's industrial power, and it is stated that her immense war losses have now been made good as regards both industry and agriculture, by a system of immigration from surrounding countries. In addition, every effort has been made to improve methods and instruments of production, and in this connection electricity has had a large share. It is noteworthy that the shortage of agricultural labour has been to a large extent compensated for by rural electrical development. The country's water power is being harnessed as rapidly as circumstances will permit, and many schemes have been accorded State support. As regards the supply of raw materials, the country's position has been improved by the acquisition of the Alsace-Lorraine ore, coal, potash and oil fields, and by the usufruct till 1935 of the Saar coal mines. Side by side with development of the northern coal fields, the production of electrical energy has proceeded at a rapid rate, and an appendix to the report gives a very exhaustive review of the activities of the mining companies, especially from the point of view of the production of electric power.

The war-time extensions of plant in the engineering industries have, in many cases, been converted to the production of peace-time necessaries, and are now engaged in efficient mass production. As regards organisation, the main features in recent years have been the enlargement of the units and the tendency towards combination. In the engineering industries several cases of large-scale consolidation exist; in the electrical industry one company runs nine factories, each engaged in the manufacture of a different series of products, and it has large participations in a score of other manufacturing concerns, as well as in many electricity distribution schemes. Two or three other electrical concerns also possess numerous factories and participate largely in distribution. Electrical material manufacturing concerns have also in some cases made working arrangements with steel producers. In addition to the opening of new works in France itself, extensions have been made by many firms into neighbouring countries.

The Electrical Industry.

The report states that the unbroken prosperity that has attended the French electrical industry since the war has been, and is being, fully maintained. This is attributable not only to railway electrification, and hydro-electric and other power developments, but also to the general advance in the utilisation of electricity in farm, factory, and home. The number of communes in France provided with electricity rose from 2,000 in 1911 to 10,000 in 1923, and to-day the number no doubt reaches 12,000. The development would have been more rapid had not many projects been handicapped by lack of funds. Like several other French industries, the electrical material industry is dominated by a few concerns. In addition, it is closely intertwined with undertakings engaged in the production or distribution of electricity, and it has thus secured a great permanent body of buyers of its products. The Thomson-Houston concern has a capital of 300 millions of francs, and it has special arrangements with the firms of Schneider and Jeumont in connection with the supply of railway electrification requirements. In 1921, with two other large electrical concerns, it formed the Compagnie des Lampes, which embraces several of the chief lamp concerns in France and Spain. It has interests, direct or indirect, with numerous electricity producing works, distribution undertakings, electric traction concerns, &c., and it also has close connections with American interests; in short, it may be said that the electrical industries of France appear to have followed closely the lines of German development in the same industries, the bulk of the undertakings being ranged in a few groups. For many interests these groups, far from being antagonistic, co-operate as regards production (*e.g.*, lamps) or as regards markets (*e.g.*, railway electrification). A long appendix to the report deals in detail with the operations and ramifications of the leading French electrical companies. This is not of a nature which permits abstraction, but it may be said that it shows the close connection between a great number of concerns.

Hydro-Electric Development.

The lack of capital, coupled with the instability of prices, has caused a deferment of many important water power schemes, and thus, whilst the erection of certain high power stations, *e.g.*, Eguzon on the Creuse, Brommat on the Truyère, and Pougny-Chancy on the Rhône, has been proceeded with for various urgent reasons, the larger schemes, *i.e.*, those of the Rhine and the Rhône, which, together, at a cost of six milliard fr., would provide an additional 1,700,000 h.p., have not been started. Accordingly only some 25 per cent. of the total resources has been made use of. The figures given in the report show that the total power in service is 775,210 kW; 339,690 kW was under construction, and 4,003,900 kW was projected. The greatest development has taken place in the south-eastern district of France, in which almost 60 per cent. of the total power is utilised. In Savoy and Provence more than 160 stations are actually in operation, while about a dozen are in course of construction. The Isère is the principal waterway in the district, and 87 stations have been built upon it; 230,000 h.p. has been developed in the south-west, and stations providing a further 100,000 h.p. are under construction. In the central region 79 stations provide more than 100,000 h.p., the Dordogne stations contributing more than one-third of the total. The Paris-Orleans Railway Co. is building three important stations in this region. Little progress was made during 1924 in the north-east and Alsace-Lorraine. Schemes are in hand, but in the meantime deferred, for utilising 800,000 h.p., whereas the total power in service scarcely exceeds 15,000 h.p. at present. Development has also proceeded very slowly in the north and north-west districts, but schemes are in hand for the harnessing of about 100,000 h.p. As regards the tidal power station at Aber-Wrach no progress has been reported during the past year. Full official sanction has been received to the scheme, and there is no doubt that the erection of the station will be undertaken in the near future.

The report also makes mention of the Rhine development, which, in addition to improving navigation, aims at developing about 700,000 h.p. Agreements have been drawn up and certain concessions have been granted. No progress has been made with the definite constitution of the company which was to take in hand the great Rhône scheme. The delay is said to be due to the increased cost of construction, a doubt whether the power will be cheaper than that produced by "thermic" stations, and the difficulty of providing the necessary financial resources.

* Stationery Office, 8s. net.

Railway Electrification.

The present French railway electrification programme of three systems covers about one-third of the French railway mileage, or between 2,000 and 2,300 miles each for the Paris Orleans, the Midi or Southern, and the Paris-Lyons-Mediterranean Railways. The first and second have continued their active work in this respect. The development in 1924 by the Midi Railway included the completion of the stretch of 190 miles from Toulouse to Dax, and, later, the line from Irun through Hendaye and Bayonne to Bordeaux (148 miles) was completed. A number of branches have also been electrified. The work already executed and to be carried out in 1926 will bring the total electrified mileage up to 685, and further progress will be made after this year. Three of the five hydro-electric stations in the Pyrenees are working, the other two being in course of construction. For the eastern section of the Southern Railway two at least of the group of six or seven stations have been completed. The Government has fixed the system for future electrification at 1,500 V d.c. The Paris-Orleans Railway has continued the first part of its programme, *viz.*, the electrification of a stretch of 312 miles from Paris to Brieve, but it appears to be behind the scheduled time. Eguzon station is in service, while the construction of three power stations on the Dordogne river is progressing. The stock delivered during 1925 included five high-power locomotives of the gearless type, developing 2,300 h.p. each; under test one of these attained a speed of 70 m.p.h. So far the Paris-Lyons-Mediterranean Railway is only operating a single section electrically, although its programme provides for the conversion of 2,044 miles. Work is proceeding on the 84-mile line from Culoz to Modane. Of the other main systems the State Railway appears to be the only one engaged in the electrification of any sections, and it is confining itself to the Paris region.

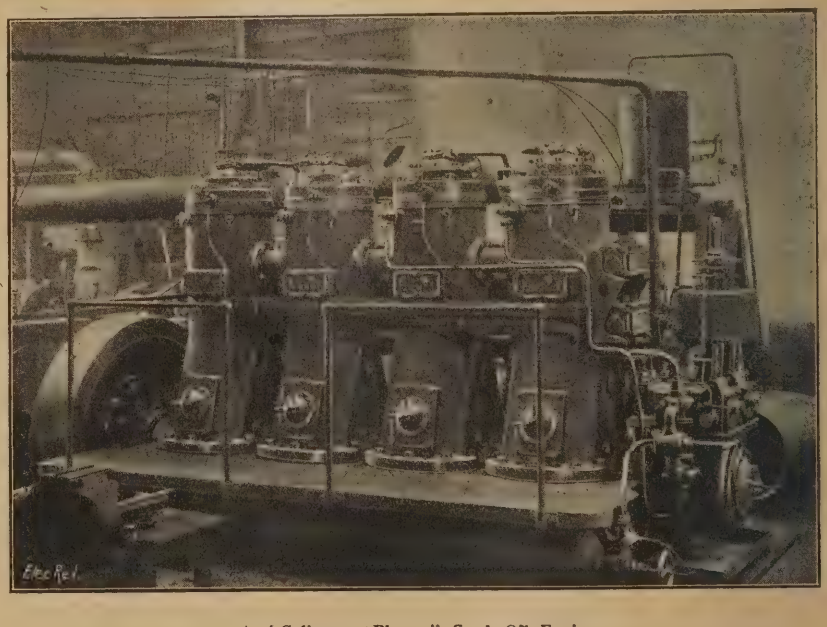
Telegraphs, Telephones and Radio.

The dispatch, by the Belin system, of written messages, introduced by the French Post Office in 1923, has continued. This method of telegraphy may now be employed between Paris and several French towns. The number of telephone subscribers has doubled since 1914, and is now about 600,000. Radio has made very rapid progress in France, which now possesses 40 stations in operation, with as many more in course of building, or planned. The Post Office has erected transmitting stations for telephony at several chief towns, and those at Paris, Strasburg, Lyons, Versailles, Bordeaux, Angers, and Toulon are already working or will be working shortly. The units of this network have an effective radius of 1,000 km. The organisation of the manufacturing industry for radio is very strong; the entire industry is concentrated in fact in the Compagnie Générale de Télégraphie Sans Fil, with a capital of 62.5 million fr., which controls or participates in practically all other French concerns and has large interests in Belgian, Italian, Polish, Jugo-Slavian, Swiss, and Czecho-Slovakian concerns, as well as in Brazil, Argentina, Chile, and the Far East.

The Electro-Chemical Industry.

In an appendix to the report a great amount of information upon this subject is given. The class of products turned out and the provision of the necessary power are dealt with in great detail. Particular mention is made of the Compagnie Produits Chimiques et Electro-Métallurgiques Alais, Froges et Camargue (Péchiney), the predominant concern in the electro-chemical and electro-metallurgical industries. Several large power stations have been erected by this company, but they are proving insufficient for the demands, and further new plants are being constructed. Another company which has erected important water power stations for electrochemical purposes is the Société d'Electro-Chimie, d'Electro-Métallurgie et des Aciéries Electriques d'Ugine, which has seven stations of a total capacity of 32,000 kW.

General.



During 1925, as reported in our pages at the time, a lacuna in French company law was filled by the institution of limited liability companies, analogous in many respects to similar bodies in the United Kingdom. Two Bills were introduced by the Government in July, 1924, to amend the legislation with regard to patents and trade marks. The object of the first Bill was to bring the French patent law into agreement with the International Industrial Property Convention; it extends the period during which patents are valid from 15 to 20 years, and revises the scale of fees. The Bill with regard to trade marks also extends the period of validity from 15 to 20 years. It also recognises and protects collective marks, the legality of which had hitherto only been recognised incidentally. Foreigners may obtain the benefits of these Bills by complying with the same formalities as French citizens

The French State is taking a very active part in the promotion of foreign trade, and since the war it has created a Department of Overseas Trade (modelled in most respects upon the corresponding British Department), which directs the work of 54 commercial attachés in foreign countries and maintains exhibition offices in many cities. The department also works in close collaboration with the important national committee of foreign trade advisers, which is appointed from among the representatives of the export trades in France, and French merchants of standing in foreign countries.

An Improved Crude-Oil Engine.

Some Particulars and Test Results of the "Plenty" Heavy-Oil Engine.

We have received some interesting information concerning the recently re-designed "Plenty" heavy-oil engine, a product of the firm of Messrs. Plenty & Son, Ltd. This engine is of the vertical two-cycle type, employing a crankcase scavenge, and it is made in sizes ranging from 30 to 300 b.h.p. Although the engine is made in one-, two-, three-, four- and six-cylinder units, two sizes of cylinders only are employed, *viz.*—270 mm. bore, 300 mm. stroke; and 335 mm. bore, 390 mm. stroke. The new models, while still retaining the usual features of the previous ones, embody many improvements. The totally water-cooled head is retained and a hot spot in the form of a small plug is utilised for starting; either this may be heated by means of a blow lamp, or an electric starting device may be employed. The starting is effected by means of a pilot jet which impinges upon the hot spot. This is closed off as soon as the engine starts, and the main injector in the top of the head automatically comes into operation. The governing of the engine is effected by altering the length of the fuel pump stroke. The governor and the fuel pump gear are located at the end of the engine, a camshaft being placed across the engine and driven through spiral gears. The cams operate vertical rocking arms which are mounted on a hand operated

A 4-Cylinder "Plenty" Crude-Oil Engine.

eccentric fulcrum shaft, which serves to throw the rocking arms out of action for starting and stopping.

Interposed between the upper end of the rocking arm and the fuel pump plunger is an adjustable tappet. This is made in two halves, one half being free to move endways but not to rotate. This part of the tappet is threaded internally, and into it is screwed the second half. On its exposed periphery teeth are cut which engage with a sliding rack. The latter, which engages with all the tappets on a multi-cylinder unit, is coupled to a centrifugal governor. The governor itself is driven from an extension of the camshaft and is designed to deal with large and sudden variations of load without any external adjustment. The accompanying illustration shows a four-cylinder "Plenty" engine.

Some particulars of tests made on a 200-h.p. "Plenty" engine which was recently supplied to Messrs. Edmundsons, Ltd., for their Newbury power station, add to the interest of the above brief description. The engine was run at full load, 600-lb. brake load, at an average speed of 302 r.p.m. The b.h.p. measured was 201.5 and the fuel consumption for the period under these conditions was 94.5 lb., representing a consumption of 0.468 lb. per b.h.p.-hour. Under three-quarter load the b.h.p. was 152.5, and the fuel used per b.h.p. was 0.515 lb. The consumption at half load was 0.55 lb. per b.h.p. at a measured output of 102 b.h.p.

Developments in Electrically-Driven Centrifugal Machines.

The "Weston" Centrifugal Machine.

THE progress which is being made in this country in the beet-sugar industry emphasises the need for a reliable direct-driven electric centrifugal machine. The firm of Watson, Laidlaw and Co., Ltd., has made a considerable advance in this direction in the design of a machine in which, it is claimed, the electric motor and the centrifugal are each constructed efficiently on its own merits without necessitating the construction of the two elements in one frame. The electric motor is fixed on the framework above the centrifugal which it drives at the upper end of the centrifugal spindle through the medium of a combined flexible coupling and friction pulley, ensuring that the oscillation of the lower machine is not transmitted to the motor itself, thus permitting the rotor and stator air gaps to be kept to a minimum. The coupling and friction pulley combination is so constructed that, by a simple adjustment, the rate of the acceleration of the centrifugal may be varied to suit the particular class of sugar under treatment. The friction pulley enables the motor to run up to speed before the load is applied, thus permitting the use of a motor designed for starting by connection to the supply mains direct. The centrifugal spindle runs in ball bearings and carries a special conoidal rubber buffer. The combination of the ball bearings and this buffer is said to render the machine durable and easy running, with a minimum of oscillation, and with a much greater unbalanced load than has hitherto been possible. The buffer is self-adjusting and hence avoids the tightening of screws as it wears.

Another feature of the machine is a hollow hinged post with which the motor is fitted, enabling it to be raised and turned round, clear of the top of the spindle, without disturbing any of the electrical connections, thereby giving access to the bearings and buffer of the centrifugal spindle. Fig. 1 shows the motor disconnected from the other machine. The former is fitted with a special interlocking switch and brake gear, by means of which the operations of starting, stopping and applying the brake are made by one lever only; the act of applying the brake opens the motor switch so that it is not possible to start the motor when the brake is on or to apply the brake until the supply has been cut off. The motor is totally enclosed and hence protected from the moisture usually prevailing in a sugar-house. Either d.c. or a.c. motors of suitable design can be used with the Weston machine. The position of the motor on the frame at the top of the centrifugal renders unnecessary the provision of special foundations for it. Fig. 2 illustrates a vertical section of an electrically-driven centrifugal machine, and fig. 3 shows a complete unit.

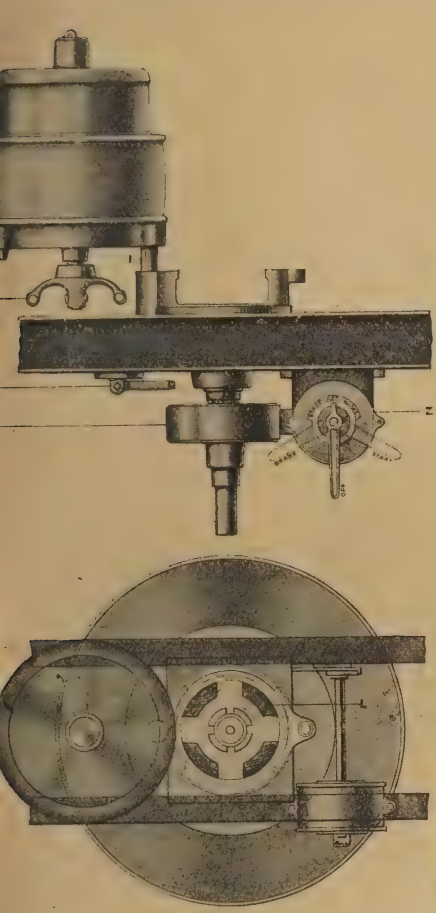


Fig. 1.—Machine with Motor Disconnected.

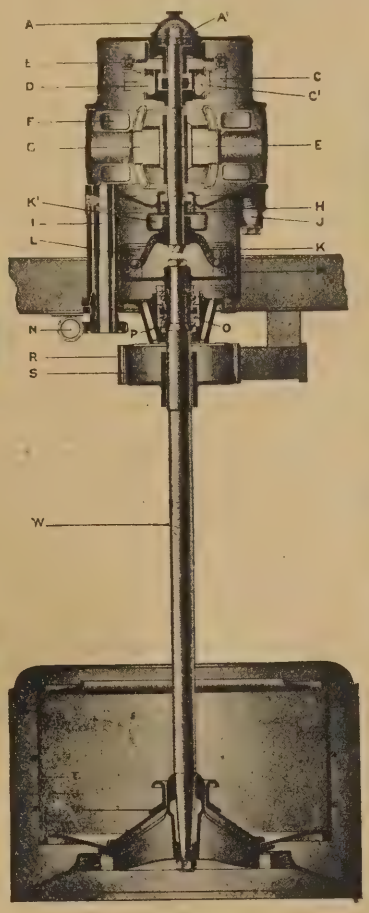

Fig. 2.—Vertical Section.

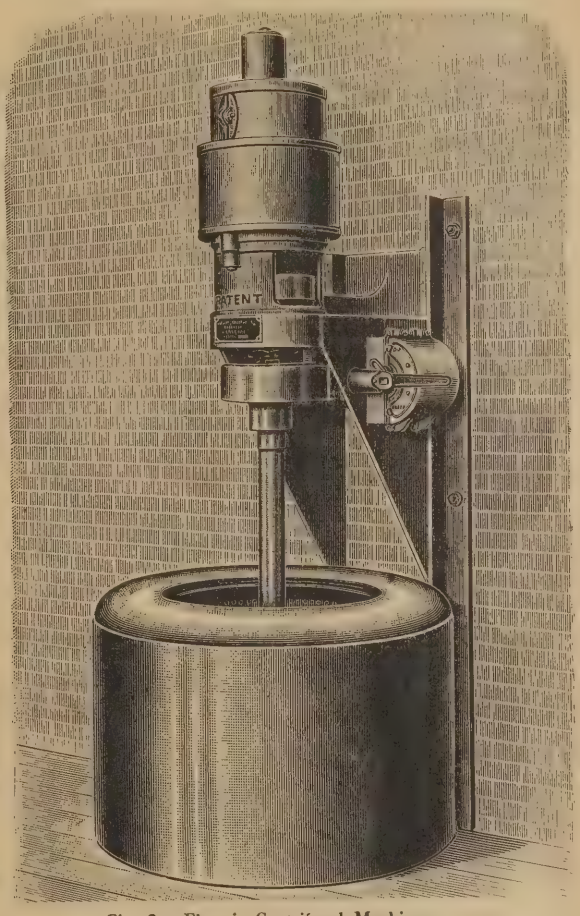

Fig. 3.—Electric Centrifugal Machine.

INDEX TO PARTS.

A, Cover of bearing; A', Top of ball-bearing; B, Brush-holder; C, Brushes; C', Commutator boss nut; D, Commutator; E, Motor spindle; F, Field coils; G, Armature; H, Lower ball-bearing; I, Patent hollow post; J, Motor attachment pin; K, Driver; K', Grease cup; L, Friction shoes; M, Coupling on centrifugal spindle; N, Worm and worm wheel; O, Ball bearing; P, Patent buffer; R, Brake; S, Brake pulley; T, Basket; U, Monitor case; V, Discharge valve; W, Centrifugal spindle; Z, Switch interlocked with brake.

New Electrical Devices, Fittings, and Plant.

(Readers are invited to submit particulars of new or improved devices and apparatus.)

A Speed-Indicating Relay.

According to *Power* a speed-indicating automatic relay, designed primarily for use with small, low-speed, vertical water-wheel generators operating under full automatic or remote supervisory control systems, has recently been placed on the market by the WESTINGHOUSE ELECTRIC & MANUFACTURING CO., U.S.A. It is mounted directly on the end of the rotor shaft, and is enclosed in a sheet-metal housing, having a removable top for inspection. Control energy is supplied through five slip rings, encircling the relay mechanism and insulated from it by a micarta tube. Through these five rings and their corresponding brushes any desired system of remote or automatic control can be connected. The relay operates on the centrifugal principle and assists other relays and contactors in controlling the station. It has three contact points—starting speed, synchronous speed and above-normal cutout-speed. When the generator is started, either automatically or by a distant operator, its increasing speed causes a vertically suspended governor weight, held against spring tension in the relay, to move outward, and as the speed approaches synchronism, contacts are closed, completing a circuit, which operates to throw the generator directly on the line. If, for any reason, conditions of other automatic apparatus are adverse to the generator's being connected to the line, and the breaker is thereby prevented from closing, the generator speed must decrease until the relay contact is established with the initial starting point before it can be started up. This assures safety to both the generator and its main control apparatus by ensuring that all starting operations are performed in proper sequence.

After the generator has been successfully connected to the load, should its speed increase to approximately 40 per cent. above normal, the third contact in the relay would automatic-

ally disconnect the machine, open the field switch and close the gates. The generator's speed must fall to the value of the first contact position before it can be re-energised.

An Improved Duplicator.

We recently witnessed a demonstration of duplicating work on the "Opalograph," an apparatus presenting a new departure in this work, which should prove a useful equipment in the drawing office. The main feature of it is a special opal glass plate to which the original is transferred and from which perfect copies can afterwards be taken, in any colour, of typewriting, handwriting, drawing, &c. The original is prepared in a special ink. A preserving fluid is first applied to the plate, after which the original is pressed to it, face to face, a frame press being provided for this purpose. The plate print is then fixed with a special fixing ink. Copies can then be taken from the print by the usual method. It is claimed that up to 300 copies can be taken from one fixing and that the original can be re-used, fresh preserving fluid and inks being applied. The apparatus is made in sizes to accommodate an original up to a yard square and is marketed by MESSRS. OPALO, LTD., 259, High Holborn, London, W.C.1.

Actino-Therapy Lamps.

The accompanying illustration, fig. 1, is of the "Westminster Junior," one of a range of actino-therapy lamps manufactured by the WESTMINSTER ENGINEERING CO., LTD., Victoria Road, Willesden Junction, N.W.10. It is claimed that the lamp gives a light of great intensity, rich in ultra-violet, luminous

Fig. 1.—Actino-Therapy Lamp.

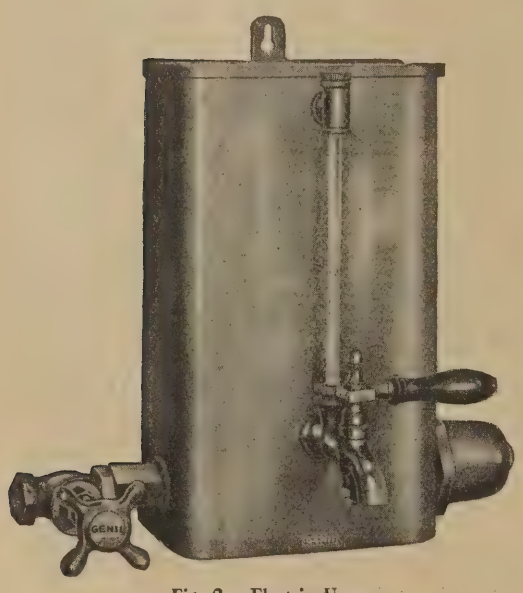

Fig. 2.—Electric Urn.

and heat rays. The proportion of ultra-violet rays can be varied by the use of various electrodes, such as tungsten, &c. It is also claimed that the lamp will burn for three hours without receiving attention. It is supplied with the necessary variable resistances or choking coils for use on d.c. or a.c. circuits as the case may be. Many of the leading hospitals are using "Westminster" lamps and, it is said, excellent results have been obtained in cases of rheumatism, neuritis, sciatica, lumbago, &c.

A New Design of Electric Urns.

The electric urn shown in fig. 2 is one of a new range of such apparatus recently marketed by Messrs. GEORGE NOBBS, LTD., 87-89, Cleveland Street, Fitzroy Square, London, W.1. The "Genii" urns are made in circular or rectangular patterns. The latter are designed for fixing to a wall or bulkhead. They are provided with a threaded boss for a cold-water feed, if required, or they may be filled from the tap by raising the top cover. The heating element consists of a "Genii" immersion heater equipped with a gun-metal terminal box. The urn illustrated has a capacity of 1¼ gallons, but similar designs are made with capacities up to 10 gallons.

An Improved Boiler Meter.

The accompanying illustration, fig. 3, shows the construction of the "Bailey" boiler meter, the latest production of INDUSTRIAL COMBUSTION ENGINEERS, LTD., Astor House, Aldwych, London, W.C.2. It is designed to record the steam-flow, air-flow, and the flue-gas temperature, and also to indicate the furnace draught. The steam-flow is indicated by a red line on a disk chart, which can read either in lb. of steam or as a percentage of the boiler rating. The measure of the flow of air through the furnace is recorded by a blue line which, for the best operation, should coincide with the red steam line; a space between the lines indicates the necessity for attention to the working conditions. The temperature of the flue gases is recorded by a green line which indicates whether or not the heating surface is absorbing the maximum amount of heat. The steam-flow recorder is operated by the differential pressure across an orifice in a Monel metal disk inserted between a pair of flanges in the steam pipe between the boiler and the header. The air flow element employs the same basic principles. The draught pressure drop across the boiler is applied to two bells sealed in oil and suspended from knife edges on a beam. The latter is supported on knife edges and carries a displacing member immersed in mercury. Any increase in the rate of flow of the gases is accompanied by a greater pressure difference which, acting on the bells, produces a motion of the beam, thereby drawing the displacing member out of the mercury reservoir. The member moves until balance is obtained. The temperature measurer is a nitrogen-filled bulb which gives a true average temperature in virtue of its sensitive-bulb section being long enough to extend entirely across the width of the boiler. The measurement of furnace draught, which is indicated on the side scale, is based upon the differential

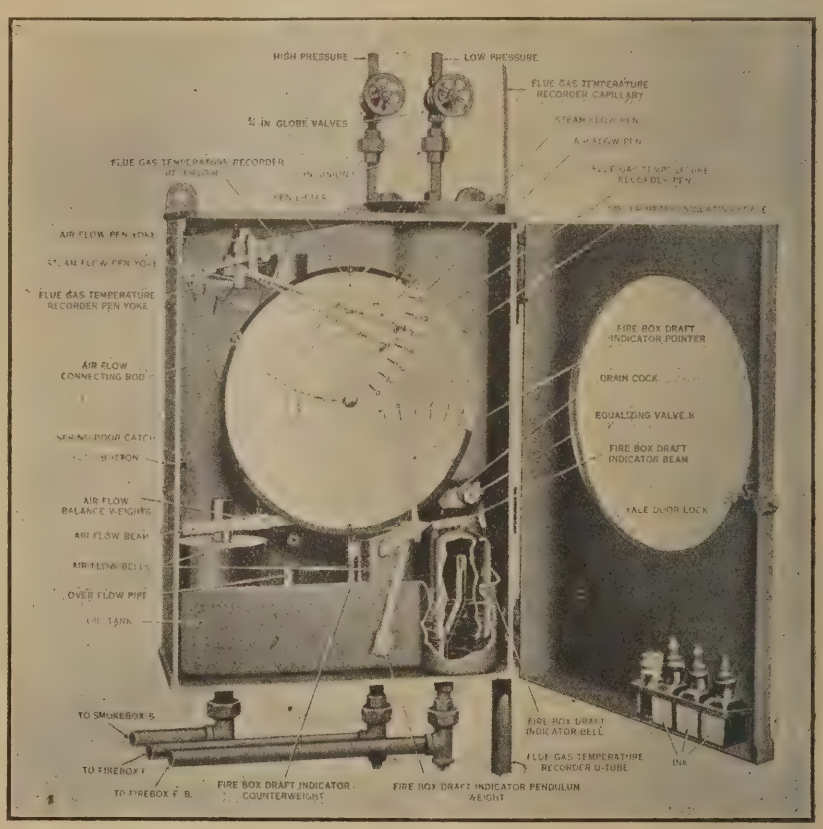

Fig. 3.—Modern Boiler Meter.

draught pressure between the furnace and the uptake to the chimney and is therefore taken across the gas passages of the boiler where the greatest dependable pressure-drop occurs.

A New Electric Safety Lamp.

We are informed that a new electric safety lamp, for use in collieries in which dust and fire damp have to be contended with, has recently been approved by the French Government. It is made by the Société d'Eclairage et d'Applications Electriques, of Paris, and is known as the "L.D.H." It utilises a 2.4-V alkaline battery with plates of iron, cadmium, and nickel, with an electrolyte having a free potassium base. The lamp, which gives a light of 1½ c.p., for 10 hours, is about 10 in. high by 3¾ in. in diameter, and weighs 5¾ lb.

Electric Supply Timepiece.

An interesting development in electric clocks, the "Telechron," has been introduced by the WARREN CLOCK COMPANY of America. For the successful operation of this device an a.c. supply of constant frequency is essential. The propelling force is in the form of a small synchronous motor, to which is suitably geared the clock movement, so that if the frequency of supply does not vary the correct time can be maintained. It is intended that the apparatus should serve as a master clock for any electric-clock installation. The clock is made in many models of cast bronze finished in verde antique.

Parliamentary News.

(By Our Special Parliamentary Reporter.)

Horley Electricity Order.—On December 18th, in the House of Lords, it was reported that the Special Orders Committee had heard evidence from the parties concerned and did not recommend that a further Parliamentary inquiry should take place; but should the Horley and District Electricity Special Order, 1925, be approved, the Committee recommended that it should be approved subject to the omission of Clause 8 and Schedule 5. Lord Donoughmore, the Chairman of Committees, moved that the Report be considered and adopted. He said that both parties were in agreement that no further inquiry was necessary. Certain salient points came up during the hearing before the Special Orders Committee. The first was that the scheme under the Order was still incomplete. A further Order, if not further Orders, would be necessary, and it was understood that they were in progress. It also became quite clear that the promoters of the Order desired to carry out their obligations through the medium of a bulk supply scheme and not through a small separate generating station, and they agreed to the deletion of Clause 8, which authorised them to set up a generating station, and to the deletion also of the schedule relating to it.

The report of the Committee was then adopted.

On December 21st Lord CLARENDON withdrew his opposition to the approval of the Order, stating that the Gas Company did not wish to proceed further with the matter. Lord PLYMOUTH then moved that the Order be approved, subject to the omission of Clause 8 and Schedule 5.

Lord ULLSWATER said that the House of Lords was asked to reverse its decision on the Bill on the *ipse dixit* of the Ministry of Transport, which had never heard the competing parties. The best solution of the whole difficulty would be that neither scheme should go through this session, and that at the beginning of next session both parties should start afresh and get a proper hearing before the tribunal of Parliament. Lord CARSON spoke to the same effect.

Lord DONOUGHMORE said that he felt that the House had no alternative but to accept the proposal of the Ministry of Transport, which, by the Act of 1919, that House had made the responsible agent of Parliament in these matters. In this case the Minister invited the Gas Company to appear at an inquiry, but the company refused because its Bill was then before Parliament, and it preferred to rely on that. He was given to understand that the appeal from the Electricity Commissioners to the Ministry of Transport was a real appeal. It was argued that the Ministry was absolutely independent and judicial, and reviewed the proceedings of the Electricity Commissioners. He hoped that experience might show in future cases that the appeal from the Electricity Commissioners to the Ministry of Transport was a real appeal and not merely a re-submission of the case from one room in an office to another room in the same office. The Gas Company all through these proceedings had been in the position that it could not itself go to the Electricity Commissioners and ask for the Electricity Order—though the Electricity Company could do so—and accordingly it had no remedy but to promote a Bill in Parliament. One difficulty had disappeared; the Act of 1925 for the first time made it unnecessary for a gas company to come to Parliament direct. It could go to the Electricity Commissioners for an Order in the same way as any other authority. He hoped, therefore, that the difficulty would not recur in future cases.

After further debate the Special Order was approved, subject to the deletion of Clause 8 and Schedule 5.

Special Orders relating to Blackburn, Helensburgh, Leyland, North Berwick, Pontypool, West Wilts, and Aylesbury were also approved.

Australian Wireless.—On December 21st, the Prime Minister informed Lord Apsley that the Australian Wireless Company had applied for a licence to operate a radio station in Great Britain for communication with Australia, but it had been informed that, in conformity with the policy adopted by the late Government and confirmed by the present Government, the operation of all the Imperial services in this country would be concentrated in the hands of the Post Office. A contract for the erection of radio stations for communication with Canada, South Africa, India and Australia was made by the Post Office on July 28th, 1924, and approved by resolution of the House of Commons. Those stations were approaching completion, and when they and the corresponding Dominion stations were available, direct radio services would be commenced.

Iron and Steel Trades Safeguarding.—On December 21st, Mr. BALDWIN, replying to questions, said that the application of the iron and steel trades to the Board of Trade for the appointment of a committee under the Safeguarding of Industries procedure was referred to the Committee of Civil Research, and its report had been received by the Cabinet. The Committee had given the subject prolonged and detailed consideration and had heard a large number of witnesses, representing employers and employed, engaged in the iron and steel industries and in allied trades. The evidence revealed a serious situation. The pressure of foreign competition, aided by long hours, low wages, and depreciated currencies, was being severely felt by our manufacturers, and had the Government been able to deal with the iron and steel industries in isolation it might have regarded the case for inquiry as complete. It was clear, however, that the safeguarding of a basic industry of that magnitude would have repercussions of a far wider character which might be held to be in conflict with the Government's declaration in regard to a general tariff. In all the circumstances of the present time the Government had come to the conclusion that the application could not be granted. The Government would keep those industries under close observation with a view to promoting their well-being should any other measures be deemed desirable. It was hoped that the loan for railway development in East Africa which was recently approved would be found helpful, and further similar projects were under consideration.

Wireless Operators in Ships.—On December 21st, Sir B. CHADWICK informed Mr. W. Baker that since November 26th about 24 ships conveying mails to destinations overseas had proceeded to sea without wireless operators, and about 14 others were without a full complement of operators.

Russian Electrical Notes.

Inferior Quality of Manufactures.—The question of the quality of various industrial products is engaging the attention of interested circles in Moscow from the users' point of view. In this connection a representative of the railways states that in 1924-25 23.5 per cent. of the deliveries had to be rejected, including special telephones, insulators, &c. At a conference held in Moscow at the beginning of December complaints were also made concerning the supply by the trusts of defective lamps, many of which had a very short life; unreliable motors, &c.

A High-power Lamp.—A report from Leningrad states that Prof. Hekkel, in co-operation with Prof. Bulgakoff and Prof. Mitkevich, claims to have constructed in an experimental laboratory a new electric lamp having a million candle power without a reflector.

A Large Radio Station.—The Low-Pressure Trust has prepared a scheme for the establishment in Moscow of a 1,000-kW radio station which is intended for direct communication with Europe, Asia and America.

Manufacturing Profits.—The accounts for the year ended September 30th, 1925, of the Central Electrical Trust, which has now been amalgamated with the Leningrad Electrical Machine Trust, have been published. According to the profit and loss account, as published in abstract in the Moscow official newspapers, the year closed with net profits amounting to 2,246,000 roubles. After placing 449,000 roubles to reserve, allocating 337,000 roubles to welfare purposes, paying the directors' fees, totalling 22,000 roubles, and income tax, a net surplus of 1,033,000 roubles remained.

Rural Electrification.—During the current fiscal year (1925-26) the Electric Rural Construction Undertaking intends to proceed with the construction of 44 rural generating stations and the electrification of over 11,000 peasant villages at a total expenditure of 2,300,000 roubles. In accordance with the development of its activity the undertaking proposes to extend the period of credit up to five years and in special cases to seven years, and the credit on the average will amount to from 75 to 80 per cent. of the cost of the installations. The general outlay on the electrification of the villages ranges from 60,000 to 132,000 roubles each.

Development of Production.—The Industrial Section of the State Planning Commission has had under consideration a report by the General Electric Commission concerning the specialisation and development of the electrical manufacturing industry in the year 1925-26, and in connection with the extension programme for the ensuing five years. As a result of the applications already made for deliveries in 1925-26 the report states that the demand of the country can be determined at 170,000,000 pre-war roubles (£17,000,000); the works under the control of the commission are expected to turn out manufactures of the value of 104,000,000 roubles. The Kolchugino cable factory is to produce goods to the extent of 21,000,000 roubles and the remaining, smaller, works products valued at about 5,000,000 roubles. These figures make a total of 130,000,000 roubles, representing the production of the Soviet undertakings. It will, however, be necessary to expend a sum of 15 millions of roubles on repairs and re-equipment and about 6 millions on new manufacturing undertakings in order to bring the total output capacity up to the 104,000,000 roubles in this year in the case of the works under the auspices of the commission, and to a capacity of 140,000,000 roubles in 1928-29.

Tramway Prospects.—A statement has been issued in Moscow concerning the future requirements of the tramways. It is calculated that about 1,500 cars will be needed this year (1925-26). According to information furnished by the General Metal Commission, the cost of constructing cars at Soviet works is much higher than the cost of German cars. The output capacity of the Russian works is put at 1,100 cars per annum. The State Planning Commission, before which the statement was placed, has fixed the number of motor cars to be ordered this year at 1,000, with 600 reserve motors. As

supplementary equipment will have to be obtained from abroad, the commission has expressed the desirability of limiting the needs in this respect to from 5,000,000 to 6,000,000 roubles. In connection with this question it is stated that the Moscow tramways earned gross receipts of 33,200,000 roubles in 1924-25, the expenditure having been 23,200,000 roubles. Out of the profits of 10,000,000 roubles the sum of 5,000,000 roubles has been assigned to the acquisition of new cars, &c.

A Breakdown at the Kaschir Station.—It is reported that in November a breakdown occurred in a 7,500-kW turbo-generator at the Kaschir station owing to an unknown cause. A reserve machine was at once brought into use. The repairs were expected to occupy three weeks. No interruption is stated to have taken place in the supply system of Moscow as a consequence of the defect.

The Five Years' Electrification Scheme.—Some particulars have been published concerning the position of the scheme of electrification of Russia which was originally prepared five years ago. It is stated that out of the 30 regional stations contemplated 14 have been built or are in course of construction; projects have been prepared in regard to three other stations, while 13 have not been commenced. The total capacity of the works built, in course of establishment, and projected, amounts to 712,500 kW, and the stations not yet begun represent a further 1,037,500 kW. The non-completion of the original programme is claimed to have been compensated for by the construction of two new regional stations which were not included in the former plan, namely, the Semo-Avchalsky and the Lyaninsky stations, and by some other stations of local importance. As to the conversion of main railways to electric traction, as was projected in the original scheme, it is admitted that this has not yet been commenced, as sufficient allowance had not been made for the radical reconstruction which was necessary before electrification could be proceeded with. At present the only work of electrification of railways is being undertaken in connection with the lines in Baku and the suburbs of Moscow. The total capacity of the stations of public importance and of those at industrial works which are considered as "regional" stations amounts to 480,400 kW.

Legal.

Theft of Electricity.

ON December 23rd, at Cardiff, Alfred Warren was prosecuted for fraudulently abstracting electricity from the Corporation's mains. It was stated in evidence that the defendant had removed the seals from the cut-outs in premises in Stuart Street, and the meter leads had been tampered with so that current did not pass through the meter. The defendant stated that he was engaged to install some lights in the house, and he found that the fuse box was not sealed. He did nothing to alter the fuse boxes. He admitted that he had not informed the Electricity Department that the installation was ready for inspection.

A fine of £3, or in default one month's imprisonment, was imposed.

Ridley v. J. Gledson & Co.

WE are informed that on December 17th, at Middlesbrough County Court, Messrs. J. Gledson & Co., electrical wholesalers, Newcastle, appeared in answer to a summons issued by Mr. C. E. Ridley, of Middlesbrough, to obtain payment of 5s. 6d., being the amount claimed for a sample. Messrs. Gledson & Co. stated that they had not ordered the goods, which were lying at sender's risk in their stores. The Judge, in dismissing the case with costs against plaintiff, stated that the sender's contention that the goods should have been returned could not be upheld.

Trade-mark Applications.

THE following are among the recent applications for British trade marks. Objections against any of the proposed marks may be entered within one month from December 23rd. In the case of foreign applications, the names and addresses of the British representatives are also given :—

Krone. No. 455,460. Class 4; and Electrax. No. 555,451. Class 8. Electric carbons.—The firm of C. Conradty, 9, Spittlertorgraben, Nuremburg. (S. Sokal, 1, Great James Street, Bedford Row, W.C.1.)

Desulphate. No. 463,727. Class 8. Accumulators and batteries.—T. W. Underwood, 45, Furneaux Avenue, Knights Hill, West Norwood, S.E.27.

Agelindus. No. 403,257. Class 8. Philosophical and scientific instruments and apparatus for useful purposes.—Gesellschaft für Electricitäts Industrie, 8, Motzstrasse, Berlin, W.30. (Cruikshank & Fairweather, 65-66, Chancery Lane, W.C.2.)

The Akk-e-Mmar, A.M.R. (lettering and design). No. 462,289. Class 8. Rectifiers for alternating current.—Auto-Mechanical Rectifiers, Ltd., 91, Tabernacle Street, E.C.2.

Faithful Service (lettering and design). No. 463,252. Class 8. Instruments and apparatus and parts thereof for use in radio-telephony and telegraphy, electric batteries, &c.—H. P. Taylor, trading as Paul Taylor, 147, Stamford Road, Kettering.

The Advance (lettering and design). No. 463,729. Class 8. Instruments, apparatus and parts thereof for use in radio-telephony.—Equipments, Ltd., 26-27, Avenue Chambers, Southampton Row, W.C.1.

Transadyne. No. 464,401. All goods in class 8.—Neutron, Ltd., 3, Warwick Court, Gray's Inn, W.C.1.

Arga. No. 463,335. Class 13. Electric incandescent lamps.—Naamlooze Vennootschap Philips Gloielampenfabricken, Eindhoven, Holland. (Boult, Wade & Tennant, 112, Hatton Garden, E.C.1.)

Pigellite. No. 464,325. Class 40. Copper wire covered with india-rubber or gutta-percha.—Pirelli-General Cable Works, Ltd.

Published Specifications.

Compiled expressly for this journal by Patent Agents.
The name of the applicant's patent agent, if any, will be found on the printed specification.
The numbers in parentheses are those under which the specifications will be printed and abridged, and all subsequent proceedings will be taken.

The

Electrical Review

VOL. XCVIII. JANUARY 8, 1926. No. 2,511.

THE OLDEST ELECTRICAL PAPER. ESTABLISHED 1872.

Published every FRIDAY, Price 6d.

Chairman: H. ALABASTER.

Technical Editor: A. H. ALLEN, M.I.E.E. *Joint Managing Directors:* G. H. ALABASTER. E. A. GATEHOUSE, M.I.E.E. A.M.INST.C.E. *Commercial Editor:* A. H. BRIDGE.

Manager and Secretary: E. S. MIDDLETON.

OFFICE: 4, LUDGATE HILL, LONDON, E.C.4.

Telegraphic Address: "AGEEKAY, CENT., LONDON," Code, A B C. Telephone No.: Central 7072 (Three Lines).

The "Electrical Review" is the recognised medium of the Electrical Trades, and has by far the Largest Circulation of any Electrical Industrial Paper in Great Britain.

SUBSCRIPTION RATES, Postage Free: United Kingdom, £1 14s. 8d.; Canada, £1 12s. 6d.; Colonial and Foreign, £2 1s. 6d. per annum Cheques and Postal Orders (on Chief Office, London) to be made payable to THE ELECTRICAL REVIEW, LIMITED, and crossed "Midland Bank, Newgate Street Branch."

Materials for the Electrical Industry.

DURING the year just completed the Copper market has, as usual, been subject to varying moods of optimism and despair, but throughout the period the price ruled moderate, values having fluctuated between about £59 and £68 per ton for cash standard, and £62 10s. and £72 for electrolytic, the quotation at the end of December being about £59 15s. for the former and £66 for the latter. The development of large low-cost properties in South America and in Africa, and improved metallurgical processes generally, resulted in output being maintained at a high rate. During the first eleven months of 1925 the production of the leading countries totalled 1,409,000 short tons, compared with 1,459,500 short tons in the complete year 1924. On the other hand, consumption has been very large, as can be imagined, considering the world tendency towards electrification of transport and industry. The importance of the wire-drawing trade is illustrated by the fact that of the total deliveries of copper in America for domestic and foreign markets, no less than 64 per cent. was in the form of wirebars. The leading feature of the market has been the remarkably sustained consumption in America, but Europe also took substantial quantities, Germany's imports, for instance, in January-October, being 192,000 metric tons, against 80,000 metric tons in the same period of 1924. The stocks of refined copper in America fell from 136,000 short tons on December 31st, 1924, to 68,000 tons at the end of November last (the latest figures available), the combined stocks of refined and rough copper showing a loss of 58,000 tons. Latterly, the chief factor has been the depression on the Continent, especially in Germany, where lack of capital and restricted credit facilities have had a very adverse effect, the financial unsettlement in France also being a disturbing element. The copper

market, therefore, closes the year in circumstances not of the happiest, but with hope lingering that 1926 will see improved economic conditions in Europe, accompanied by an enlargement of consumption.

Tin enjoyed active and prosperous conditions, cash standard fluctuating between £229 and £290 per ton, the quotation at the end of the year being at the top. The outstanding feature has been the large consumption, chiefly in America. Output has not responded as might have been expected to the highly remunerative price, mainly because new deposits of importance have not been discovered or brought into production, although new mining ventures are constantly being initiated, which may have effect later on. No doubt there was some increase, on balance, in 1925, but nevertheless consumption exceeded output and the visible supplies of metal were depleted by some 6,000 tons. The outlook depends largely on whether or not consumption in the United States will be maintained. If it is, higher prices will be inevitable.

The consumption of Spelter was so substantial during 1925 that for a long time the Continent was able to consume the bulk of its output, thus necessitating substantial purchases in America to fulfil the requirements of British consumers. The quantities thus absorbed, together with those used in the United States, resulted in a very sharp reduction in the American stocks, which were brought down from over 21,000 short tons at the beginning of the year to about 7,000 tons at the end of November. Latterly, conditions have not been quite so favourable, European consumption having been affected adversely by the economic troubles of Germany. Hence Continental spelter has been available more freely for our market, and values here declined, creating a considerable gap between price levels in the United States and London. The future rests largely on the development of affairs in Germany. During 1925 prompt metal fluctuated between £40 12s. 6d. and £33 10s., the quotation at December 31st being £38 12s. 6d.

On the whole 1925 proved a good year for the Lead industry, production having shown a substantial increase over last year, and having been probably something like 25 per cent. larger than in 1913. This state of affairs arose to a large extent from the remarkable activity in the electrical trades throughout the world, cable-makers having been uninterruptedly busy during the whole year. The demand for storage batteries was also maintained at a very high rate, while the building trade accounted for an excellent consumption of manufactured products. Somewhat strangely, the greatest activity in the market was seen during the summer months, while the shipping strike which ensued in the autumn and the long drawn-out struggle, resulting in delayed arrivals of badly-wanted metal, complicated the position here, involving, as it did, a shortage of supplies. This trouble having passed, the closing weeks of the year saw rather quieter conditions, with some slackening of demand here, and a setback in Continental business, due to the financial and political difficulties which have been rife there. Nevertheless, the outlook is not discouraging, for substantial buying has to be done by consumers here, and an improving tendency should be noticeable in Continental business.

In Rubber the past year was one of outstanding interest, partly owing to the very wide range of prices seen—from 1s. 4¾d. to 4s. 8d. per lb.— and partly because it marked the complete recovery of estates in Malaya and Ceylon from the disastrous effects of the post-war slump. The Stevenson restriction scheme worked uninterruptedly throughout the year, the exportable quota rising from 50 per cent. of standard in January, to 85 per cent. in December, while the Government has already announced that an extra release will be made at the beginning of February, 1926, bringing the exportable quota up to 100 per cent. of the standard. The stocks showed a steady reduction during the first six months of 1925, and the London reserves for a time stood at below 5,000 tons. American consumers were partly to blame for the price movements, for they chose to depress values when even a slight advance would have ensured larger supplies of rubber, and the growing popularity of the balloon tire and the record automobile production forced manufacturers to buy heavily later on at largely increased prices. The higher figures ultimately caused the release of more rubber, and during the latter part of the year the stringency of supplies was not quite so acute. Production during 1926 may possibly overtake consumption, and stocks may recover to more comfortable proportions, especially if the threats from America of the use of very largely increased quantities of reclaimed rubber prove to have a really substantial foundation.

The Electric Railway Outlook.

WHILST a good many orders for electric locomotives and other railway plant are, fortunately, being carried out by British manufacturers for important railways in the Dominions, the optimistic allusions of the Minister of Transport and of the Electricity Commissioners to the "coming" electrification of our main-line railways at home have been considerably discounted by the recent utterances of railway managers and directors, who are not yet convinced that the advantages to be derived from electrification are sufficient to justify the outlay involved. It may be alleged that the finances of the railway companies are not in such a prosperous condition that the directors can justifiably embark on any costly enterprise which does not offer the sure prospect of an immediate return; but they are able to spend large sums on new locomotives and rolling stock, and it is to be regretted that the bulk of this expenditure tends to perpetuate the existing system of traction. With our comparatively short hauls and dense traffic, the conditions are favourable to electrification, and the high price of coal affords an additional incentive. The plea that the adoption of electric traction would deprive the railways of a most profitable source of revenue—the haulage of coal—does not apply to their own case, for they themselves have to pay for the transport of the coal that they use for locomotion; moreover, they pay a large portion of the carriage twice, as they have to carry the coal whilst consuming it.

There is no doubt that large savings in fuel and maintenance costs would be effected by electrification, and the outstanding question is whether the additional capital charges would be covered by these economies and by the increase in the traffic which usually follows electrification. So far as we know, detailed estimates such as the railway managers must have had before them have not been made public; it would be interesting if they were revealed. The newly electrified sections of the Southern Railway have now been in operation for five months, but it is not usual for the railway companies to publish the traffic returns separately for steam and electrical operation; such classified returns would be welcomed.

X-Ray Apparatus.

LAST month the General Committee of the Coventry and Warwickshire Hospital unanimously decided to purchase some German X-ray equipment for the purpose of modernising certain British apparatus which has been in use for 15 years. Apart from the regrettable fact that a body entrusted with public money should be spending it on foreign plant at a time such as the

present, it is surprising that certain committee-men allowed themselves to make the statements with which they are credited in the local and other Press. The Chairman, while admitting that there was no question but that English apparatus could be obtained to do the work just as well, is reported to have said that it was very much heavier, more difficult to manipulate, and about three times more expensive.

Such statements as these are too serious to be ignored, for they convey a misleading impression of the facts and cannot be justified. How does the weight of such apparatus adversely influence its efficiency? Easy manipulation depends entirely on the dexterity of the operator, and this is the first time that we have heard of British outfits being criticised in this connection.

As regards price, it would be interesting to know by what method of calculation the figures quoted by the Committee were arrived at, for couches and screening stands are obtainable in the British market at very much lower prices than those instanced by the Committee. Moreover, no comparison is valid unless it is made on a fair basis, and as is pointed out in our "Correspondence" columns, it should not be forgotten that English manufacturers design their appliances with a view to securing the approval of the X-Ray and Radium Protection Committee of the National Physical Laboratory with respect to the adequate protection of both the patients under treatment and the operators of the equipment. In this respect British apparatus is acknowledged to be far superior, although compliance with the regulations necessarily adds somewhat to its weight and cost, and it is obviously unfair to disregard these facts when comparing it with plant made in a country where safeguards of the same standard are not demanded, or even considered necessary.

We know of no evidence that will justify the charge that English firms are conservative and "well behind Germans and Americans" in this line. This contention is indeed strange in view of the fact that practically the whole of the X-ray equipment in the great London hospitals and other leading institutions in this country is entirely British. Further, as was reported last week, Swedish opinion seems to be just the reverse. An international syndicate agreement restricts the Swedes to the purchase of European apparatus, but they have complained for some time past that certain Röntgen accessories, particularly tubes, are not obtainable in Europe in the same improved form as those made elsewhere. Hence, Swedish medical men have petitioned their Government for the State expropriation of the patents concerned in order that they may be able to import other than German manufactures.

It is a pity that ill-informed officials, by indulging in discussion such as that which took place at Coventry, should be able to do so much harm to an important and enterprising industry.

French Industrial Progress.

THE remarkable rate at which the use of electricity is growing in France was commented upon in the report by Mr. J. R. Cahill, which was reviewed in our last issue. He states that the *per capita* consumption of electricity is advancing at the rate of 20 per cent. yearly, and the electrical industry is kept busy meeting the growing demand. Railway and rural electrification, and the harnessing of water power, are all contributing to the industry's order book, while the domestic market is considered of almost equal importance. Electricity in mining, metallurgy and chemical production is another great source of revenue to the French electrical industry. It might be thought that a goodly share of this work would fall to foreigners, but it appears that the home industry has grown to such a stage of competency that the call for foreign goods is very small. The great electrical firms, by judicious association with large groups which employ electrical machinery, have secured to themselves permanent buyers of their products, reducing the chance of the foreigner to obtain orders to a minimum. It is calculated that a total of 2,000 millions of francs is invested in the electrical manufacturing industry, while it employs 70,000 persons. The electricity supply industry has a capitalisation of 4,500 millions of francs, and gives employment to over 25,000 workmen.

It is not to be wondered at that our exports of machinery to France have been gradually declining since 1921. In that year they were 59,037 metric tons, while in 1924 they were less than half of this. In 1913 the quantity was 47,731 metric tons. As regards electrical imports, it is shown that although there was an increase in the nominal value in 1924, there was actually a decrease—the depreciation of the franc causing a false impression. Exports of electrical goods from France showed a remarkable increase in 1924, the total weight being 23,600 tons, as compared with 16,800 tons in 1923, and 10,100 tons in 1913.

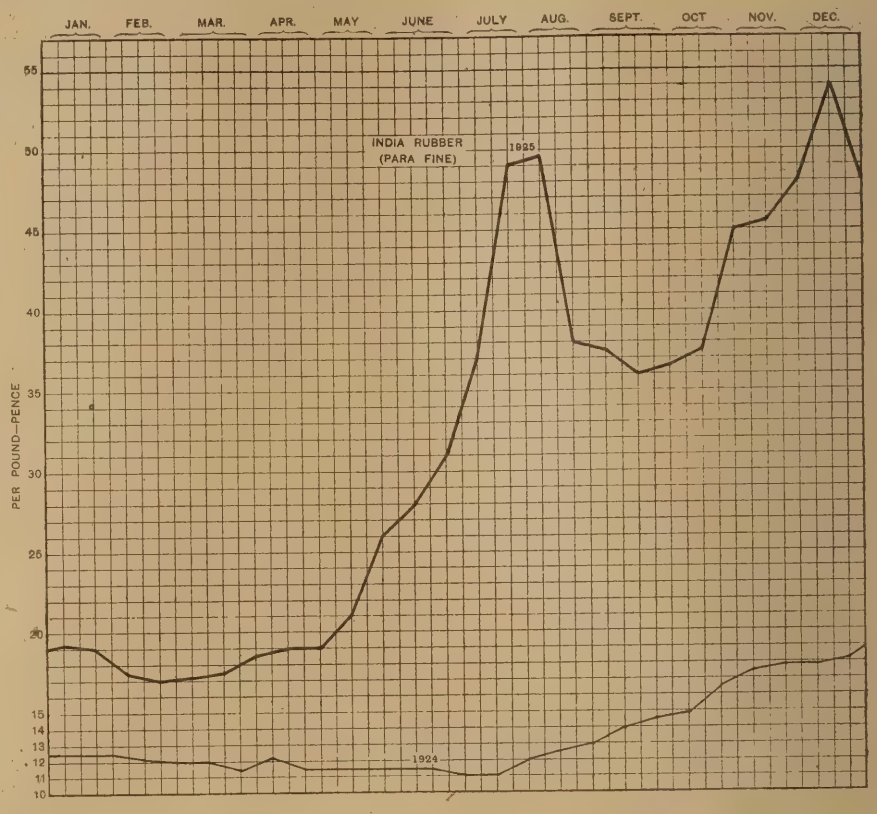
This information merely confirms the already well-known fact that as a market for general electrical goods, France is not likely to improve, being well able to look after herself in this respect.

India as an Electrical Market.

IN this issue we review a report by Mr. T. M. Ainscough, C.B.E., the Senior Trade Commissioner in India. It is pleasing to note that conditions are now more settled, and the financial position of the Government has been strengthened by improved trade. The prosperity of the country was, however, not reflected in the import figures, the explanation appearing to be that the percentage increase in the prices received by the Indian producer was not so great as that in the prices of imported goods. So far as the imports of machinery were concerned, during the period under review the position of British suppliers improved at the expense of the Swedes and Americans, although the total trade was smaller. In the case of imported electrical apparatus, there was also a decrease in the total and in the British share, while that of Germany showed an appreciable increase.

It would appear that a number of excellent opportunities for British electrical manufacturers will occur in the near future, as several important public works are being undertaken, one of the chief of which is the Punjab hydro-electric scheme. Railway electrification is also likely to be greatly extended, and Mr. Ainscough says that the excellence of the plant and materials already supplied for this type of work by British manufacturers has given the latter a good hold on the market.

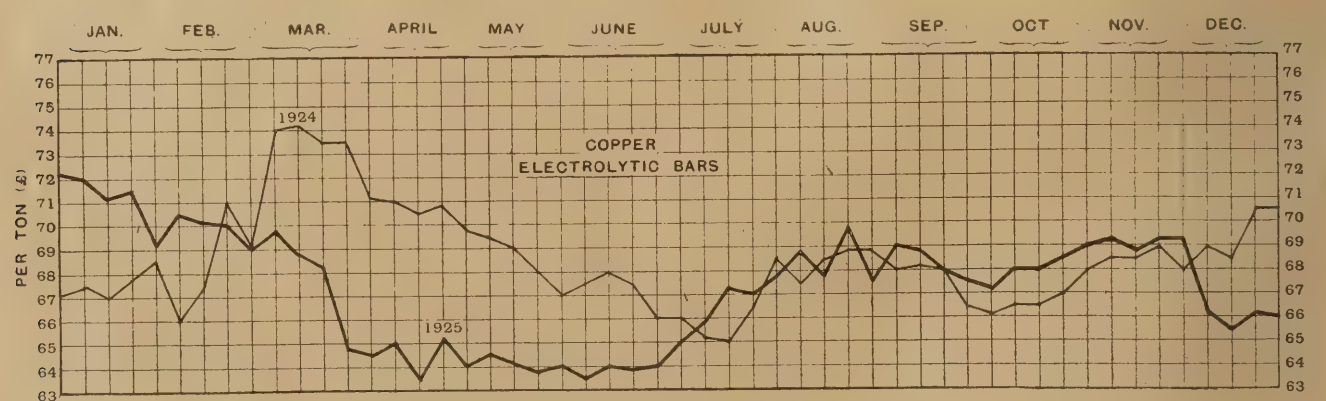
Electricity on Motor-Ships.



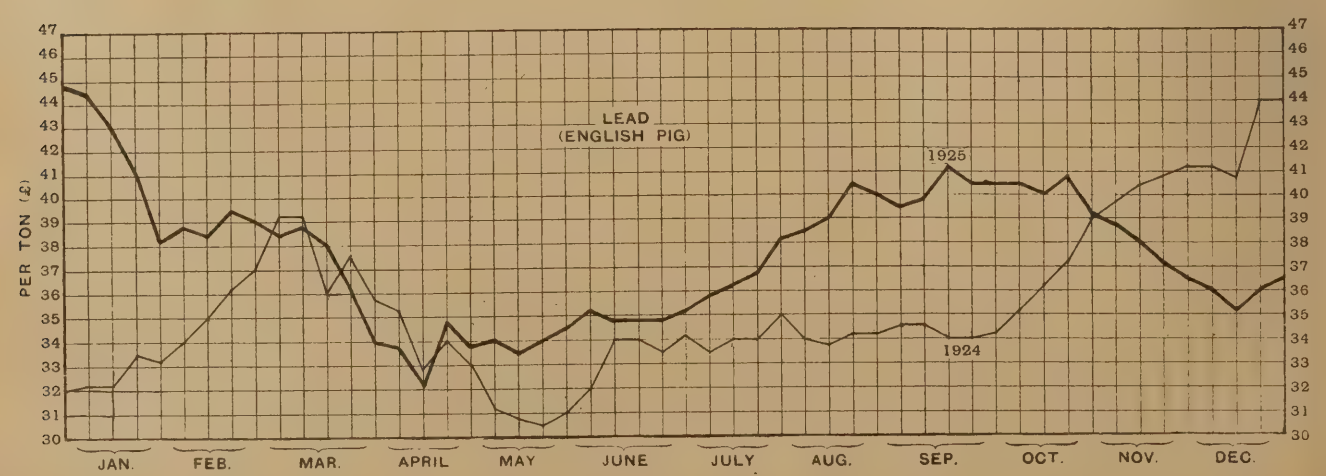
ALTHOUGH the advent of the all-electric ship may not be possible until the key is found to unlock atomic energy, substantial progress is being made in that direction. It is true that electric propulsion is not being adopted on British ships, but it is making headway abroad, and we hope to see it come into its own in the fullness of time. Meanwhile, it is gratifying to observe that the use of electricity for a wide range of applications is rapidly gaining popularity, particularly on board ships propelled by oil engines; as Mr. A. Regnauld shows elsewhere in this issue, not only is all the auxiliary machinery driven by electric motors, but also electricity is used for lighting, heating and cooking in some cases, and for ministering to the comfort of passengers and crew in a variety of ways, these services involving the consumption of about 15 per cent. of the total quantity of oil burnt. Besides giving employment to a large number of workpeople on shore, the development of the electrical department on board ship necessitates the employment of electricians, and it is a significant event that an engineer writes to *The Times* of December 31st drawing attention to the increasing importance of the electrician at sea. He states that the Board of Trade refuses to permit an electrician to rise above the rank of third engineer, and will not grant him a "ticket." Evidently the time is at hand when careful consideration should be given to these questions.

Copper, Lead and Rubber in 1925.

IN accordance with our usual practice, we reproduce herewith curves showing the course of copper, lead, and rubber prices during the past two years.



Generally speaking, the price of copper was lower in 1925 as compared with the preceding year, although it commenced the year £5 per ton higher. Upon the point representing the last week in February, the curves met, but from that date up to July there was a considerable difference, the price falling twice during that period of 1925 to £63 10s. per ton, whereas the lowest point reached in 1924 was £65. From July to the end of November the curves kept well together, but towards the close of the year another divergence commenced, and the end of December saw the reverse of the opening position.



The level of lead prices during 1925 was generally above that of 1924. A very large difference at the beginning of the year soon dwindled until in early March the curves crossed and remained fairly closely together right up to July, except that the 1925 curve did not fall to the depth experienced in May, 1924. From July to the end of October the curves gradually separated and then returned. In the closing months of the year the price dropped fairly sharply in contrast to a steady rise at the end of 1924, and lead in the same way as copper finished considerably lower in price than it started.

The past year was a memorable one for rubber, and our curve (which is based upon the figures quoted in our fortnightly table for "para fine") showing the trend of its price during 1925 is in marked contrast to the comparatively uninteresting graph for the preceding year (or that for 1923). The rising tendency which set in towards the end of 1924 was slightly checked in the earlier part of last year. Rubber soon recovered, however, and with phenomenal resiliency sprang upwards to a very high peak in July-August. Thereafter a sharp relapse was experienced, but after hovering around 3s. per lb. for a few weeks there was a fresh upward movement, which took the price to 4s. 6d., followed by another relapse to 4s. 1d. at the close of the year.

On Monday last the highest prices paid for crude rubber were:—Spot 3s. 10d., January 3s. 9¼d., January-March 3s. 8¼d., and April-June 3s. 4½d. An increase in London stocks of crude rubber of 586 tons for the week, brought up the total to 6,129 tons against 29,206 tons a year ago.

Martyrs of Science.

By Dr. W. S. HEDLEY.

THERE has recently been announced the death of Mr. R. G. Blackall from exposure to X-rays, and reference has at the same time been made to the case of Mr. Wilson and Mr. Harnack, the former of whom lost his life and the latter lost both arms from the same cause. As a fellow-worker with the last two, though not a sharer in their heroism, may I be permitted to add a word of sympathy and appreciation and at the same time make comment upon the deplorable fact that we are to-day mourning a recent death due to a danger of which the cause was known, and known to be preventable, well nigh thirty years ago?

Let us get back to dates: Discovery of X-rays, November 8th, 1895. Taking Mr. Campbell Swinton's Radiograph of a hand (ELECTRICAL REVIEW, January 24th, 1896), as the beginning of X-ray work in England, and taking the report of Marcuse (Deut. Med. Work, July 2nd of the same year) as the earliest or amongst the earliest reports of X-ray dermatitis, there was a short period of about five months when the "New Photography" was practised in unsuspecting ignorance of the dangers that lay behind it—heroism had no place here. The danger becoming known, protective measures were at once devised. I find that I wrote in the ELECTRICAL REVIEW, November 12th, of the following year of "Ulcers of a very painful character, and slow to heal, following exposure to the action of the focus tube." Then follows a reference to the necessity for protective measures and suggestions of aluminium plates and envelopment of the tube in black cloth as worth trying against any ill-effects of the "soft" tubes of those days. And other devices kept pace with the increasing power and penetration of the tubes, until to-day we have the elaboration of the "radiographic couch" with its all-metal tube box lined with sheet lead, and its easily-moved protective screens and diaphragms to limit the field of action of the rays. Some of us have even known something of a ray-proof room for the safety of neighbours. Such devices, with our ever-growing knowledge of the output of the X-ray tube, ought to make serious X-ray accidents almost things of the past. It is further to be remembered that by their physical, chemical, and biological effects, the intensity of these rays can be measured, their quality tested by other means, and not least in importance is the process of so-called filtration by which unwanted rays may be filtered out and the operator left in possession of a "bundle" composed chiefly of rays exactly suitable for the work in hand.* May it be assumed—it is a large assumption—that every medical man who handles these rays for treatment upon the living body (and no others should handle them for this purpose) has a fair knowledge of the X-ray tube and the rays it emits, an instructed experience of "dosage" and its measurement by the "erythema unit,"† a practicable experience of the details of its application to the body, an appreciation of its possible dangers, and does he carry out his procedure with the same sense of responsibility that he would bring to bear upon a serious surgical operation? Has he worked in the X-ray room of his hospital? Has he attended post-graduate lectures? Finally, seeing that it is impossible to include such work in an already crowded curriculum, is he in possession of any certificate from a duly authorised body, of his fitness to practise this speciality?

So long as the human factor remains, there must, of course, be accidents, but by adopting such measures as the above it is reasonable to hope and expect that they will be minimised. My experience is that it is the demonstrator who all day long is exhibiting his ray-pierced hand to the crowd, that suffers most. I have a recollection of the early days that it was a showman in the streets of Toronto who became one of the earliest victims of X-ray dermatitis. Those early X-ray days bring back a crowd of X-ray memories. The X-ray arrived in England a comparatively unknown stranger, and was not always received with the warmth and welcome that its potentialities and importance deserved. I was in charge of the Electrical Department of the London Hospital at that time, and it devolved upon me to establish an X-ray section. I looked in vain for a home to lodge it in. Beginning with the house governor, I interviewed the whole staff and, without exception, they declared that, owing to increase of work, the hospital was already crowded to its doors, and this was only too true. At last I approached the chairman. He could only say the same, but I understood him to promise that he would "build one." In view of the possibility that he was getting a little playful at my expense, I retired. (I had good reason to change my estimate of that chairman when shortly afterwards I found myself in spacious and well-equipped quarters in a new building.)

Passing on from that interview, my way lay through one of the wards, and I heard in the corridor the rustle of a silk dress; I noticed that all the patients looked pleased and every member of the staff, male and female, sprang "to attention." It was my first interview with the then matron, Miss Luckes, of revered memory—I was not long in explaining my troubles—"Could she do anything about it?"—a gentle shake of the head plainly answered "No!" I then suggested that I had noticed a large light cupboard—another shake of the head. "Oh, that is the jam cupboard." I then hinted that perhaps other accommodation could be found for the jam—or that "I had noticed several convalescent patients who no doubt would see to its disposal, or, (hesitatingly) the jam might perhaps be left on the top shelves"—another shake of the head, this time of greater amplitude and intensity. "Oh, that would *never* do"—and she was gone. But I thought I saw a gleam of helpfulness in her eye, and I was not altogether surprised when on the next day I saw that that "cupboard was bare" and its door standing invitingly open. I was not slow to avail myself of the invitation, and lost no time in installing the scanty X-ray equipment of that day, *viz.*, my Apps 10-in. sparking coil, and accumulator to "drive" it, a "hard" tube, a "medium," and a "soft" one, a tube stand and a flourescent screen. Such was the genesis of the X-ray Department of the London Hospital.

Dr. Hedley was the writer of an article on "Twenty-five Years' Progress in Electro-Therapeutics," published in the Special Issue of the ELECTRICAL REVIEW celebrating the 25th anniversary of the Journal (November 12th, 1897).

Dr. Hedley, M.D.Ed., M.R.C.S., Eng., who is now living in retirement at Shorts Lodge, Liphook, Hants., was at one time Physician-in-Charge of the Electro-Therapeutic Department of the London Hospital, also, Brig.-Surg. Army. His writings include:—"Therapeutic - Electricity"; "Hydro-Electric Methods in Medicine"; "Current from the Main"; "Scope and Value of Electricity in Medicine," *Lancet*, 1896; "Insomnia in Neurasthenia," Ib. 1893; "Electric Radiant Heat Apparatus," Ib.

* It is not possible by filtration to make X-rays homogeneous, but when by the use of (say) a 0.5-mm. copper filter a certain degree of homogeneousness is obtained, we say the rays have become "homogeneous for biological purposes."

† This is the recognised unit for the biological effects of X-rays, but it recognises only surface effects and does not take account of the intensity falling on structures below the skin, therefore the quantimeter (chemical or electric) which determines the dose at various depths and during the entire exposure must be used.

Motor Coaches for Swiss Railways.

A New Type of One-Man Rail Car.

To meet the requirements of its service during periods when traffic is not heavy, the Lötschberg Railway Co., which operates the Berne-Lötschberg-Simplon section of the Swiss Railways, has recently put in operation two electric motor coaches of somewhat unusual design. The vehicles were built to meet certain special requirements, among which was one that the motors of the vehicles must be capable of developing an hourly output of about 500 h.p. at the wheel tires at a speed of 35 kilo-metres (21.7 miles) per hour, and another that the motors should be as far as possible similar to the spare motors kept on hand for its other electric locomotives, in order that they may be used in case of emergency. In view of these stipulations, it was decided to adopt motors of the type supplied by the Oerlikon Co. to the Bernese "Decree" Railways, which have been in use for a period of five years with complete satisfaction.

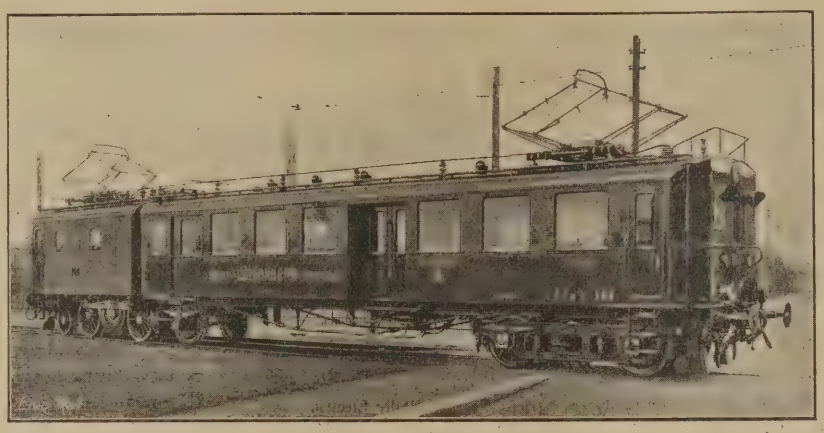


Fig. 1.—New Motor Coach for Swiss Railway.

The electrical equipment of the new coaches, which are somewhat similar in design to those supplied by the Oerlikon Company in 1912 to the Burgdorf-Thun Railway, is concentrated on a truck (fig. 1, left) fitted with a leading axle and two driving axles, the truck being coupled to the main frame carrying the passenger and luggage compartments.

The locomotive portion contains all the electrical control gear (fig. 2). The current, which is single-phase, 16⅔ cycles at 15,000 V, is led from the overhead collector gear through isolating switches to the main circuit breaker, which is constructed for outdoor mounting, and is arranged for electro-pneumatic closing and for automatic electric release. The second pole of the circuit breaker is connected to the h.p. terminal of the oil-immersed self-cooled transformer. In order to improve the cooling, the transformer is enclosed in a second casing, into which air is drawn through the roof; the air passes over the transformer and escapes into the motor compartment. The low-pressure winding has eleven tappings, which are connected to the motor as required for the various speeds, the highest pressure applied to the motor being about 500 volts; the twelve contactors are controlled electro-pneumatically, and are interlocked.

The fan-ventilated motor has ten poles, a one-hour rating of 518 h.p. at 21.7 m.p.h., and a continuous output of 425 h.p. at 24.2 m.p.h., the highest speed being 40 m.p.h. The two driving axles are coupled together by means of a triangular system of rods, and connected to the motor through a jack shaft; in this way it has been possible to use, not only similar motors to those of the locomotives referred to above, but also the same gearing. The driving wheels are 4 ft. 4 in. in diameter, the gear ratio being 1 to 3.78.

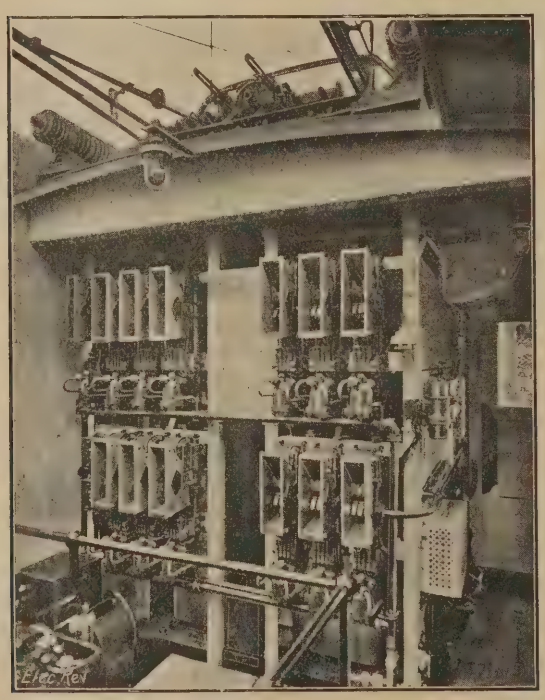

Fig. 2.—Control Gear Behind Driver's Cab.

Fig. 3.—Driver's Cab.

The motor coaches are built for multiple control and automatic acceleration, and are intended for one-man operation. Instead of having a "dead man's" handle on the master controller, the safety device is combined with a foot lever which is depressed by the driver during the operation of the motor coach. When the lever is released, the motor circuit opens after a given in-

terval, and the compressed-air brake is brought into action by a relay; if, however, the driver depresses within this interval a push button mounted on the other side of the driver's cab, the switching-off and braking are prevented. This arrangement was adopted in order to facilitate shunting operations, as the driver must then be able to look out from both sides of the cab (fig. 3). To permit the vehicle to be operated in either direction, the passenger coach is provided with a driver's cab at the opposite end to the locomotive.

The direct current at 36 volts for the control circuits and lighting is supplied by a 1-kW motor-generator set and a battery of accumulators. The train heating bus lines are connected to a tapping of the transformer giving 1,000 volts, through an electro-pneumatically operated circuit breaker. The heating current for the driver's cab is obtained from the auxiliary supply system, which serves the compressor set for the brake and the control gear, being connected to the 220-volt tapping of the transformer.

The Oerlikon Maschinenfabrik was responsible for the whole of the electrical equipment, the Swiss Locomotive and Machine Works, of Winterthur, for the chassis and underwork, and the Swiss Industrial Co., of Neuhausen, for the body work. The vehicles have a standard gauge of 4 ft. 8½ in., and are designed to work on a maximum gradient of 1 in 40. At a speed of 21.7 m.p.h., the tractive effort at the wheel rim is 8,800 lb. (one-hour rating), and at 24.2 m.p.h. 6,460 lb. (continuous). The coach is adapted to carry 60 passengers, although five sitting and 15 standing passengers can be accommodated in the luggage compartment. The overall length of the engine proper is 21 ft. 6 in., and of the complete vehicle 71 ft. 8 in.; the total weight of the motor coach is 60.1 tons, of which the electrical equipment is responsible for 15.4 tons.

Electrical Auxiliaries on Motor Ships.

The Rapid Development of the Motor Ship is Leading to the Extended Use of Electrically-driven Auxiliary Machinery.

By ALFRED REGNAULD, B.Sc.(Eng.), Lond., M.I.E.E.

A VERY notable feature of the shipbuilding industry during the few years which have elapsed since the cessation of the Great War has been the almost phenomenal development of the heavy oil engine as a means of propulsion. In Lloyd's Register of Shipping almost the whole of the merchant shipping of the world is classified, and, in addition to publishing its famous "register" every year, Lloyd's Register Society also issues an annual report covering its operations for the year and containing a review of the position of the merchant services of the world. The report covering the year ended June 30th, 1925, has recently been issued, from which it appears that whereas in July, 1919, there were 912 motor-ships of 752,606 gross tons classified in Lloyd's register (the figures for 1914 were only 297 motor-ships of 234,287 gross tons), in July, 1925, there were 2,145 motor-ships of 2,714,073 gross tons. These figures appear even more striking when it is mentioned that of the total tonnage classified during the twelve months ending June 30th, 1919, motor-ships only represented 2.02 per cent., while for the year ending June 30th, 1925, motor-ships classified represented 23.1 per cent. of the total. It is an ill wind which blows nobody any good, and while the economists may lament the rapid growth in the use of oil instead of coal for the propulsion of ships in view of its effect upon the coal mining industry, it is a fact that the development of the motor-ship has been accompanied by a corresponding development in the use of electrically-operated machinery for the various auxiliary purposes on board, such as air compressors, oil fuel, bilge and sanitary pumps, and cargo-handling gear.

On steam engine-driven vessels, with the exception of high-class passenger liners, it is generally considered advisable to employ steam for driving the bulk of the auxiliary machinery, both in the engine room and on deck. Steam is generally available from one or more of the main boilers for stand-by purposes, since it takes a considerable time to raise steam from cold when the vessel is preparing to leave port, while on vessels which stay for considerable periods either a donkey boiler is installed or one of the main boilers is scheduled off for supplying the steam to the auxiliaries. On motor-ships, on the other hand, there is no question of steam being required for stand-by purposes, as soon as the ship is moored, the main engines are completely shut down and one or more auxiliary Diesel-engine-driven generators are started up for supplying power for auxiliary purposes and for operating the cargo winches. In some of the earlier motor-ships steam-driven auxiliaries were employed, and even to-day on vessels which carry oil in bulk it is considered advisable to have steam available for warming the oil to reduce its viscosity for pumping purposes, but a study of the equipment of recent Diesel-engine-driven ships will show that the tendency is towards the complete adoption of electrically-driven auxiliaries.

A glance at the equipment of a few typical motor-ships will serve to indicate the extent to which electrical machinery is being employed at the present time, and will give some idea of the size and nature of that machinery. Consider, first of all, two typical cargo ships, one of small tonnage, used for coasting trade and trade as far as the Mediterranean ports, and the other a cargo liner, such as might be employed for trading to any part of the world. It may be noted in passing that the cargo ship forms the bulk of the mercantile marine of this, or, indeed, any other maritime country, and that it is on vessels of the cargo-carrying class that the widest market for electrical machinery will be found. The small coaster is a vessel 240 ft. long of 3,300 tons displacement, built for the fruit trade between this country and Spanish and Italian ports. She is propelled by a single six-cylinder Diesel engine which develops 1,250 b.h.p. at a speed of 120 revs. per min., giving the vessel a speed of about 11 knots. For operating the various auxiliary machinery she is equipped with three two-cylinder Diesel-engine-driven, direct-current generators of 50-kW capacity, the engines developing about 75 b.h.p. at 250 revs. per min.; at least one of these sets is available as a stand-by. The auxiliary machinery in the engine room comprises air compressors, fuel and lubricating oil pumps, bilge and sanitary pumps, jacket water circulating pumps, &c., all electrically driven, involving the use of about a dozen electric motors varying in size from 1½ h.p. for the fuel oil pump to 80 h.p. for the air compressor. In addition, there are on deck six electrically-driven winches of 16 h.p. each and a windlass driven by a 50-h.p. motor. All these, together with the steering gear, electric light fittings, wireless apparatus, and all the necessary switchgear and wiring, represent a fairly valuable electrical installation.

The second typical motor-ship is 412 ft. long and of 8,000 tons displacement, being propelled by an engine of 3,000 i.h.p. She was built for general cargo work all over the world. In this ship also there are three Diesel-driven generators for supplying current to the

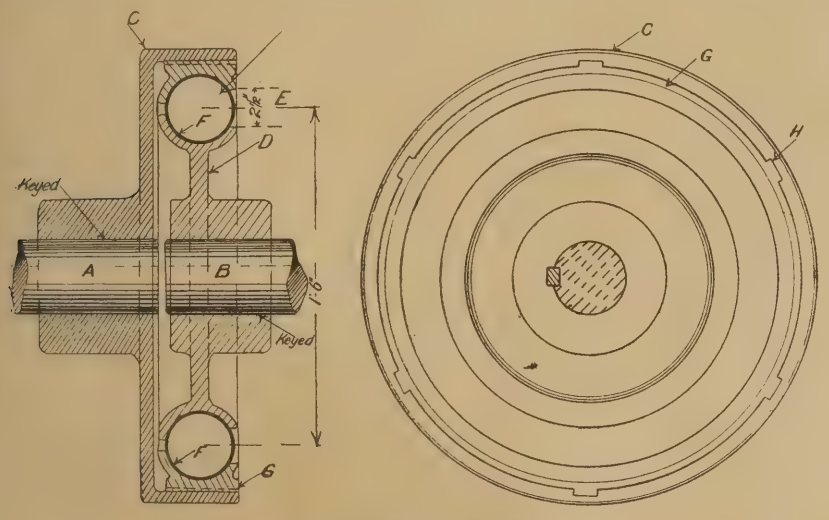
auxiliaries, two of these being three-cylinder sets of 150 b.h.p. and the other a two-cylinder, 100-b.h.p. set, the generators being of 100- and 75-kW capacity respectively. The auxiliary machinery in the engine room is all electrically driven, being somewhat similar to that detailed above, but, of course, of correspondingly greater power, while additional motors are used for driving the machinery in a small workshop and a motor-generator which reduces the generator voltage from 220, at which value it is used for the bulk of the motors, to 110 volts for ship-lighting purposes. The deck machinery comprises 10 electric winches, six being of three tons lifting capacity and four of five tons capacity, together with a five-ton warping winch and a windlass, both electrically driven. The steering gear is of the electric-hydraulic type driven by a constant-speed motor of 12 h.p.

It will be of interest next to consider the electrical equipment of a large motor passenger ship. While, numerically, this class of vessel is not of the same importance as the cargo ship, the aggregate amount of power utilised and therefore the value of the electrical equipment on such a vessel is very much greater. Two large Diesel-engine-driven liners are being built for the services between Southampton and South American ports which are maintained by the Royal Mail Steam Packet Co. These vessels, one of which has already been launched and is expected to run her trials early in the new year, are 655 ft. long and of 22,000 gross tons. They are propelled by two eight-cylinder double-acting four-stroke cycle Diesel engines, each of 10,000 h.p., these units representing the largest marine Diesel units which have been constructed to date. The whole of the auxiliary machinery, with the exception of a steam-driven emergency air compressor, is electrically driven, and, in addition, the lighting and heating of the passenger accommodation, as well as the whole of the cooking, will be carried out by electricity. Current for all purposes throughout the vessel is obtained from four 400-kW generating sets, each driven by a four-cylinder, single-acting, four-stroke Diesel engine. There is, in addition, a 75-kW Diesel-driven generator for emergency purposes fitted in a compartment above the water line for use should the engine room be flooded. The engine-room auxiliaries include three manœuvring air compressors, each driven by a motor of 180 b.h.p., two refrigerating machines, each driven by a motor of 110 b.h.p., and all the necessary pumps and fans for use in conjunction with the refrigerating machinery. In addition, there are the necessary fuel oil, lubricating oil, ballast water, sanitary water, fresh water and bilge pumps, all electrically driven. A feature of these vessels is the deck cranes, which are hydraulically driven, the water under pressure being obtained from pumps which are situated in the machinery space, each being operated by an electric motor of 110 b.h.p. On deck, the electrical equipment includes a 135-h.p. warping winch, two 150-h.p. capstans, a 135-h.p. windlass, and the continuously-running motors for operating the electro-hydraulic steering gear. The watertight doors which are fitted in the various bulkheads are also electrically operated, the control being effected from the bridge, where an indicator shows whether any particular door is open or shut.

The electrical equipment in the passenger accommodation is on a correspondingly large scale, and comprises some 4,000 electric lamps, 500 cabin and ceiling fans, as well as about 500 heaters in the public rooms and cabins. In addition, there are 50 large electrically-driven fans which deliver fresh air through trunkways throughout the accommodation. The cooking throughout the vessels, both for the passengers and the crew, will be done by electricity, and, in addition to the cooking ranges, two large bakers' ovens, the grills, toasters, griddle plates, fish frvers, and salamanders are all electrically heated. Even in the hospital and the barbers' shops electrical equipment is employed comprising kettles, sterilisers, &c., while in the latter electrically-heated hair dryers and vibro-massage machines will be installed.

The Diesel-driven passenger liner *Aorangi*, belonging to the Union Steam-Ship Co. of New Zealand, which, it may be recalled, was completed at the end of last year and has since taken up her station on the service between Vancouver, New Zealand and Sydney, might have been taken as an example of a large passenger motor-ship—she is 580 ft. long and of 17,500 tons gross—but it happens that a number of her auxiliaries as well as the deck machinery are operated by steam. In spite of this, her electrical equipment is very complete, comprising four Diesel-driven generators of 300 kW each, three of which are required to carry the load, one serving as a stand-by. It will serve to illustrate the extent to which power is required on board ship for operating the auxiliaries if figures giving the fuel consumption of the *Aorangi* are quoted. On a recent voyage the total fuel consumption was found to be 43.6 tons per day for the main engines and 9.4 tons per day for the auxiliaries, the latter representing 17.7 per cent. of the total. It is not stated what proportion of the auxiliary consumption was used for steam raising, but, in any case, the figures may be regarded as a proof of the rough-and-ready rule that of the total power required on board ship about 15 per cent. is utilised for driving the auxiliaries.

With the development of the motor-ship the interesting fact emerges that approximately one-seventh of the total power utilised in operating the ships of the merchant services of the world will one day be utilised in the form of electrical energy. This represents an enormous amount of electrical equipment in the form of generators, motors, switchgear, &c., all of which can be economically and efficiently manufactured in this country. Lord Inverforth, in his recent presidential address to the Institute of Marine Engineers, gave it as his considered opinion that after long experience with steamships, when all allowances are made for the greater first cost of the motor-ship, it is, especially in running costs, a more economical proposition. He specially mentioned the electrically-operated deck machinery as being very economical, and quoted the average fuel consumption per day for electric winches as being 0.6 ton of oil as against for steam winches 1½ tons per day, with oil-fired boilers, and four tons per day with coal-fired boilers. Electric winches have often been criticised on the score of unreliability, but while this criticism may have been more or less justified in the past, it is certainly not justified to-day with any of the reputed makes. The same criticism might have been—and, indeed, has been—levied against all electrical machinery on board ship, but experience has shown that where care is taken in the design and manufacture to keep in mind the peculiar conditions under which such machinery is to operate, then electrical machinery is second to none, both in economy and reliability.



Variation of Radio Station Bearings.—The Radio Research Board (Department of Scientific and Industrial Research) has published the second part of its report upon an investigation into the variation of the apparent bearings of radio transmitting stations that is being carried out under the direction of Mr. R. L. Smith-Rose, of the National Physical Laboratory. Part II (Special Report No. 3, H.M. Stationery Office, 4s. 6d. net) deals with the progress of the investigation from March, 1922, to June, 1923, when observations on the longer waves of from 2,000 to 9,000 metres were discontinued at all the University and Service stations forming the original organisation. In July, 1923, the opportunity occurred for carrying out further observations at a station in higher latitudes than in England, *viz.*, at Lerwick, Shetland Islands. The discussion of the remaining observations carried out on the shorter wave-lengths down to those of 450 metres from 1922 to 1924 will follow in the publication of Part III. It is desirable again to emphasise the difference in effects which has been observed in working overland oversea: On the longer waves the situation of the transmitting and observing stations was such that all the paths of transmission less than 200 miles in length were entirely overland, which fact accounts for the abnormally large variations recorded at night for ranges of from 100 to 30 miles. For distances of less than 30 miles, the majority of the direction-finding readings are found to be accurate to within 2 deg. When the path between the transmitting and observing stations is entirely oversea, and free from any land or coastline effects, the errors in observed bearings lie within the above 2 deg. limits for all ranges up to nearly 100 miles. This accuracy is generally sufficient for most navigational purposes; also, for oversea working a 100-miles range is adequate for the ordinary application of radio direction-finding to marine navigation.

A Pneumatic Flexible Shaft-Coupling.

By J. T. TOWLSON.

THIS is a device designed to function as a driving member between such elements as a motor and a generator, more especially when the machines are not rigidly fixed on a common bedplate, and where there is an absence of "dead" alignment through the two machines. As is well known, such is the purpose of all flexible couplings, the particular requirements for these being that provision must be made for an "endwise," conjointly with a relative diametrical, movement of the two parts of the coupling. The allowance "endwise" is needed on account of the proclivity of d.c. armatures to develop an appreciable floating movement, while the diametrical allowance in the coupling provides against undue or abnormal strain, which would otherwise cause trouble, as a result of want of alignment of the two machines, *i.e.*, the motor and the generator.

The new pneumatic flexible shaft-coupling, it is claimed, possesses the requirements for a two-way movement in a convenient form. For such provision, an air-expanded tube, circular and continuous, is the main

Pneumatic Flexible Coupling.

factor. This tube, of pneumatic tire form, provides the driving medium between the motor and the generator.

Referring to the sketch, it will be seen that a space of (for example) 2½ in. is provided between the outside diameter of the inner ring and the inside diameter of the outer ring. Through this space the uninflated tube is pressed, and after it has passed into position it is inflated to the necessary pressure by the usual means and with the usual connections.

The qualities of the pneumatic tire, in which the pressure at a point is distributed throughout the whole of the tire, are here in full operation; alterations of relative position of the two parts of the coupling, as it is rotated, are freely and "sweetly" compensated for by the automatic flattening of the tube at the position of smallest space. End-wise movement has been generously provided for in the design, there being a floating ring interposed between the driver and the driven member. This ring, with its ample and positive "feather" drive, is allowed to slide freely in the outer ring of the coupling, and thus permits endwise movement of the respective armatures.

Referring to the sketches, A may be the driving shaft, and B the driven one, or *vice versa*. C is the outer ring, slotted as at H, and D is the inner ring. E is the 2½-in. space, by way of which the 4-in. tube (uninflated) is pressed into the circular space provided. F is the tube, shown inflated. G is the intermediate sliding and compensating ring. The driving power of the tube will vary as the pressure of inflation; it may be increased by corrugating the surfaces with which it is in contact. The coupling illustrated transmits 100 h.p. at 480 r.p.m.

London and Home Counties Joint Electricity Authority.

Report of Proceedings at the end of last year.

THE following is a brief *résumé* of the matters dealt with by the London and Home Counties Joint Electricity Authority on December 30th, 1925:—

Finance Committee.—It is understood that most of the schedules submitted by the London electricity companies to the London County Council for the purpose of identifying the value of the assets of the companies (which is necessary for the final settlement of the standard prices) are now being examined by the L.C.C.'s officers, assisted by Messrs. J. H. Rider and W. Cash.

The J.E.A. approves of the L.C.C.'s action in this connection.

General Purposes Committee.—The J.E.A. has agreed to the principle of remunerating its chairman.

Upon the suggestion of the Conference of Local Authorities owning Electricity Undertakings in Greater London, the J.E.A. is to consider the existing methods of valuation of electricity undertakings for assessment for rating purposes. The present system, it is claimed, inevitably leads to very serious inequalities and fluctuations in values, the effect of which is that the earning capacity of different undertakings is burdened unequally in respect of rates.

Technical Development and Works Committee.—The appointment of an advisory technical committee has been postponed until the technical reorganisation schemes for the London area have been fully considered.

The J.E.A. has received applications for special orders from (*a*) the County of London Electric Supply Co., Ltd., to supply the Parish of Merstham in the rural district of Reigate, and from (*b*) Callender's Cable and Construction Co., Ltd., to supply part of the Parish of Chessington in the rural district of Epsom; there is no authorised distributor in either area, but both are within the J.E.A.'s district. On the advice of Mr. J. H. Rider (technical adviser retained by the J.E.A.) formal objection is being made in both cases on the ground that Section 10 of the schedule of the London Order requires the J.E.A. to submit proposals to the Commissioners for the supply of areas within the district not now forming part of the area of any authorised distributor.

The application of the London Power Co., Ltd., for the Electricity Commissioners' sanction to lay new transmission mains from the Deptford power station and elsewhere is being considered by the J.E.A.'s technical adviser. No objection has been offered to the Westminster Electric Supply Corporation and the St. Marylebone Borough Council altering the system of supply to certain premises. Mr. Rider is to investigate at once the provision of bulk supplies in the western section of the J.E.A.'s area, together with the possibility of developing existing stations (where desirable) and the erection of a capital station. In this connection also Mr. Rider will take into consideration the Barnes Urban District Council's and the Kingston-upon-Thames Corporation's proposals for station extensions and bulk supplies respectively.

Committee Chairmen.—The following gentlemen will preside over the J.E.A.'s various committees during the ensuing year:—

Finance: Chairman, Mr. A. Emil Davies, L.C.C.; vice-chairman, Councillor B. J. Samels.

General Purposes: Chairman, Alderman C. R. Attlee, M.A., M.P.; vice-chairman, Mr. W. F. Marchant, L.C.C.

Technical Development and Works: Chairman, Alderman Duncan Watson, J.P., M.I.E.E.; vice-chairman, Lt.-Col. F. A. Cortez Leigh, M.Inst.C.E., M.I.M.E., M.I.E.E.

A Novel Power Scheme.—We learn from *Power* of a remarkable power scheme originating from Germany which provides for the erection of a steel tower 1,950 ft. high, to serve a double function as an electrical generator and a wireless station. As a generator it will have a capacity of 6,000 kW. Two enormous wind wheels will be provided which, it is said, will "stir" in the gentlest breeze. The cost of the tower is estimated at $1,000,000, and that of the electrical machinery at $500,000.

A 40,000-kVA Frequency Changer.—What is claimed to be the largest frequency changer ever built is approaching completion at the works of the Westinghouse Electric and Manufacturing Co., at East Pittsburg, Pa., U.S.A. It has a rating of 40,000 kVA at 300 r.p.m., 3-phase, 25 and 60 cycles. The design of the 60-cycle end of the machine incorporates an arrangement by which the stator may be shifted by means of a motor-driven rotating gear. This provision is for the purpose of adjustment of phase position, and thereby load adjustment. The machines are cooled by a closed ventilating system which includes air-washers.

Business Notes.

Commercial and Industrial Developments, Business Changes, Trade Opportunities, New Publicity Literature, Liquidations and Failures.

The "Electrical Review" Index.—The Index for the last half-yearly volume of the ELECTRICAL REVIEW (July to December) is now being printed. Copies will be forwarded post free to those requiring them for binding or for reference purposes, if they will make application to the Publisher, ELECTRICAL REVIEW, 4, Ludgate Hill, E.C.

Electrical Exhibitors at Birmingham.—The following is the list of electrical companies and firms who had taken space at the British Industries Fair, Birmingham (February 15th to 26th) down to the end of last week :—

Barratt & Wakefield, Ltd.
Belling & Co.
Beuttell, A. W., Ltd.
Birmingham Electric Supply Dept.
British Electric Transformer Co., Ltd.
British Electrical Repairs, Ltd.
Burnand, W. E., & Co.
Cable Accessories Co., Ltd.
Castle Fuse & Engineering Co.
Chloride Electrical Storage Co., Ltd.
Coley & Swinnerton, Ltd.
Credenda Conduits, Ltd.
Crewe, Morgan & Co.
Daulby, S. J.
Edison Swan Electric Co., Ltd.
Electric Heating & Hardware, Ltd.
English Electric Co., Ltd.
General Electric Co., Ltd.
Hewittic Electric Co., Ltd.
Higgs Motors.
Imperial Engineering Co.
Jackson Electric Stove Co., Ltd.
K.F.M. Engineering Co., Ltd.
London Electric Wire Co. and Smiths, Ltd.

New Showroom.—The Richmond Electric Light and Power Co., Ltd., has recently opened a new showroom in George Street, one of the principal thoroughfares of Richmond, Surrey. The new showroom is much more accessible and attractive than the company's original premises.

The Electrical Industry.—Sir Hugo Hirst, chairman and managing director of the General Electric Co., Ltd., expressed his views on the industrial position as follows in the *Financial News* on January 1st :—"The prosperity enjoyed by the electrical industry seems to me a good index of greater activity among most industries in the country. I am hopeful that the unostentatious policy of the present Government, working for political peace abroad and industrial peace at home, may continue to be successful and strengthen the confidence which is gaining ground in all classes of society, and which is the foundation of all further development. The continuation of industrial peace will bring about the right mentality, both of employers and employed, and I am sure will restore gradually normality even in the coal, steel, and shipbuilding industries, which are to-day still suffering greatly."

Meter Approved.—The Electricity Commissioners have approved of the construction and pattern of the meter known as the Sangamo-Ediswan D.C. Type "N H" Mercury Motor A.H. Meter, rated from and including 2.5 amps. to 1,000 amps.

Aiding Registered Contractors.—The Newcastle-upon-Tyne Electric Supply Co., Ltd., is encouraging its present and prospective consumers to employ only registered contractors for their electrical work. This is done by means of two posters which are framed and hung in prominent positions in the showrooms of the company and its associated concerns. One of the posters impresses upon the reader the advantages obtained by employing registered contractors, while the other contains a list of such contractors in the company's area of supply.

For the Wireless Retail Trader. — "The Wireless Retailers' Handbook," of which we have already made brief mention, has now come to hand. *Bona-fide* wireless retailers can have copies free on application to the Wireless Retailers' Association, 70, Finsbury Pavement, London, E.C.2. Including advertisements, the pamphlet consists of 100 pages. The literary contents comprise particulars of the Association and its activities, also a number of articles and tables likely to be useful to retailers in the daily conduct of their business, on such subjects as price-cutting and the remedy, patent royalties and licences, the Shops' Act, British standard terms and definitions, table of the principal valves, &c.

Electrical Engineering in the North.—A special correspondent of the Manchester *Daily Dispatch* states that while general engineering in the area has only slightly improved, in certain sections, the outlook is certainly better. In the electrical branch order books are filling up, and, although there is not yet any marked call for extra workers, the regularity with which work required follows work completed is encouraging, and guarantees steadiness of employment.

Commercial Education.—The annual presentation of medals and prizes to the successful candidates in the Commercial Education Examinations of the London Chamber of Commerce will take place, under the presidency of the Lord Mayor, at the Mansion House on Friday, February 5th. The Duchess of Atholl, D.B.E., M.P. (Parliamentary Secretary to the Board of Education) will present the awards.

Social Events.—The annual dance of the Glasgow staff of the General Electric Co., Ltd., was held on December 28th. There was an attendance of over 300. Many original and novel ideas were introduced and Mr. G. A. Scott Walker and his committee were congratulated on the success of the function.

The St. James' Electric Rifle Club held its annual prize distribution on December 23rd, the chair being taken by Mr. F. J. Walker, the president, who welcomed Sir Alex. B. W. Kennedy, F.R.S., the chief engineer to the St. James' and Pall Mall Electric Light Co., Ltd. The prizes were distributed by Mrs. Andrews. The championship of the club was won by Mr. F. O. Andrews, who carried off the "Walker" and the "Deane" challenge cups and the rose bowl. The runner-up in the last two events was the hon. secretary, Mr. C. P. Fox.

The annual staff dance of the Sheffield Corporation Electric Supply Department was held on New Year's Eve, and was attended by a company of about 120.

American Electrical Vehicle Exports.—Figures just to hand show that 18 electrical vehicles valued at £4,768 were exported from the United States during October last as compared with only 8 (£1,001) in the preceding month and 18 (£4,885) in October, 1924.

Commercial Buildings in Demand.—MESSRS. LEOPOLD FARMER & SONS, London, report that during 1925 there was a constant demand for factory and commercial property, and in recent months that demand has considerably grown, due, in many cases, no doubt, to the progress of the Safeguarding of Industries measure, which has proved a great incentive for the acquiring of factories all over the country by British, as well as foreign firms. The increased activity in trade generally is also another important factor for the enlargement of works, and the establishment of new ones. At the present moment there are as many inquiries for factories as there have been for some years, if not more.

Lead.—Reporting on December 31st, 1925, Messrs. James Forster & Co. stated :—"Consumers have been buying fairly well lately, but not in any quantity to justify rising prices. Consumption has been about 'top notch' for months past, and cannot be expected to increase. Normal imports from Australia will, of course, follow after January, which will mean a return to about 8,000 tons per month, against 25,000 tons in October and November shipments. The course of the market greatly depends on whether the Continent recovers its absorption powers or continues to dump lead here which it has bought and cannot absorb."

To Avoid Competition in France.—Discussions have begun among the electrical manufacturing works in France with the object of reaching an agreement for the avoidance of "mutual competition" and for obtaining better selling prices.

Tradesmen Using the Royal Arms.—The *London Gazette* for January 1st contains lists of tradesmen in London and elsewhere who hold appointments to Royalty with authority to use the Royal Arms.

Trade Announcements.—For family reasons the business of MESSRS. E. P. ALLAM & CO., of 107-109, Gray's Inn Road, London, W.C.1, has been converted into a private limited liability company, under the style of E. P. Allam & Co., Ltd. There will be no alteration in the management and staff.

MESSRS. F. GILMAN (B.S.T.), LTD., of Smethwick, have purchased the business of Messrs. G. F. Clements & Co., Regent Street, Smethwick, manufacturers of boiler scaling tools. The business of that firm will now be dealt with from the main offices of Messrs. Gilman, Grange Works, Smethwick.

The GEAR GRINDING CO., LTD., Birmingham, has established, in Milan, Italy, the Società Italiana Rettifica Ingranaggi (S.I.R.I.). The works will be equipped and operated on similar lines to those employed in the Birmingham shops.

From announcements which are prominently made in our advertisement pages this week it will be seen that STANDARD TELEPHONES & CABLES, LTD. (formerly Western Electric Co., Ltd.), has entered into an agreement with the Birmingham Small Arms Co., Ltd., whereunder the products of the former company in connection with radio broadcast receiving apparatus, will be distributed by the two companies in the future. The Birmingham Small Arms Co., Ltd., has formed a new company (B.S.A. Radio, Ltd.), to develop the sale of such apparatus, and this new company, under an agreement with Standard Telephones & Cables, Ltd., has a range of apparatus in preparation. The manufacturing and distributing organisations of the two companies will be available to manufacture and market present and future products in pursuance of a common policy.

The announcement that the B.S.A. Company has entered the wireless field is the most interesting of recent trade events. While it will be of undoubted interest to the motor and cycle trade it will, we know, be of particular interest to the wireless trade. The B.S.A. trading policy which has been so popular with the cycle and motor-cycle trades will be followed in the company's connection with the wireless industry. Details of the B.S.A. radio products will be published later, but agents who are interested in the sale of wireless apparatus should send in their names to B.S.A. Radio, Limited, Small Heath, Birmingham, so that they can be entered on the company's trade register to ensure receiving full particulars of B.S.A. radio broadcast apparatus from time to time. Mr. J. W. Bryan, the firm's publicity manager, who has been closely connected with the company's sales departments, will be in charge of all matters relating to sales of B.S.A. Radio, Ltd.

THE PHOTECTOR CO., LTD., has removed to 711-715, Fulham Road, London, S.W.6.

MAGNUM ELECTRIC APPLIANCES have just opened larger premises at Magnum Works, Upper Elmers End Road, Elmers End, Kent, in consequence of increased business.

The premises of Mr. ALAN E. DENT, Russell Street, Nelson, were damaged by water used upon an adjacent fire on January 1st; Mr. Dent is therefore temporarily occupying premises at Croasdale Buildings, Nelson. He desires to obtain a fresh stock of catalogues and lists from factors and manufacturers.

Catalogues and Lists.—THE MARCONIPHONE CO., LTD., 210-212, Tottenham Court Road, W.1.—A pair of coloured cardboard cut-outs advertising "Marconi" valves.

THE ENGLISH ELECTRIC CO., LTD., Queen's House, Kingsway, W.C.2.—Price List No. 2,071, dealing with the company's oil-immersed switch-fuses, and Publication No. 586, describing "Class XR" induction regulators. Both are well illustrated.

MESSRS. FRY & CO., LTD., Maskell Street Works, Rusholme Road, Manchester.—Price lists of "Efanco" cotton-covered instrument wires, and "Eiffel" inductance coils.

THE AUTOMATIC TELEPHONE MFG. CO., LTD., Milton Road, Edge Lane, Liverpool.—A set of three coloured showcards advertising the company's "Claritone" loud speakers and telephones.

MESSRS. CROMPTON & CO., LTD., Chelmsford.—List A.6, illustrating and describing the company's 3-phase induction motors of various sizes and for a number of frequencies.

THE BRITISH ELECTRICAL & MANUFACTURING CO., Clavering Place, Newcastle-upon-Tyne.—A priced and illustrated pamphlet advertising the "Orion" vacuum cleaner.

THE EDISON SWAN ELECTRIC CO., LTD., 123-5, Queen Victoria Street, E.C.4.—An illustrated and priced catalogue of lighting fittings for offices, shops, restaurants, and public illumination.

THE GENERAL ELECTRIC CO., LTD., Magnet House, Kingsway, W.C.2.—A booklet directing the reader to the company's headquarters, giving railway, tramway, and omnibus routes.

THE GOODYEAR TYRE & RUBBER CO. (GREAT BRITAIN), LTD., Chelsea Wharf, Lots Road, S.W.10.—A booklet containing particulars of the company's transmission belting and data regarding the subject of belt drives.

THE STONEBRIDGE ELECTRICAL CO., LTD., Victoria Road, North Acton, W.3.—List No. 93, dealing with portable dynamometer precision and commercial instruments.

MESSRS. BAXTER & CAUNTER, LTD., 219, Tottenham Court Road, W.1.—A comprehensive price list of electrical materials, accessories, and appliances, including pumping sets, cables, domestic appliances, battery-charging switchboards, &c.

MESSRS. L. MCMICHAEL, LTD., Wexham Road, Slough.—An illustrated and priced pamphlet dealing with fixed condensers and grid leaks.

Calendars, Diaries, &c.—From the SUN ELECTRICAL CO., LTD., of 118-120, Charing Cross Road, London, W.C.2, we have received a set of refills slips for its desk calendar for 1926.

A Letts's "Quickref" Engineer's Handbook and Diary for 1926, containing much engineering data in tabular and other form, has been received from INTERNATIONAL COMBUSTION, LTD., of Africa House, Kingsway, W.C.2.

A wall calendar with monthly sheets for 1926 has come to hand from our contemporary the *Chemical Trade Journal*.

In accordance with their long-established custom, MESSRS. W. H. WILLCOX & CO., LTD., 38, Southwark Street, London, S.E.1, have prepared a hanging Date Remembrancer with monthly sheets for the coming year.

BROOKHIRST SWITCHGEAR, LTD., is very regular in its supply of calendar cards. We have received those for the first three months of 1926. The excellent views of Chester have been replaced by pictures of the company's products.

MESSRS. DOWNES & DAVIES, 1 & 3, Stanley Street, Liverpool, have sent us a calendar upon which appears a study in colour of "My Lady Fair." Monthly date slips are provided.

From MESSRS. ROPER BROS., 5, South Anne Street, Dublin, we have received a block of daily slips for 1926 to replace those which we received last year.

MESSRS. B. S. & W. WHITELEY, LTD., of Pool Paper Mills, Pool, near Leeds, have prepared a calendar with daily slips, each bearing a literary quotation.

MESSRS. EVERSHED & VIGNOLES, LTD., Acton Lane Works, Chiswick, London, W.4, have sent us a neat calendar for 1926 each monthly sheet of which has a picture of some charming house, or village or country scene.

From MESSRS. RD. JOHNSON, CLAPHAM & MORRIS, LTD., Manchester, we have received a wall calendar, above the date slips of which is a view, taken from the air, of the company's head offices and works. Accompanying it is a pamphlet containing a well-illustrated description of the company's new warehouse building.

The calendar of the LONDON MAGNETO REPAIRING & WINDING CO., LTD., of 78, Hampstead Road, Euston, London, N.W., illustrates in colour the welcome accorded to Muriel or Daphne on her arrival by car.

An artistic wall calendar has reached us from the LANCASHIRE UNITED TRAMWAYS, LTD.

THE BRITISH EBONITE CO., LTD., of Hanwell, London, W.7, has issued a small wall calendar with two-monthly removable slips, humorously illustrated.

THE ENGLISH ELECTRIC CO., LTD., of Queen's House, Kingsway, London, W.C.2, has prepared a daily block calendar with clear red figuring.

THE S.E.A. CO., LTD., of Lichfield Street, Hanley, has circulated a wall calendar with humorous illustrations depicting "Wireless Howlers"; two months to the sheet.

MESSRS. POPE'S ELECTRIC LAMP CO., LTD., of 5, Arthur Street, New Oxford Street, London, W.C.2, have sent us a wall calendar with monthly sheets boldly figured.

A "Utility" calendar with bold-figured daily slips has been received from Mr. Cecil Ridley, 35 and 37, Dundas Mews, Middlesbrough.

A view of a ruined riverside abbey appears upon the calendar sent us by MESSRS. DORMOR & HINES, 74, Old Christchurch Road, Bournemouth. The bottom forms a pocket for letters, &c., and has monthly date sheets.

A large-scale representation of a valve, in which appears the portrait of a pretty girl, forms the calendar of the MULLARD WIRELESS SERVICE CO., LTD. There is also a block of daily slips.

MESSRS. G. S. PECKHAM & CO., of 4 & 5, New Compton Street, Charing Cross Road, London, W.C.2, have prepared a very serviceable desk reminder for the entry of engagements. One page per week gives ample daily space.

MESSRS. MCWHIRTER & SONS, LTD., Wharf Street, Cardiff, have sent us one of their 1926 calendars consisting of a picture of a re-winding job and a block of daily slips.

An artistic calendar with a separate sheet for each month has been received from MESSRS. PHILIPS LAMP, LTD., 60, Wilson Street, Finsbury Square, E.C.2.

MESSRS. W. H. SUGDEN & CO., LTD., have issued a useful calendar comprising monthly sheets with space for notes against each date.

We have received, as usual, the COUNTY OF LONDON ELECTRIC SUPPLY CO.'s telephone card. This year's picture is a coloured view of the new Barking station.

Bankruptcy Proceedings.—J. BRODIE, electrical engineer, 59, High Street, Dunfermline.—Public examination at the Sheriff Court House, Dunfermline, January 7th. Meeting of creditors at Messrs. MacBain & MacDonald's offices, Commercial Bank Buildings, High Street, Dunfermline, January 21st.

H. E. CHECKLEY, plumber and electrician, 20, West Street, Morecambe.—Trustee, Mr. J. F. Warburton, 28, Queen Street, Manchester, released September 17th.

Company Liquidations.—BELGRAVIA ELECTRICAL CO., LTD., 23, Old Queen Street, S.W.1.—A meeting of creditors was held recently at the offices of Messrs. Annan, Dexter & Co., when the chair was occupied by the liquidator of the company, Mr. W. H. Lovatt. The liquidator said that a private meeting was held in November, when a statement of affairs was submitted. Since that time the assets and liabilities had not altered to any great extent. It was also agreed at the last meeting that Mr. Marquand, one of the directors, should offer the creditors 10s. in the £ in settlement of their debts. Soon after that meeting the company was put into liquidation, and Mr. Marquand had informed the liquidator that it was now impossible for him to make the offer of 10s. Mr. Gardner, representing creditors, asked if any particulars could be given with regard to the debenture for £500. The liquidator replied that the debenture did not become valid until January, 1926, and before that date he would repudiate the validity of that debenture. The only thing remaining for the creditors now was for the assets to be distributed amongst the creditors *pro rata*. The net assets were £188, and the total liabilities were approximately £700. No resolutions were passed, and the matter therefore remains in the hands of the present liquidator.

SEXTON-BARNES, LTD., 61, Borough Road, S.E.1, engineers and electrical and radio manufacturers.—A meeting of creditors was held on December 30th, at the offices of Messrs. Poppleton, Appleby & Hawkins; the chair was occupied by Mr. W. Baker, who represented the liquidator of the company, Mr. E. H. Hawkins. Mr. Baker presented a statement of affairs which showed liabilities of £1,482, all due to unsecured creditors, and net assets of £457. The chairman said that at a private meeting held recently figures were presented but no particulars with regard to the trading of the company were given, and it was decided to form a committee to go into the affairs of the company. The Committee came to the conclusion that it was impossible for the business to be continued, and accordingly the shareholders passed the necessary resolution for liquidation, with Mr. Hawkins as liquidator. The company was registered in December, 1924, with a capital of £200, divided into 4,000 shares of 1s. each. The gross profit

from the commencement of the business down to December 11th, 1925, amounted to £310. Against that the overhead expenses were £1,354, which resulted in a total loss on trading of £991. Mr. Baker said that he hoped to be able to effect a sale of the assets, in which case the creditors might eventually receive a small dividend. No resolutions were passed, and the matter therefore remains in the hands of Mr. Hawkins as liquidator, together with the committee of inspection appointed at the previous meeting.

The following are creditors :—

	£		£
Benjamin Electric, Ltd.	97	L.C. Engineering Supplies, Ltd.	62
Burgess, Frederick	26	Noble, E. A.	53
Cobalt Magnet Steel Co., Ltd. ...	82	Ormiston, P., & Sons	30
Crofts, Ltd.	21	Palmer, J., & Sons, Ltd.	32
Corfield, Ltd.	82	Pickering, G. F.	242
Dyson & Co., Ltd.	61	Sanderson Bros. & Newbold, Ltd.	46
Bankers	20	Sankey, J., & Sons, Ltd. ...	22
Lloyd, R., & Co., Ltd.	22	Tickle, L. B.	314

LOW TEMPERATURE CARBONISATION, LTD.—A petition for the winding up of the above-named company has been presented to the High Court by the Dursley Gas Light and Coke Co., Ltd., of Dursley, Glos., creditors, and will be heard in London on January 12th.

L. WEEKES, LTD.—Winding up voluntarily. Liquidator, Mr. B. T. Crew, George Street, Luton.

PREMIER ELECTRIC WELDING CO. (CLYDE), LTD.—Winding up voluntarily. Liquidator, Mr. T. L. McLintock, 216, West George Street, Glasgow. Meeting of creditors, January 8th, at the offices of the liquidator.

Unemployment. — There was a further decrease in the number of unemployed during the week ended December 21st, the total at that date being 1,102,400, a fall of over 25,000.

Local Exhibition.—BURNLEY.—The Corporation has decided to organise an electrical exhibition from January 28th to February 6th, and during the same period electrical films will be exhibited at the Pavilion Picture House.

The German Insulator Industry.—The Berlin correspondent of the Exchange Telegraph Co. states that the business situation in the porcelain insulator industry became worse in November and December. The November figures show a decrease of employment by 20 to 25 per cent., as compared with October. Compared with the two best business months of last year, July and August, sales dropped by almost 40 per cent. Special complaints are made concerning the export trade. The total export of technical porcelain last year decreased by about 50 per cent. compared with the previous year, although it is claimed that prices brought hardly any profit.—*Financial News.*

Shop-window Lighting.—The accompanying illustration shows a good shop-window lighting installation which has recently been carried out at Villiers, Shaftesbury Avenue, W. "Siemens" shop-window reflectors, in conjunction with "Siemens" gasfilled lamps, are employed to obtain the

Siemens Shop-window Illumination.

desired effect, and the whole of the light is concentrated on the displayed models, &c., making them stand out in bold relief. The firm responsible for the work was Messrs. Edward Wolf & Co.

For Sale.—Messrs. Veryard & Yates will offer by auction on January 14th and 15th, at 31a, Camden Street, Camden Town, N.W., large quantities of ex-Government wireless, electrical, medical, and surplus stores, &c. Eastbourne Corporation Electricity Department has for disposal one 400-kW Ferranti engine and alternator. (See our advertisement pages to-day.)

Callender's in Germany. — The Callender Kabel Gesellschaft is the name of a new company which has lately been formed in Hamburg to handle the Callender cable productions in Germany.

Italian Tariff Reductions.—The *Board of Trade Journal* for December 31st contains a list of articles which are to be subject to lower rates of duty when imported into Italy from Germany, under the provisions of the recent commercial treaty between the two countries. By virtue of the treaty existing between this country and Italy, British goods will also be accorded the same treatment. The list includes small-gauge copper wires, internal combustion engines, "rotary hydraulic engines," portable steam engines, boilers and economisers, electric heaters, electromagnetic separators, electric soldering equipment, ammeters, electricity meters, recording meters, incandescent electric lamp bulbs, electric cars, ebonite, gutta-percha, &c.

A "Cosmos" Window Display.—The accompanying illustration shows a striking display which has been arranged for retailers of "Cosmos" lamps by Metro-Vick Supplies,

A "Cosmos" Lamp Display.

Ltd. The central piece is very attractive, being done in eleven colours and gold, with the lamp shade in red batik. At night it is illuminated by a concealed "Cosmos" lamp.

Unemployment in Germany.—The Berlin correspondent of *The Times* states that the official figures of unemployment in Germany during the first half of December showed a very sharp increase. The number of unemployed persons in receipt of State support was 673,315 on December 1st, and 1,057,031 on December 15th. So far, the state of trade offers no immediate prospect of an improvement, and the obvious political complications likely to arise from a continued period of widespread unemployment are giving rise to disquieting rumours that Government action similar to that taken in the winter of 1923 (which included the enforcement of a system of working short hours) is again contemplated.

German Machinery Exports to N.S.W. — The *Board of Trade Journal* states that during September last German dynamo-electric machinery to the value of £2,204 was imported into New South Wales.

United States Electrical Exports.—The total value of exports of electrical goods from the United States during October last was $7,567,087, a gain of more than $500,000 over the preceding month's figure, and about $700,000 in excess of the October, 1924, total. The increase is stated to be principally due to the rise in the exports of radio apparatus which were valued at $1,317,846, as compared with $769,249 in October, 1924. The other increases included a.c. generators and accessories, self-contained lighting sets, switchboard panels, fractional-h.p. motors, primary batteries, domestic appliances, wiring materials and accessories, lighting fittings, insulating materials, and ignition equipment. Among the classes which showed decreases were d.c. generators, transformers, large motors (above 200 h.p.), storage batteries, telephone equipment, and railway signalling equipment.

Proposed Japanese Amalgamation.—Negotiations are said to be in progress for amalgamating the Kabe Tramway Co. (with a capital of 1,500,000 yen), the Seto Inland Sea Orossing Electric Power Co. (capital 5,000,000 yen), the Shimane Electric Co. (capital 1,000,000 yen), and the Akana Electric Co. (capital 100,000 yen), with the Hiroshima Electric Co. (capital 30,000,000 yen). Being sister companies, it is thought to be comparatively easy to effect the amalgamation. Upon the amalgamation, the Kabe tramway will be electrified and hydro-electric and steam power stations will be erected. For this purpose, the amalgamation will increase its capital to 50,000,000 or 60,000,000 yen.

The A.E.G. in Mexico.—It is announced that the A.E.G. has formed a firm under the title of the A.E.G. Latein-Amerika Bau A.G., with a nominal capital of 50,000 marks, for business transactions in Mexico.

German Wire Syndicate.—The Berlin correspondent of the Exchange Telegraph Co. states that the German Wire Syndicate negotiations have been concluded by the accession of certain outstanding manufacturers. The syndicate has been formed for a fixed term of five years. The Siemens and Halske Co. has received a Belgian order for the construction of electric cables on the line Herbesthal-Brussels.—*Financial News.*

German Firm Secures Spanish Electrification Contract.—The Santander-Bilbao railway company has awarded a contract to a German firm for the electrification of the line from Bilbao to Las Avenas.—*Reuter's Trade Service* (Madrid).

Book Notices.—"The Colliery Manager's Pocket Book, 1926." Pp. 512+132; illustrated. Edited by J. Vincent Elsden, D.Sc. (Lond.) and Hubert Greenwell, F.S.S. London: The Colliery Guardian Co., Ltd.—The book is really a practical treatise on mining engineering dealing with the civil, mechanical and electrical branches separately and at considerable length. The part devoted to "Electricity in and about Mines" dwells chiefly on the plant and apparatus employed in mining, principally from the point of view of safety; the various rules and regulations concerned, including the I.E.E. wiring rules, are cited. A separate chapter is devoted to coal and its by-products, reviewing its origin and formation, as well as coal sampling and treatment. A review of the mining progress made during 1925 and various statistics relating to coal mines for the year 1924 add to the interest of the publication, while much general information, a diary, and cash account provision should prove useful.

"The Lubrication of Uniflow Steam Engines," Gargoyle Technical Series, No. 22 (12 pp., 6 figs.). London: The Vacuum Oil Co., Ltd.—This is a guide to the selection of lubricants for the type of engine named, having regard to its design, construction, operating conditions, &c.

"Water Resources Paper No. 45, Surface Water Supply of Canada. Atlantic Drainage (South of St. Lawrence River), New Brunswick, Nova Scotia, and Prince Edward Island. Climatic Years 1922-23 and 1923-24." Ottawa: F. A. Acland (for the Dominion Water Power and Reclamation Service).

"Memoirs of the College of Science, Kyoto Imperial University." Index of authors and contents of Vol. VIII, Series A, Vol. IX, No. 3; November, 1925.

"Japanese Journal of Physics; Transactions and Abstracts of the National Research Council of Japan." Vol. IV, No. 1. National Research Council, Department of Education, Japan.

"Preliminary Report on the Central Electric Station Industry in Canada, 1924." (Pp. 5.) Ottawa: Dominion Bureau of Statistics.—This report contains a general review of the supply industry in Canada with statistics of capacity, transmission systems, &c., and financial results.

"Science Abstracts" (A and B). Vol. XXVIII. Part 12. December 25th, 1925. London: E. & F. N. Spon, Ltd. Price 3s. each.

Quarterly *Bulletin* of the Institution of Engineers, Australia. Vol. II. No. 8. October 31st, 1925. Sydney: The Institution.

German Foreign Loan.—It is reported from Berlin that the Osram Gesellschaft is raising a 5 million dollar loan through a syndicate of Dutch, Swedish and British banks. The loan is to run for a period of 25 years at 7 per cent. interest.

The Argentine Electrical Market. — The French Commercial Attaché at Buenos Aires has been drawing attention to the Argentine market for electrical material. This, he points out, is large, although French manufacturers have not yet been able to gain much interest in it. The Germans and the North Americans dominate the position, and, in the view of the Commercial Attaché, it would be difficult to dislodge them. In order to obtain contracts from public authorities it is necessary to submit the material for the approval of the Technical Electrical Department of the Buenos Aires Municipality. In addition, the Tramways Company has its own specifications. The city of Buenos Aires is extending very rapidly every year, and there are now large districts under construction which no electric light system has yet reached. One-half of the city is to be rebuilt; the work has already commenced and will be carried out slowly, and it is evident that a very large amount of electrical material will be required. The average monthly sales of motors are estimated at between 2,500 and 3,000, of all sizes. Of this total it is calculated that between 1,200 and 1,250 go from the United States, 1,000 to 1,150 from Germany, 300 to 323 from Great Britain, 150 to 175 from Sweden, and only five from France. The United States' makers possess a great advantage through keeping stocks on the spot. The Germans are not far behind the Americans in their active search for electrical orders. To maintain stocks of machines and spare parts is of great importance, as no manufacturer is likely to equip his works with motors where such a service is absent. Although no definite regulations are laid down in connection with private installations, as a general rule concerns like banks and hotels insist upon tests similar to those laid down by the electrical department of the municipality. Although owing to the cheapness of certain sizes of German and American wires and cables direct competition is difficult, the Commercial Attaché considers that business is possible by cultivating relations with the wiring firms and maintaining stocks of wire and cable. For motors, the demand for a.c. and d.c. types is about the same, but as in Buenos Aires the use of d.c. motors for 220 V of more than 3 h.p. capacity is prohibited, a.c. types for 440 volts have a better sale. The squirrel cage design seems to be superseding the slip-ring motor.

New Indian Companies.—Among the new concerns recently formed in India in connection with the electrical engineering business are the International Electric Co., Calcutta (23, Strand Street), capital 100,000 rupees; and Seshasayer Bros., Trichinopoly, Madras, capital 100,000 rupees.

Lighting and Power Notes.

Australia.—WAGGA (N.S.W.).—The *Industrial Australian and Mining Standard* reports that at a recent meeting of the Municipal Council, the proposed agreement between the Council and the Public Works Department regarding the linking of Wagga with the Burrinjuck hydro-electricity scheme was discussed. Previously the council had given power to the mayor to sign an agreement, but as the result of the last meeting the council revoked this decision, and decided that a competent consulting electrical engineer should be engaged to report on the agreement generally.

TASMANIA.—Important amendments have been made in the Hydro-Electric Power Commission Bill (Tasmania). The primary object of the Bill is to place the control of the Hydro-Electric Department under a commission of three members. The Bill gives the Commission very wide powers regarding the development of the supply of hydro-electricity in the State, and the control of the distribution.

Bangor.—STREET LIGHTING.—With the object of facilitating the movement of traffic in the narrow High Street, Mr. Price F. White, the city electrical engineer, is carrying out a scheme of overhead lighting supplementary to the existing lighting arrangements.

Belgian Congo.—HYDRO-ELECTRIC SCHEME.—Additional information is now available with regard to the objects of the recently-formed Société Générale des Forces Hydro-Electriques de Katanga. It is proposed to construct a dam below the Lufira Falls, near Katanga, in the Belgian Congo and to establish a hydro-electric station for the supply of power to the Société de l'Union Minière. Following the completion of the plant, other falls are to be similarly utilised.

Birmingham.—PROGRESS DURING NOVEMBER.—At a recent meeting of the Electric Supply Committee continued progress during November was reported. New consumers connected totalled 1,031, this being the first time in the history of the undertaking that the additional connections have exceeded a thousand in a month. These additions represent in the aggregate 15,000 lamps and 1,900 h.p. for power supplies. The consumption of electricity for all purposes continues to be at the rate of nearly 20 per cent. above last year's figures.

ELECTRICAL DEVELOPMENT.—An important report has been issued by the Corporation Electricity Supply Committee on the development of the electricity undertaking involving an estimated expenditure of £478,000. The report states that the boiler plant is of sufficient capacity to deal with a further 10,000-kW turbo-alternator set, and in view of the growth of the demand in the area the Committee has come to the conclusion that it would be advantageous to install this extra plant forthwith so that it can be ready for service in time for next winter's load. The estimate of the cost of this additional set, together with the necessary foundations, piping, switchgear, cables, &c., is £60,000. It is recommended that the installation be proceeded with. The Committee has carefully reviewed the position with regard to the existing sub-station equipment, and the need for strengthening a number of the plants, and building and equipping other sub-stations in the area of supply, in order to give satisfactory service and meet the requirements for the next two years, as far as it is possible to gauge them, and has prepared a scheme which involves additional plant at six rotary converter sub-stations and the provision of five additional sub-stations in the Ward End, Acocks Green, Selly Oak, Bradford Street, and Granville Street districts, involving an estimated cost of £158,000. It is pointed out that £300,000, previously sanctioned, will have been expended on the distribution system by May, and to provide for further extensions of mains to the end of September next an outlay of £250,000 is necessary. A large amount of business is done with manufacturers requiring substantial power supplies from the e.h.p. mains, and to provide the necessary equipment it is estimated that £10,000 will be required during the ensuing twelve months.

Birkenhead.—NEW ELECTRICITY CHARGES.—The Corporation Electricity Committee proposes to introduce a new system of electricity charges based on the rateable value of dwellings. If it is approved by the Town Council at the January meeting the minimum rateable value assessment will be £18 per annum. Consumers will have the choice of two scales of charges (1) 5 per cent., of the rateable value of the premises, plus ½d. per kWh for all electricity consumed; or (2) 2½ per cent., of the rateable value, plus 1d. per kWh for electricity consumed. Consumers must have installed electric fires or cookers and for a house not exceeding a rateable value of £30 the minimum installed load apart from lighting must be 2 kW, increasing according to the rateable value of the house. The existing system of charges will be continued where desired.

Bristol.—CHANGE-OVER.—The Electricity Committee has decided to proceed with the third part of the scheme for the change-over of the system of supply in the Stoke Bishop, Coombe Wingle, Westbury, Neuleaze, Upper Redland, Broad Weir and Barton districts, at a cost of £103,061 for mains, £15,550 for sub-station buildings, and £45,620 for plant.

Canada.—HYDRO-ELECTRIC DEVELOPMENT.—Statistics giving the amount of hydro-electric power generated in Canada during the past three years show that during each month of the past year approximately 10 per cent. more was generated than during the same month of the previous year, and 20 per cent. more than during the year before. The average power generated monthly during the past year was 21 million kWh. De-

velopment work at the Chute-à-Caron falls on the Saguenay River, Quebec, on which the Aluminium Corporation is spending over $100,000,000, will be completed by the end of 1926, according to an official announcement. Nearly 750,000 h.p. will be available.—*Reuter's Trade Service* (Ottawa).

Cheadle and Gatley.—LOANS SANCTIONED.—The Urban District Council has received sanction to loans of £4,026 for the Adswood and Ladybridge Road electricity scheme, £9,097 on account of expenditure on mains and services up to March 31st next, and £3,670 for electricity extensions in Styal Road.

Continental.—SWITZERLAND.—It is reported that the Officine Elettriche Ticinese, of Bodio, has been authorised to export up to the end of 1931 a maximum of 400,000 kWh per day to the Società Lombarda per Distribuzioni di Energia Elettrica and the Società Idrolettrica Piemontese Lombarda Ernesto Breda, of Milan. From the end of 1931 to the end of the concession the quantity of energy to be exported will be reduced to a maximum of 304,000 kWh per day.

SPAIN.—A new hydro-electric station has recently been completed by the Sociedad Electrica Industrial del Jucar at Franco de Lobo in the province of Albacete. The plant comprises two 1,900-h.p. turbo-generators, and two 1,600-kVA 6,600/66,000-V transformers. The company has now four power stations, representing a total of 95,600 h.p. and is supplying electricity to Madrid and to the district between Sagunto and Cartagena.

Dover.—ELECTRICITY IN BULK.—The Electricity Committee has received a report from the electrical engineer regarding an inquiry from the Deal and Walmer Gas Co. as to a bulk supply of electricity to Deal, and the town clerk is to inquire if the company is prepared to enter into a contract for a period of 30 years.

Eastbourne. — ELECTRICITY EXTENSIONS. — The Electricity Committee has before it proposals for the installation of a turbo-alternator, a boiler, pipe work, &c., and a cooling tower, at an estimated cost of £41,548; also new feeder cables, substations, transformers, &c., at a cost of £11,123. Meanwhile application is to be made for sanction to a loan of £15,000 for future extensions.

Guiseley (Yorks.).—STREET LIGHTING.—The Urban District Council has decided to enter into an agreement with the Electrical Distribution of Yorkshire, Ltd., for conversion of the local street lighting from gas to electricity.

Heckmondwike.—ELECTRICITY IN SMALL HOUSES.—The Urban District Council has received sanction to a scheme for wiring houses for electricity and for payments for this work to be spread over a number of years. The charge for electricity under this scheme will be 1d. per kWh more than for consumers who provide their own piping and appliances. The scheme is aimed especially to encourage electric lighting in small houses.

Jamaica.—HYDRO-ELECTRIC DEVELOPMENT.—According to *The Times Trade and Engineering Supplement*, a Government Commission has recommended that an expert should be employed to estimate the cost of the hydro-electric scheme which the Kingston Municipal Corporation proposes to install to the north of Kingston. The Crown Agents were recently instructed to place the order for the hydro-electric plant in England, but in view of the appointment of a Commission to go into the reconstruction of Kingston's thoroughfares, extension of the sewerage system, and construction of a dam within the corporate area, the Crown Agents were advised to defer taking action in the above direction. The Commission has further advised the Government that details of cost of a hydro-electric plant, circuits, &c., required in modern street lighting, should be obtained from a centre such as Halifax, Nova Scotia, where an up-to-date system has been installed. It would be advisable, the report states, that the most modern system should be provided for the Corporation's scheme. The Commission feels that the amount provided by the Corporation for the lighting project is insufficient, hence the recommendation for expert advice.

Japan.—ELECTRICAL DEVELOPMENT.—The Nagoya steam power station of the Toho Nenryoku K.K. has been completed. The plant includes one 35,000-kW generator, one of 1,000 kW, and four Babcock & Wilcox boilers. Another generating set is being installed.

The Shibaura works of the Tokyo Municipal Council, which were destroyed by fire are to be re-built at a cost of 2,168,000 yen. Work will commence early this year.

An official explanation of the position of the Shinanogawa power station scheme has been published. According to the report it has been decided to construct two power stations on the Shiano River instead of one as originally planned, of which, one at Senju is to be completed in about three years commencing in the fiscal year of 1927-1928.

Eastern Engineering reports that the Hiroshima Electric Co. is shortly erecting its second Eno-gawa water power station in view of the increased demand. The station will have an output of 11,000 kW and will be completed by June, 1927. The company is also building a steam power station with an output of 25,000 kW as a stand-by.

It is understood that the Kuhara Mining Co. has decided to construct water-power stations of about 100,000 kW, on the Shokawa, in Giju and Toyama Prefectures.

Kendal (Westmorland).—STORM DAMAGE.—During the storm on December 30th a Diesel engine at the electricity works was put out of action and the electric cables fused. Fire broke out at the local gasworks, and the gas mains at the County Hall burst, fire also breaking out there. The town was entirely without light.

London.—STEPNEY.—The Electricity Committee has instructed the borough electrical engineer to submit estimates for laying distributing mains in streets where they have not already been laid.

Lytham St. Annes.—ELECTRICITY SUPPLY PROGRESS.—During November 63 additional electricity consumers were connected and owing to the increased demand another transformer sub-station, costing £620, is now required. A bulk supply of electricity from Preston is promised for October next by which time an additional rotary converter will be added at the St. Annes station at a cost of £2,211.

Manchester.—LOANS SANCTIONED.—The Electricity Committee has received sanction to loans of £18,000 for buildings, and £32,000 for sub-station equipment.

Newport.—MAINS EXTENSIONS.—The Borough electrical engineer has prepared plans for the extension of mains at a total cost of £17,000.

Pwllheli. — ELECTRICITY SCHEME APPROVED. — The Town Council has decided to approve of the proposal of the Electricity Distribution of North Wales & District, Ltd., to supply electricity to the town. The transmission line has already reached the borough, and the Electricity Commissioners had threatened to dispense with the Council's consent unless it withdrew its claim for a deposit as security from the company.

Salford.—ELECTRICITY SUPPLY.—The Electricity Committee has recommended to the Corporation that application be made for sanction to a loan of £132,333, to cover the cost of mains and services in Salford and Prestwich, the erection and equipment of sub-stations, the provision of plant at Frederick Road power station, &c. The contract rates for the supply of electricity for motive power in the Urban District of Prestwich have been fixed at 5 per cent. above the contract rates in force in Salford.

Seaham Harbour.—ELECTRICITY IN BULK.—At a recent meeting of the Urban District Council a further report on the electricity scheme was considered, and it was agreed that the offer of the County of Durham Electrical Power Distribution Co. to supply power in bulk should be accepted. A Special Order has been applied for.

Special Orders.—The Electricity Commissioners have submitted to the Minister of Transport for confirmation a Special Order made by them authorising the St. Helens Corporation to supply electricity in part of the rural district of Whiston.

Applications have been made for Special Orders by the following authorities:—The Windsor Electrical Installation Co., Ltd., for the repeal of the New Windsor Electric Lighting Order, 1895, and part of the New Windsor (Extension) Order, 1920, for the cancellation, or amendment, of agreements between the New Windsor Corporation and the Company, and for authority to supply electricity in the borough of New Windsor, and the urban district of Eton; Mr. J. A. Purves, for the supply of electricity in the urban district of Bungay.

Stirling.—ELECTRICITY SUPPLY.—An application has been made by the War Office for a supply of electricity for Stirling Castle which is used as a barracks. According to the electrical engineer the cost of giving a supply by a feeder cable will be £980 and the probable revenue about £300. In addition to lighting, a large electric cooker may be installed. The electrical engineer is negotiating with the War Office regarding the matter.

Swansea.—WIRING OF SMALL HOUSES.—The Electricity Committee has adopted a report submitted by the borough electrical engineer (Mr. J. W. Burr) on the extension of the corporation's "free-wiring" scheme to property other than that owned by the Corporation. He proposed that the committee should extend the "free wiring" scheme to all properties having a ratable value not exceeding £20 per annum, providing that not less than ten houses are supplied from one service; that the consumers agree to pay 2d. extra per kWh for the first 50 kWh consumed per annum, for a given number of points (five), any additional points being allowed but a *pro rata* increase in the number of kWh to be paid at the higher rate to be made; ordinary meter rents to be charged; and the minimum consumption be ten kWh per point per annum.

Warwick.—POWER STATION FLOODED.—According to the daily Press, the recent heavy rainfall caused the River Avon to overflow. The Corporation power station was flooded and the electricity supply was cut off on January 2nd. The tramway service was also brought to a standstill.

Watford.—LOAN SANCTIONED.—The Electricity Committee has received sanction to a loan of £10,669 in connection with the extension of the electricity supply to Bovingdon.

Wellington (Salop).—OBJECTION TO ORDER.—The Urban District Council has decided to raise objections to the application of the local Gas Company for an Order to supply electricity in the district on the grounds that the charges stated in the company's application are considered excessive, and that the Council holds an Order for the supply of electricity and is prepared to give a supply as soon as a bulk supply is available.

Wrexham.—LOAN.—The Town Council has applied for sanction to a loan of £12,000 for mains services, distribution feeders, underground boxes, switchgear, and transformers.

Tramway and Railway Notes.

Australia.—SYDNEY (N.S.W.).—According to the *Industrial Australian and Mining Standard*, the New South Wales Government has officially announced that the section of the Sydney city railway from the Central Railway station to St. James' station will be open for traffic in June of next year. The other extensions to Circular Quay, and thence along the western side of the city, are expected to be completed within five years to synchronise with the opening of the harbour bridge. It is proposed to push ahead with the work on the western side of the city before completing a section at a point near Bridge Street to Circular Quay. A start on the latter section, which is estimated to cost £200,000, will be made in about two years, when, it is considered, this section can be completed at the same time as the other sections. When the railway is finished, there will be five stations, namely, Museum, St. James', Quay, Wynyard and City. Later it is proposed to make further extensions. The eastern suburbs train will pass through St. James' station, and thence round the city to the City station. It is also proposed that at some future period the line shall be extended from the City station to North Strathfield. The idea is to give a service to Haberfield, Drummoyne, Hunter's Hill, and Ryde districts, lying midway between the Main Western suburban line, and the North Shore line.

Birmingham.—TRAMWAY IMPROVEMENTS.—The Corporation tramways department proposes to enlarge its tramcar service by purchasing 30 additional tramcars at an estimated cost of £75,000; and to build a new depôt to accommodate 105 cars at Selly Oak at a cost of £51,000.

Continental.—ITALY.—With a view to meeting the competition of North Sea ports, an agreement has been arrived at between the Transalpine Association and the railway companies concerned in Italian-German freight traffic for the development of the line between Venice and Munich. Contracts will shortly be signed for the electrification of the whole line on the Italian side, the German section between Munich and Kufstein having already been partly electrified. Italian engineers have started the electrification of the stretch from Brenner to Bozen; this will leave only the line from Bozen to Verona and from Verona to Venice (or from Trent to Venice) unelectrified. When the whole work has been completed, the time of the journey between Venice and Munich will be considerably shortened.—*Reuter's Trade Service* (Venice).

Japan.—RAILWAY ELECTRIFICATION.—The Minobu Railway's Ichikawa-Marutaki line is to be completed in about May, 1927, and will be opened to traffic a few months after that date. The line is to be electrified. The Marutaki-Fuji line of the railway, which has already been constructed, is also being electrified, and the work will be completed by about August, 1926. For the first-named line the necessary energy will be obtained from the Hayakawa Hydro-Electric Co., but it is reported that the company is considering the establishment of its own plant by harnessing the Fukushi, Tsuncha, and Fuji rivers. The scheme for the construction of an electric railway between Maita, Yokohama and to Misaki is progressing steadily; the cost is estimated at 13,000,000 yen.

Llandudno.—GREAT ORME TRAMWAY.—The *Electric Railway and Tramway Journal* reports that the Llandudno Urban District Council has decided not to exercise its option to purchase, in 1926, the undertaking of the Great Orme Tramway Co., which was opened 26 years ago. Proposals are on foot for the electrification of the tramway.

Salford.—TRAMWAY AGREEMENTS.—The Corporation Tramways Committee has decided to enter into an agreement with the Eccles Corporation with respect to the maintenance of the overhead electrical equipment of the Eccles tramway, for a term of 14 years from March 31st last. The Committee has recommended a scheme for the interchange of traffic with the Bury Corporation so as to permit of the through-running of Salford tramcars to the Bury market place and of the Bury Corporation tramcars to the Victoria Bridge terminus of the Salford system.

United States.—CINCINNATI.—According to the *Electric Railway Journal* submission of a bond issue to extend the rapid transit subway at Cincinnati, Ohio, into the centre of the city is being considered by the Rapid Transit Commission. A tentative estimate made by the engineer in charge of construction more than a year ago placed the cost of the proposed extension at $1,500,000, but that figure now is deemed inadequate because of higher cost of material and labour. The engineer has informed the Commission that the subway will be ready for the laying of the track as far as Norwood next spring, but that the extension in Oakley cannot be made unless additional funds are provided. It was announced that as soon as the subway was ready for operation the street railway would operate 'buses as feeders for the system.

RAILWAY ELECTRIFICATION.—According to *Electric Traction*, the proposed hydro-electric development at Lake Chelan, in connection with the electrification of the Great Northern Railway, work on which will commence as soon as plans are approved by the Federal Power Commission, is expected to result eventually in the electrification of the Great Northern line through the Cascades and for 400 miles eastward. The contract for the construction of the dam and plant has already been placed with the Washington Water Power Company.

Telegraph and Telephone Notes.

Belgium.—NEW TELEGRAPH CABLES.—The orders for the new cables, to which reference was made in this column last week, have been placed to the value of some 62,500,000 fr. with the Ateliers de Constructions Electriques de Charleroi, and with the Siemens & Halske Co., of Berlin, for the amount of 27,000,000 fr.

WIRELESS FOR FISHING BOATS.—In its report for the last financial year, the Société Ostendsche Reederij states that, as a result of experiments carried out by the Compagnie Internationale T.S.F. with wireless telephone apparatus capable of receiving and transmitting messages up to a distance of nearly 100 miles, it has been decided to equip the entire fleet of fishing vessels owned by the Company with such apparatus.

Empire Communication.—RUGBY STATION.—The high-power Government radio-telegraph station at Hilmorton, near Rugby, was opened for general traffic on January 1st. Its call sign is GBR and the wave-length is 18,000 metres, control being by land line from the Central Telegraph Office in London.

New Radio Services.—MARCONI AGREEMENT.—As a result of an agreement signed between Marconi's Wireless Telegraph Co., Ltd., and the Postmaster-General, on December 31st, the Company is now licensed to conduct services with Denmark, Sweden, Finland, Russia, Portugal, Jugo-Slavia, Bulgaria, Turkey, and Greece, and with all foreign countries outside Europe, in addition to present services. The Company hopes to establish "beam" services from England to Canada and South Africa in April, and India and Australia in August.

Storm Damage.—Following snow and ice before Christmas, recent gales and flood water have dislocated overhead lines of communication all over the country: On the Continent, too, the same conditions obtain; not for many years have storms wreaked such havoc among telegraph and telephone communications in France and Western Europe. Thirty-six large French towns have been totally isolated, while at one time 350 telephone lines to Paris were not working, Brittany being particularly affected.

Radio Notes.

India.—NEW COMPANY.—There is every prospect of a company being registered in January under the Indian Companies Act for the establishment of a broadcasting service in India, says the *Morning Post*. It was in March last that the Government of India announced its willingness to issue a licence to such a company for a period of ten years, and for the first five years of its licence the company was to have a monopoly of broadcasting. So far as can be ascertained, only one application was received for the broadcasting licence, and the Government has recently modified its conditions.

Irish Free State.—FIRST BROADCASTING STATION.—The first broadcasting station in the Free State at Dublin commenced operations on January 1st. It is owned by the Government and works on a 390-metre wave-length; its call sign is 2RN and its plant was supplied by the Marconi Co.

Licences.—STEADY INCREASE.—Since the Postmaster-General's first warning in August, 1925, that listeners who do not take out licences for their receiving sets run a risk of being prosecuted, more than 150,000 additional licences have been taken out, and there have been many prosecutions. According to the *Daily Mail*, the number of licence holders has increased as follows:—August, 1,423,000; September, 1,464,500; October, 1,509,520; November, 1,574,732.

PROSECUTIONS.—Tudor Laurence, of the Royal Aircraft Establishment, Farnborough, was fined £1 on December 31st for installing and working a two-valve set without a licence, and Frederick Blay, of North Kensington, was fined 15s. at West London Police Court on the same day, when he pleaded guilty. Three listeners living in Rotherhithe were recently fined at Tower Bridge for using crystal sets without licences, A. J. Jarvis, of Stratford, E., was fined £1, with £1 1s. costs, at West Ham on January 4th, and several other cases have been before the Courts.

Salvador.—NEW STATION.—The 500-watt broadcasting station which has been built by the Government Telegraph and Telephone Division was expected to commence operations at the end of 1925, says *Commerce Reports*. Its wave-length will be between 400 and 500 metres.

Siberia.—NEW STATION.—The Westinghouse Electric and Manufacturing Co., of East Pittsburgh, Pa., U.S.A., has recently secured an order for a 20-kW broadcasting station for Vladivostock, Siberia.

Spain.—NEW STATION.—A contract has been entered into betwen the Government and the Compañia Ibérica de Telecommunicacion, of Madrid, for the erection of a broadcasting station at Málaga, the cost of which is estimated at between 50,000 and 70,000 pesetas. Although Málaga will not become a general distributing centre, the new station is expected to create a demand for radio equipment both in the adjoining provinces and in Spanish Morocco.—*Reuter's Trade Service* (Madrid).

Sweden.—NEW STATION.—According to *Commerce Reports*, during the past year over 100,000 receivers' licences have been issued, and it was expected that the figure would reach 120,000 before the close of 1925. The Royal Swedish Telegraph Administration has prepared a report on the radio situation, and has requested an appropriation of 1,050,000 crowns for the erection of a large broadcasting station to be located in the central part of Sweden. It is said that this station will broadcast on a 1,350-metre wave-length. Calculations show that approximately 2,000,000 persons live within a radius of 200 kilometres of the proposed site, and it is expected that the station will increase the number of receivers' licences issued by about 70,000.

Time Signals.—FRANCE.—Following the resolutions that were adopted at the International Time Commission at Cambridge in July, 1925, certain changes were made in the transmission of time signals from radio stations in France on January 1st. In May next another change will take place.

SPAIN.—The Radio Barcelona Co. proposes to establish a luminous time service by means of an electric lantern on one of the pylons which it has erected at Tibidabo, near Barcelona, to support the aerial recently installed for the new large station. In this way nearly all the province of Barcelona will be able to regulate its watches and clocks. The company is studying means of retransmitting the Eiffel Tower time.—*Reuter's Trade Service* (Madrid).

Transatlantic Tests.—The third annual transatlantic broadcasting tests will commence on Sunday night, January 24th. Canadian, American, Mexican, and Cuban stations will transmit from 3 to 4 a.m., G.m.t., every night throughout the week, following which British and Continental stations will transmit from 4 to 5 a.m., G.m.t.

United States.—RADIO INDUSTRY.—Mr. David Sarnoff, general manager of the Radio Corporation of America, in an address to the Boston Chamber of Commerce, said that statistics prepared by the Radio Corporation indicated that the business done by the radio industry in 1925 would aggregate approximately $350,000,000.—*Reuter's Trade Service* (Boston).

NEW STATION.—The Bound Brook station, the transmitting station of the Radio Corporation of America, was opened officially on January 1st, and, in connection therewith Daventry broadcast special greetings to America, which were picked up at Belfast (Maine) and relayed from there to all the associated American stations.

Accidents.—Following a breakdown early in December due to the aerial snapping under the weight of ice, the Daventry station of the British Broadcasting Co. has had five other mishaps, one of which was due to the interruption of power from the generators to the transmitter and another to a fault in the oscillator valve cooling-water system. The Birmingham station ceased operating for some time recently owing to a fire on the floor above the studio, while the London station has stopped transmitting for a few minutes on two occasions since Christmas. During the night of December 30th the smaller of the aerials on the Eiffel Tower, Paris, was carried away in a gale.

Contracts Open and Closed.

(The date given in parentheses at the end of the paragraph indicates the issue of the "Electrical Review" in which the "Official Notice" appeared in our advertisement pages.)

Open.

Army Contracts.—Manufacturers who are not already on any War Office list of tenderers and who may wish to tender for Army requirements of cables, electrical stores, scientific instruments, &c., should apply to the Director of Army Contracts, Caxton House (West), Tothill Street, Westminster, S.W., for Form 1, on which formal application for inclusion on the list of tenderers may be made. (See this issue.)

Australia.—MELBOURNE.—March 16th. Postmaster-General's Department. Battery-charging power board equipment.*

March 29th. State Electricity Commission. Transformers and auxiliary apparatus.*

Batley.—Installation of electric lighting at two West Ardsley branch stores of the Batley Co-operative Society, Ltd. Secretary.

Birmingham.—January 9th. Tramways Committee. 50 tramcar bodies. Forms of tender (£2) from Mr. A. Baker, general manager, Tramways Offices, Birmingham.

Blackpool.—January 23rd. Electricity Department. One 2,500-kVA phase and frequency changer. (January 1st.)

Bradford.—January 11th. Tramways Committee. Supply of electric trolley vehicles. Specifications from Mr. R. H. Wilkinson, general manager, Corporation Tramways, 7, Hall Ings, Bradford.

Croydon.—January 11th. Tramways Department. 12 sets of electrical equipment for tramcars. (January 1st.)

Dewsbury.—January 23rd. Town Council. Reciprocating electrically-driven sludge pumps with motors and electrical equipment for Mitchell Laithes sewage disposal works. Specification from Mr. H. Dearden, borough engineer, Town Hall.

Dundee.—January 15th. Harbour Trust. Electric lighting installation at New Wharf. Schedules from Mr. J. Hannay Thomson, general manager and engineer.

Eastbourne.—January 9th. Electricity Department. 12 months' supply of h.p. and l.p. paper-insulated cable. January 25th. One 2,500-kW turbo-alternator, with condensing plant and pipework, one water-tube boiler and economiser, feed heaters and piping, one water-cooling tower. (January 1st.)

Egypt.—CAIRO.—January 16th. Chief Electrical Engineer, P.W.M. Three passenger lifts at the Egyptian State Telephones and Telegraphs Building, Cairo.—*Reuter's Trade Service* (Cairo).

Chief Inspecting Engineer in London, Queen Annes Chambers, S.W. Supply of miscellaneous spares for electrical material, &c.—*Reuter's Trade Service* (Cairo).

Honley (near Huddersfield).—January 11th. Electrician's work at the premises, The Bridge, of Honley Industrial Equitable Co-operative Society, Ltd. Quantities from Mr. E. Heaps, secretary, Westgate.

Ilford.—The Electricity Committee has decided to invite quotations for an additional 1,000-kW La Cour converter and switchgear and a 500-kW rotary converter.

Ilkley.—January 20th. Electricity Department. Feeder cables, distribution cables, feeder pillars, and network boxes. (January 1st.)

Liverpool.—Corporation Waterworks. Pumping plant, consisting of a high-lift, electrically-driven, verticle-spindle centrifugal pump at the Dudlow Lane pumping station. Specification (2 guineas) from Mr. J. R. Davidson, water engineer, 55, Dale Street, Liverpool.

London.—SHOREDITCH.—January 27th. Electricity Department. One 50,000-lb. water-tube boiler, with economiser, forced and induced draught, &c.; one 10,000-kW turbo-alternator, with condenser, pumps, &c. (December 25th.)

BETHNAL GREEN.—January 19th. Board of Guardians. Three Lancashire boilers for the hospital, Cambridge Road. Specifications, &c., from Mr. C. F. Jones, clerk to the Guardians, Bishops Road, Bethnal Green, E.

METROPOLITAN ASYLUMS BOARD.—January 27th. Installation of electric lighting at the Darenth Colony, Dartford (approx. number of points, 2,300).

E.C. January 30th. Marryat & Place. 113,000 5-amp., 220-V, tumbler-type electric switches. (See this issue.)

LONDON COUNTY COUNCIL.—January 25th. 4,425 tons of standard steel girder tramway track rails, fishplates and fishbolts, and about 600 tons of conductor rails. Specifications from the Chief Engineer, Old County Hall, Spring Gardens, S.W.

Manchester.—January 12th. Tramways Committee. Steel girder tramway rails. Mr. H. Mattinson, general manager and chief engineer, 55, Piccadilly, Manchester.

New Zealand.—WELLINGTON.—March 2nd. Public Works Department. Synchronous condenser and transformers for the Arapuni electric power scheme.*

30,000-V switch and protective apparatus for Lake Coleridge electric power supply.*

March 8th. New Zealand Government Railways. Two 25-h.p. variable-speed motors, one 125-kW motor-generator set and 17 400-V, 3-pole switches.*

DUNEDIN.—February 26th. Otago Harbour Board. Motors, control gear, and cable.*

Rumania.—BUCHAREST.—February 4th. Rumanian State Railways. Porcelain insulators, sleeves, and plates.*

Sheffield.—January 18th. Electric Supply Department. Erection of stores, ambulance room, on site of Neepsend generating station, Club Mill Lane. Particulars from Mr. S. E. Fedden, general manager and engineer.

South Africa.—JOHANNESBURG.—January 21st. Municipal Council. 106 current transformers.*

February 26th. Motor-driven air compressor, with electrical equipment.*

S.A. RAILWAYS AND HARBOURS. February 25th. Electrically-operated hoists for raising, &c., heavy locomotives, electrically-driven geared winches, &c.*

CAPE TOWN.—January 27th. Electricity Department. Oil-cooled transformers.*

Thurnscoe.—January 12th. West Riding Education Committee. Electric lighting installation at new school. Specifications from Education Department, County Hall, Wakefield.

Walthamstow.—January 27th. U.D.C. Electricity Department. Two water-tube boilers, mechanical stokers, economisers and pipework, &c. (See this issue.)

*Further particulars can be obtained at the Department of Overseas Trade (Inquiry Room), 35, Old Queen Street, S.W.1.

Closed.

Bolton.—Education Committee. Accepted:—
Electric lighting installation at the new Devonshire Road Council Junior Mixed School.—James Morris.

Chorley.—Education Committee. Recommended:—
Electric lighting at school clinic.—Fisher & Co.

Hastings.—Electricity Committee. Recommended:—
H.p. switchboard (£460).—Ferguson, Pailin, Ltd.

Ilford.—Electricity Committee. Accepted:—
440 yd. .25 triple concentric cable (£330).—Hackbridge Cable Co., Ltd.

Tramways Committee. Recommended:—
200 tons of rails (£2,055); 200 pairs fishplates (£2,755).—Cargo Fleet Iron Co., Ltd.

India.—EASTERN BENGAL RAILWAY.—Accepted:—
Three 2-operator motor-generator electric arc-welding plants.—Alloy Welding Processes, Ltd.

Lamp Contracts.—The London and North-Eastern Railway Co. has placed contracts for the supply of train-lighting lamps with Edison Swan Electric Co., Ltd., and Metro-Vick Supplies, Ltd.

Contracts for 12 months' supply of "Mazda" electric lamps have been placed with the British Thomson-Houston Co., Ltd., by the London & N.E. Railway Co., the Dublin United Tramways, and the Aberdeen Line; the Siemens and English Electric Lamp Co., Ltd., has received a contract for the supply of vacuum and gasfilled lamps for one year from the Booth Steamship Co., Ltd.

Manchester.—Electricity Committee. Accepted:—
No. 10 boiler unit (equipped for pulverised fuel firing).—Babcock and Wilcox, Ltd.; sub-contractors: Motors, Lancashire Dynamo and Motor Co., Ltd.; fans and grit catcher, Davidson & Co., Ltd.
(The plant includes the following sections:—Boiler (130,000 lb. per hour), superheater, economiser, air heater, combustion chamber with water-cooled walls, pulverisers and driers, draught plant, grit catcher and chimney, pipework, tools, and spares.)
A.c. motors for High Street depôt.—F. & A. Parkinson, Ltd.
Two 500-kW fully-automatic rotary converters for Burnage sub-station; two ditto for Blackley sub-station.—Harland Engineering Co., Ltd.
Electrical storage battery.—Tudor Accumulator Co., Ltd.

Education Committee. Accepted:—
Electric lighting, Burnage and St. Phillip's schools.—A. E. Sudlow & Co.

Tramways Committee. Accepted:—
Special trackwork.—Edgar Allen & Co., Ltd.; Hadfields, Ltd.; and Titan Trackwork Co., Ltd.
One steam meter.—Electro Flow Meter Co.
Belt sander.—Abur Machinery Co., Ltd.
Bosch stationary potential and lighting dynamos.—John Roberts.
Span-wire brackets.—John Spencer, Ltd.
Electric welding plant.—Equipment and Engineering Co., Ltd.
One 600-V "Erico" welder.—Forest City Electric Co., Ltd.

Preston.—Electricity Committee. Accepted:—
H.p. switchgear (£4,928).—Metropolitan-Vickers Electrical Co., Ltd.
Steam piping (£1,645).—Babcock & Wilcox, Ltd.
Materials for outdoor sub station (£238).—British Insulated Cabels, Ltd.

Sowerby Bridge.—U.D.C. Accepted:—
Electrician's work required in connection with the first batch of 20 scullery houses.—Oakley, Green & Wilson.

Sheffield.—The Electric Supply Committee has extended its contract with the British Electric Transformer Co. to include one oil-cooled 1,000-kVA Scott-connected transformer, one ditto, 500-kVA, two ditto, 250-kVA, and 10 ditto, 100-kVA, at a total cost of £3,069.

Salford.—Electricity Committee. Accepted:—
Supply of the undermentioned cable:—1,000 yd. .0025 sq. in. l.p. concentric paper-insulated, lead-covered cable (£108); 500 yd. .1 sq. in. ditto ditto (£117); 1,000 yd. .2 sq. in. ditto ditto (£368); 1,000 yd. .0025 sq. in. l.p. twin ditto ditto (£97); 500 yd. .01 sq. in. l.p. 3-core ditto ditto (£50); 500 yd. .0225 sq. in. ditto ditto (£59); 1,000 yd. .06 sq. in. ditto ditto (£212); 1,000 yd. .12, .06, .12 sq. in. ditto ditto (£308); 500 yd. .25, .25, .25, .12 sq. in. ditto ditto (£356); 500 yd. e.h.p. .1 sq. in. concentric paper-insulated, lead-covered cable (£116). Total, £1,792.—Nederlandsche Kabelfabriek (Holland).

Smethwick.—Education Committee. Accepted:—
Electric lighting installation at new secondary school (£1,095).—Henry Hope & Sons, Ltd.

Watford.—Electricity Committee. Recommended:—
5,000-V turbo-alternator (£22,000).—Brush Electrical Engineering Co., Ltd.
Two boilers, superheaters, &c. (£11,000).—Vickers, Ltd.

York.—FOREIGN ELECTRICITY PLANT.—At the meeting of the City Council on Monday last, Ald. Wragge moved that the decision of the Council to purchase a 6,000-kW turbo-alternator for £19,000 from Oerlikon, Ltd., be rescinded. After considerable discussion the motion was defeated by 24 votes to 8.

The "Electrical Review" Service Department.

INQUIRIES must be accompanied by a stamped addressed envelope.

We should be glad to learn the names and addresses of makers of the following:—

KRYPTOL high-resistance powder.
Imitation coal, as used in electrical fires.
BILT-RITE American electric drills. (British agent's name wanted.)
Plaster indirect lighting fittings.

Reviews.

The Principles of Sound Signalling. By MORRIS D. HART, M.Sc., D.I.C., A.M.I.E.E., and W. WHATELY SMITH, M.A., M.Sc. Pp. 140; 14 figs. London: Constable & Co., Ltd. Price 12s. 6d. net.

In this work the authors deal with the production, transmission, and reception of sound on a purely scientific basis, bringing together in a convenient form the results of experimental and analytical research, some of which have been previously published elsewhere. First discussing the efficiencies of a system under the three heads above-mentioned, they point out that under the conditions obtaining in practice it is preferable to use a "figure of merit" for the performance of the system, and show how it assists the engineer in comparing and improving the apparatus employed. Commencing with reception, they proceed to consider the appliances available for the detection and intensification of sound waves; dealing with transmission, they reprint a paper from the *Proceedings* of the Royal Society, in which experiments with the hot-wire microphone were described and fully discussed, leading to the conclusion that "one of the essentials for the efficient production of sound is the avoidance, as far as possible, of a high intensity at any point within the system." In the following chapter the influence of the humidity and temperature of the atmosphere on transmission is briefly described, after which two chapters are devoted to the conditions prevailing at the source and to the apparatus available for sound production, of which the centrifugal siren is said to meet the requirements of theory most satisfactorily. Finally the whole problem is briefly reviewed in the light of the investigations described. Five appendices deal with specific aspects of the subject. The work is suitable for the use of those engaged in research, to whom it will be of great value, going far towards placing this very difficult subject on a basis of precision and clarity.

A Practical Treatise on Fourier's Theorem and Harmonic Analysis for Physicists and Engineers. By ALBERT EAGLE, B.Sc., A.R.C.Sc. Pp. xiv + 178; figs. 25. London: Longmans, Green & Co. Price 9s. net.

This book, written primarily for physicists and engineers, constitutes an endeavour "to give a fairly complete account of the practical method of analysing any given curve or set of observations into its harmonic constituents, if it be a periodic function, and of detecting any periodic component in it if it is not a periodic function," and we think we may safely say that the author has succeeded in this. It is written within the bounds of the elements of trigonometry and the calculus and an introductory chapter is presented on imaginary quantities, and a few theorems on the integrals and sums of trigonometric expressions, in order to clinch the matter. We think the author would have been better advised to use the modern j for the symbolic operator instead of i, particularly as the latter is now the accepted symbol for current in electrical engineering theory. Chapter I deals with periodic functions in general, which for the purposes of the practical mathematician, the author divides up into what he terms (*a*) analytic or natural functions, (*b*) artificial functions, and (*c*) empirical functions; the treatment is extended to cover four special classes of periodic functions, namely, sine-harmonic, cosine-harmonic, odd-harmonic and bi-symmetric functions. Chapter II opens with the statement of Fourier's Theorem and proceeds to a simplification of it for the four special classes enumerated above, from which the names given to the special classes are evident. Some examples of applications to electrical engineering theory are given, these embracing studies of the terminal voltage of a three-phase generator, the voltage wave form of an alternator of given field form, the R.M.S. value of a periodic curve and the form factor. We should like to have seen more similar examples which would, we are convinced, have been particularly interesting and useful to the electrical designing engineer. Chapter III treats of the representation of artificial functions by Fourier's series or more briefly and colloquially of harmonic analysis. This chapter first works out seven problems on the harmonic analysis of different even and odd functions, passing on to a short treatment of the differentiation of a Fourier's series and thence to a study of five further problems in wave form analysis; finally it deals with the problem of obtaining a general formula for the Fourier constants in terms of the discontinuities of a periodic function.

Chapter IV deals with the representation of periodic analytic functions by Fourier's series, and three typical problems upon this are worked out. An example is worked through in detail dealing with the direct summation of Fourier's series. Chapter V discusses the representation of empirical functions by Fourier's series, the first part being devoted to a study of the simplest Fourier series of a curve passing through 2p points per period. The author then proceeds to consider the construction of schedules which facilitate the determination of the harmonic analysis, and three sets of representative schedules are given. A graphical method of harmonic analysis is next given, while subsequently the chapter deals with the error of harmonic analysis, the determination of the amplitude of any selected harmonic, a simple method of harmonic analysis, a new method of harmonic analysis, and finally, interpolation formulæ for periodic functions. The theory of Fourier's series is described in detail in Chapter VI which, the author points out, may be entirely neglected by those whose interest in the subject is purely practical, but we think the serious student would make a mistake in doing this. The chapter

deals with one or two theorems on the convergence of infinite series, the relation between the Fourier co-efficient and the properties of a function, the convergency of a Fourier series and proof of Fourier's theorem by direct summation of the series.

Chapter VII, which is intended for the student of physics, deals with Fourier's integral theorem, which is first worked out in detail and which is subsequently shown to hold good provided the integrals are convergent. The theorem is shown as applied to odd and even functions, and one or two examples in physics are given of its applications.

Chapter VIII indicates the procedure to be adopted for the search for periodicities in observed data which is not periodic, and a simple way of applying the method recommended in practice is given. The treatise concludes with a brief historical survey of the subject in Chapter IX. The volume can well be recommended to mathematical students and to engineers mathematically inclined, but in a future edition we should like to see more attention devoted to graphical and tabular methods which would permit the average designing electrical engineer to obtain the desired results in a minimum amount of time.

Dynamo-Electric Machinery. By ERICH HAUSMANN, Sc.D. Pp. viii + 645; figs. 447. London: Crosby Lockwood and Son. Price 21s. net.

Professor Hausmann's book supplants Sheldon's D.C. Machines and A.C. Machines, published first over 20 years ago. As students we disliked these books. The present attempt to embody in one volume of some 600 pages "The Theory, Construction and Operation of Direct and Alternating Current Machines" is a much better effort. Text books such as this, intended for use in technical educational institutions, must be considered and judged by their value to students. It is difficult to envisage any one type of student for whom the method of treatment adopted here would be considered satisfactory. For the beginner, the space given to electrical laws and facts is inadequate, extending as it does to one short chapter of 23 pages. Magnetic laws and facts set out in the next chapter receive the same scanty treatment. The sections on structural elements of a dynamo then introduce direct-current machines, but the elementary student cannot be brought up to this stage on these summaries of electrical theory; while for the more advanced man, who has a good knowledge of this groundwork, they are unnecessary in a treatise on dynamo-electric machinery. The section of the book dealing with direct-current machines comprises chapters on armatures, field magnets, armature reaction and commutation, generators and motors. The characteristics and applications of the several types are adequately discussed, but some account should surely have been included of machine testing, even if descriptions of car-lighting equipments, automobile motors and many of the rather meaningless half-tone block illustrations had perforce to be omitted. The chapters on alternating-current theory carry the reader rather rapidly from the consideration of the production of a sine-wave, e.m.f., alternating current, power, &c., to the calculation of instantaneous current values in reactive circuits, the natural frequency of damped circuits and harmonic wave analysis. The mathematical equipment of the student for whom the greater part of the book would seem to be designed is likely to be too undeveloped for a proper appreciation of the subject matter here. A simple exposition of polyphase working, the relationships between phase and line values of voltage and current, together with polyphase power measurement is reserved for inclusion in the chapter on alternators, where it is interpolated between sections on wave shape and the rating of alternators. A satisfactory chapter is devoted to transformers, which gives their theory, method of testing, modern constructional methods and circuit connections. This chapter, however, should have come after and not before two-phase and three-phase working had been explained. Alternator construction, voltage regulation and its pre-determination, with a short account of the conditions of parallel running, are contained in one chapter, while that following is deemed sufficient for the disposal of all types of alternating-current motors. Herein induction motors are accorded a fairly liberal treatment, which includes explanations of the circle diagram and its experimental determination. The final chapter of 50 pages is little more than a summary of letter-press, diagrams and photographs of dynamotors, motor-generators, balancers, boosters, rotary converters, mercury vapour and thermionic valve rectifiers. A feature to be commended here, as in other American books, is the provision at the end of every chapter of a number of appropriate numerical problems. If the answers had also been supplied, the usefulness of these questions to the student relying on his own reading would have been increased. The book contains much valuable and advanced information, but it has scarcely the arrangement or completeness of a text-book.

Volta Centenary.—An international electro-technical congress, which will be attended by electrical engineers from all countries, will be held at Como in 1927 to commemorate the first centenary of the death of Alessandro Volta, the physicist, who died at Como on March 5th, 1827. Count Alessandro Volta (1745-1827), the Italian physicist, was born at Como, and afterwards became Professor of Physics there. He made many important discoveries in electricity. He produced the first voltaic battery, and his name is commemorated in this invention.

Forthcoming Events.

Society of Engineers.—Friday, January 8th. At the Queen's Hotel, Birmingham. At 7.30 p.m. Paper on "The Research Factor in Cable Making," by Capt. P. Dunsheath.

Junior Institution of Engineers.—Friday, January 8th. At 39, Victoria Street, S.W. Paper, "Notes on Salesmanship," by Mr. A. J. Simpson.

Institution of Electrical Engineers.—Monday, January 11th. At the Institution, Victoria Embankment, W.C. At 7 p.m. Informal meeting. Discussion on "The Electrical Installation in the Rockefeller Building, University College," to be opened by Mr. W. C. Clinton.

(North-Eastern Centre).—Monday, January 11th. At Armstrong College, Newcastle-on-Tyne. At 7 p.m. Ordinary meeting.

(North-Midland Centre).—Tuesday, January 12th. At the Hotel Metropole, King Street, Leeds. At 7 p.m. Ordinary meeting.

(Scottish Centre).—Tuesday, January 12th. At the North British Station Hotel, Edinburgh. At 7 p.m. Paper on "Electricity Supply Tariffs," by Mr. H. M. Sayers.

(South-Midland Centre).—Wednesday, January 13th. At the Grand Hotel, Birmingham. Annual dinner.

(Western Centre).—Monday, January 11th. At the Hotel Metropole, Swansea. Address by the president, Mr. R. A. Chattock, and annual dinner.

(Dundee Sub-Centre).—Thursday, January 14th. At University College, Dundee. At 7.30 p.m. Paper on "Atmospheric Electricity," by Mr. W. M. Mackay.

(Scottish Students' Section).—Friday, January 8th. At the Royal Technical College, Glasgow. At 7.30 p.m. Paper on "Earthing of Systems," by Mr. S. A. Knight.

(North-Western Centre, Students' Section).—Tuesday, January 12th. At the Milton Hall, Deansgate, Manchester. At 7.30 p.m. Paper on "Thermal Protective Devices," by Mr. E. C. Scott.

(South-Midland Students' Section).—Monday, January 11th. At the Temperance Hall, Temple Street, Birmingham. At 7 p.m. Exhibition of films.

Glasgow Corporation Electricity Department Engineering Society.—Monday, January 11th. At the Welfare Hall, St. Andrew's Cross Works. At 7.45 p.m. Paper on "Commutation," by Mr. P. Hunter.

Association of Mining Electrical Engineers (London Branch).—Tuesday, January 12th. At the Engineers' Club, Coventry Street. At 6.30 p.m. Paper on "Rescue Apparatus for Mines," including demonstration of certain apparatus, by Messrs. Siebe Gorman, Ltd.

(South Wales Branch).—Saturday, January 16th. At Cardiff. Annual dinner. Visit by the president, Mr. Theodore Stretton.

(Western District Sub-Branch).—Saturday, January 9th. At 62, Wind Street, Swansea. Paper on "Electrical Costing Applied to Collieries," by Mr. C. E. Yates.

Institution of Civil Engineers.—Wednesday, January 13th. At the Institution, Great George Street, S.W. At 6 p.m. Informal meeting. Discussion on "The Testing and Examination of Materials for Railway Construction," to be opened by Mr. F. J. Paice.

Institution of Engineers-in-Charge.—Wednesday, January 13th. At St. Bride Institute, Bride Lane, E.C. At 8 p.m. Paper on "Industrial Economics," by Mr. J. W. L. Rowe.

Institution of Engineering Inspection.—Friday, January 15th. At the Royal Society of Arts, John Street, Adelphi, W.C. At 7.30 p.m. Paper on "The Characteristics of Electric Lamps in Relation to their Testing," by Messrs. B. P. Dudding and G. T. Winch.

Institution of Mechanical Engineers.—Friday, January 15th. At the Institution, Storey's Gate, S.W. At 7 p.m. Discussion on "Novelties at the 1925 Engineering Exhibition."

Manchester Electro-Harmonic Society.—Friday, January 15th. At the Albion Hotel, Piccadilly, Manchester. Concert.

Electrical Development Association Conferences.—Friday, January 15th. At Caxton Hall, Westminster, S.W. Lecture on "Suggestion and Auto-Suggestion in Salesmanship," by Mr. Ll. B. Atkinson.

Electrical Trades Commercial Travellers' Association.—Friday, January 15th. At E.L.M.A. Lighting Bureau, 15, Savoy Street, W.C.2. At 7 p.m. Lecture, "Demonstration of Lighting," by Mr. W. E. Bush.

Notes.

The Batti-Wallahs' Society.—Sir Hugo Hirst, Bart., will address the Batti-Wallahs at their next luncheon, which is to be held at the Hotel Cecil on January 27th.

N.A.S.E. Economic Premiums.—The two cash prizes offered by Mr. F. Gill, M.Inst.C.E., M.I.E.E., president of the National Association of Supervising Electricians, for the two best papers dealing with economic questions (ELECTRICAL REVIEW, October 9th) have been awarded as follows:—Mr. C. W. Bullock, London, first prize £10, for a paper on "Industrial Relations" (between employer and employed); Mr. E. J. Davies, Nantyglo, Mon., second prize, £5, for a paper on "Economics in the Electrical Industry."

Boiler Explosion Report.—We have received a copy of the official report of the preliminary inquiry into an explosion which occurred in a water-tube boiler at the Lots Road power house, Chelsea, on September 19th last. The boiler was made by Messrs. Babcock & Wilcox. One of the cap-retaining clamps in a header at the front of the boiler was fractured and the cap forced off. The material at the fracture is said to have had an unsound appearance, and probably was in a fatigued state. The management is recommended to replace all the original or worn clamps by others of stronger form or section.

Fatalities.—It is reported that Horace Newcombe, a chauffeur, of West Bridgford, was killed recently by an electric shock. He was using a hand lamp while repairing a car, when the bulb broke and the current passed through his body. Artificial respiration was resorted to without success.

On January 1st, Alfred Gains, a porter, was cleaning a gutter upon the roof of a building at the Sutton (Southern Railway) station when he came into contact with a 6,000-V cable and was instantly killed. At an inquest held on January 5th, a verdict of "Accidentally electrocuted" was returned.

(*Continued on page 63.*)

The Comines Power Station.

A French Central Station using Pulverised Fuel.

By THEODORE RICH.

WHEN the war was over the bulk of the French people, both masters and men, recognised that the only method by which the ravages of war could be eliminated and the five years' loss of economic production could be made good was by enterprise and hard work. Although on the morrow of the Armistice the politicians of France dealt a blow at reconstruction by enacting an eight-hour law, yet apart from the return of the Briey iron ore district, the development of business in coal, iron and general industry has been in many ways remarkable.

In anticipation that the "searching the pockets" of the late enemy would be something more than the optimistic make-believe of professional politicians, very large sums of borrowed money were spent in the devastated areas, and the financial embarrassments of the present day are to a large extent due to the non-fulfilment of such pledges; all the same, the condition of the exchange is no criterion of the relative state of the national assets. A great deal of solid work has been done in the North-East, West, and South of France that will doubtless bear good fruit in the near future.

Power Requirements.

The district within, say, 15 miles of Lille, which includes Roubaix and Tourcoing, forms the Lancashire of France as far as textile industries are concerned; the atmosphere is somewhat similar, and British mill-wrights have left their stamp on the design of many works in the neighbourhood. Some of those who were in khaki in 1918 and saw the ruined buildings would be astonished at the way in which many things have been put right again, although mounds of brickwork covered with weeds, where houses used to be, can still be seen in the streets of many towns.

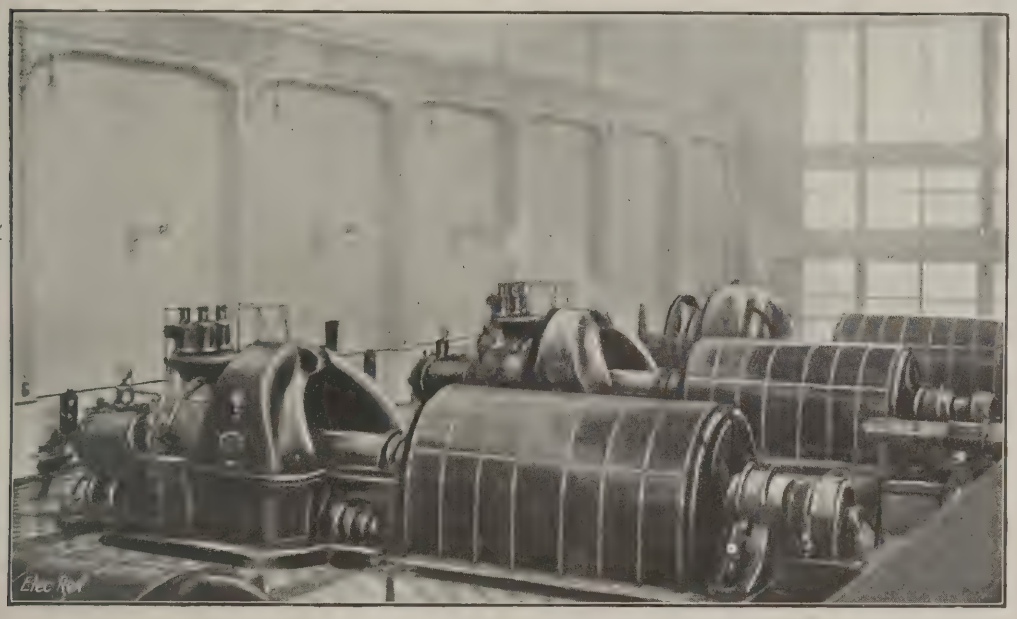

Fig. 1.—Interior of Turbine House, Comines Power Station.

Fig. 2.—Transporters and Coal Dump.

Fig. 3.—Front Elevation of Station.

Before the war a company, the Energie Electrique du Nord, supplied power, mainly in bulk, to various lighting, power, and tramway undertakings, and to some individual power consumers in a district stretching from the eastern and northern sides of Lille to the Belgian border behind Roubaix, and in some districts more to the west, from a power station of 40,000 kW at Wasquehal, near the centre of the district. This station is situated alongside a canal, and therefore the loss and inconvenience due to the use of cooling towers for the condensing water had to be contended with. In 1918 some of the plant was taken away by the Germans, and some of the remainder was wilfully damaged; it was, however, quickly put in order.

A New Power Station.

Not long after the Armistice it was decided to put down a high-power station to meet the increasing needs of the neighbourhood, and a convenient site at Comines was decided on because of its facilities for coal transport and for condensing water; it is situated about 10 miles from Lille and about the same distance from Roubaix, and within easy distance of Halluin on one side and Armentières on the other. The whole lay-out of the power station is based upon the use of generating sets of 25,000 kW, as being an all-round useful size of plant. The station is placed alongside a navigable river, the Lys, a tributary of the Scheldt, the river at that point forming the frontier with Belgium. Coal

is obtainable in the neighbourhood by rail or by barge, and also from Belgium or Germany, and from England *via* Calais, Dunkirk, or Antwerp if required. The basin of the river Lys, when added to that of its tributary the Deule, covers several hundred square miles, and the flow is assisted by the discharge from several descending canals, the water passing being at the minimum over 5 cubic metres per second. The site, which is practically level, lies about 1 metre above flood mark. The subsoil consists of clay running into brick earth; it is not suitable for taking heavy loads, and those parts of the station which carry great weights, for instance, the boiler houses and the turbine foundations, are supported on piles 7 to 8 metres long, many of these being made of armoured concrete.

The original lay-out of the station was planned to allow of extensions, especially with a view to the convenient location of condensing-water conduits. The turbine-house plan is perpendicular to the river, space being left so that when the power demands exceed the cooling capacity of the river flow, cooling towers can be put down between the turbine house and the pump house on the bank. There are two boiler houses; in the original installation there were ten boilers in one house, each with 1,000 square metres (10,760 sq. ft.) of heating surface, five boilers sufficing for each 25,000-kW turbine unit.

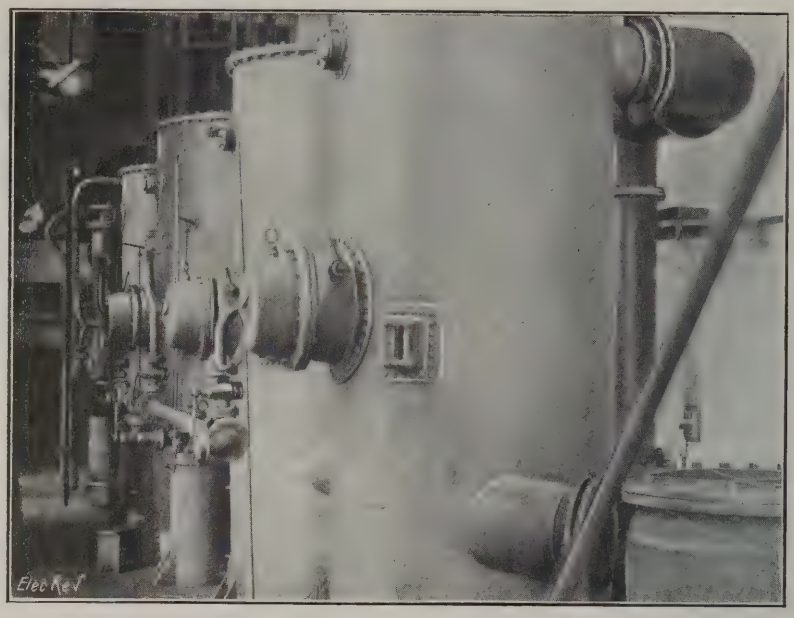

Fig. 6.—Kestner Evaporators.

In 1924 a new boiler house was built, in which two boilers have been installed up to date. The station supplies power by means of aerial lines along two main 45,000-volt trunk routes to two main disconnecting stations, one on the outskirts of Lille at La Madeleine and the other located between Roubaix and Tourcoing; in each case the final section, inside populated areas to the step-down sub-stations, consists of balanced single-core unarmoured cables. At the two main step-down stations the pressure is reduced to 10,500 volts; there are also some local aerial distributing lines at this pressure radiating from the Comines station. From the sub-stations 10,000-volt cables connect to the various bulk distributors and consumers, and connection is made to the original station at Wasquehal, so that the load can be sectionalised as desirable to suit the needs of the moment; in case of emergency such auxiliaries at Comines as are electrically driven could be supplied with current from this other station. Some details of the cable system will be given later.

Fig. 4.—Belt Conveyor in Roof between Economisers.

Fig. 7.—Pulverised Coal Feeders.

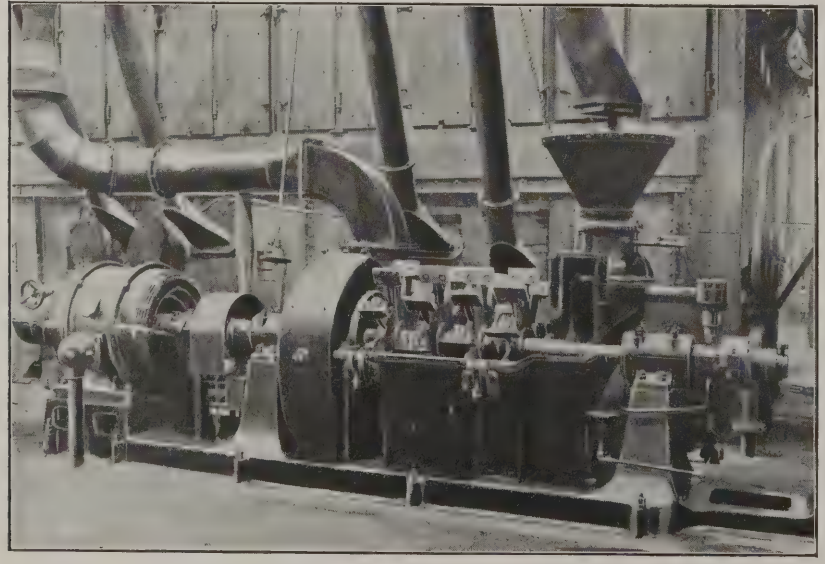

Fig. 5.—Pulveriser, Open.

The Buildings.

Armoured concrete has been used very largely in the construction of the buildings, and also for the coal bins over the boiler house. As is usual on the Continent, the buildings are roomy; there is ample space round the station, and further, owing to the facilities for the removal of ash, no space is necessary for ash dumping. The building for the transformers and switchgear takes up more floor space than the turbine house. The switchgear is of the conventional oil-tank type, the bus-

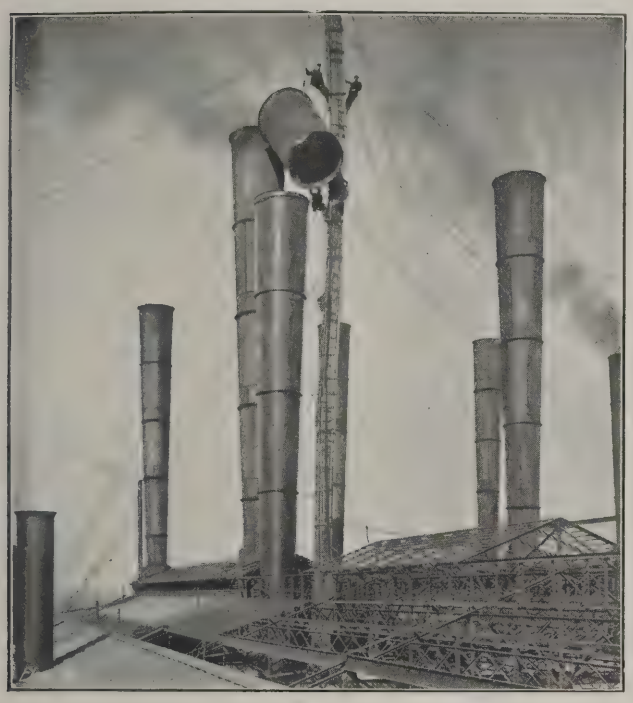

Fig. 8.—Erection of Prat Chimney in Progress.

bars and internal connections being largely of bare strip.

The station was at first equipped with three generating sets of 25,000 kW each, one of which was considered

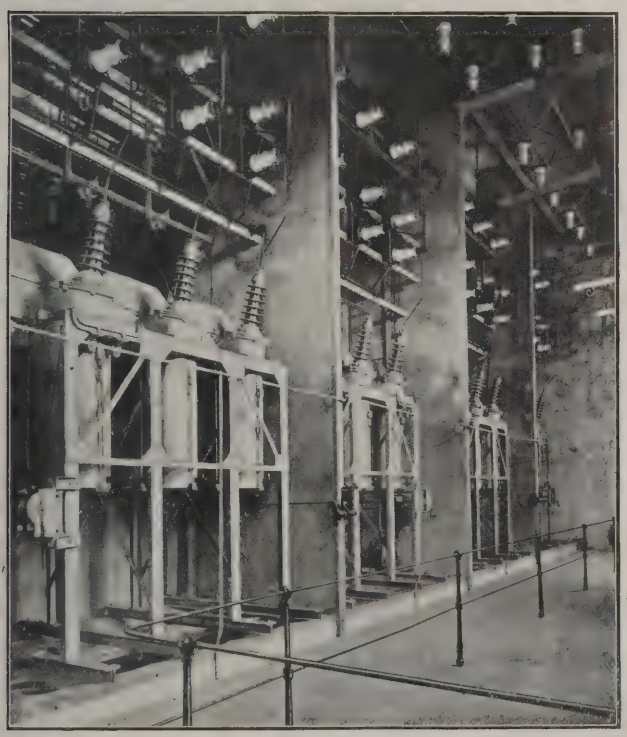

Fig. 9.—Main Oil Switches.

as reserve; the load, however, increased so rapidly that extensions were taken in hand in 1924, and a further set has been added in a lengthened turbine house, space being provided also for a fifth. At the time when the station was originally designed, some classes of electrical plant were difficult to obtain within the desired time for delivery, and this factor had some influence especially on the auxiliaries. Power stations as a rule are not beautiful, but the use of armoured concrete for the walls and the adoption of bold lines has in this case given the structure an appearance consistent with its object, namely, the supply of power; the buildings, as shown in fig. 3, despite the multiple chimneys, do not look so "tin-canny" as some other modern examples.

In order to deal more fully with certain features, the technical details will be given somewhat out of the usual sequence.

The 25,000-kW generating sets are arranged crossways in the turbine house at 13 metres (42 ft. 8 in.)

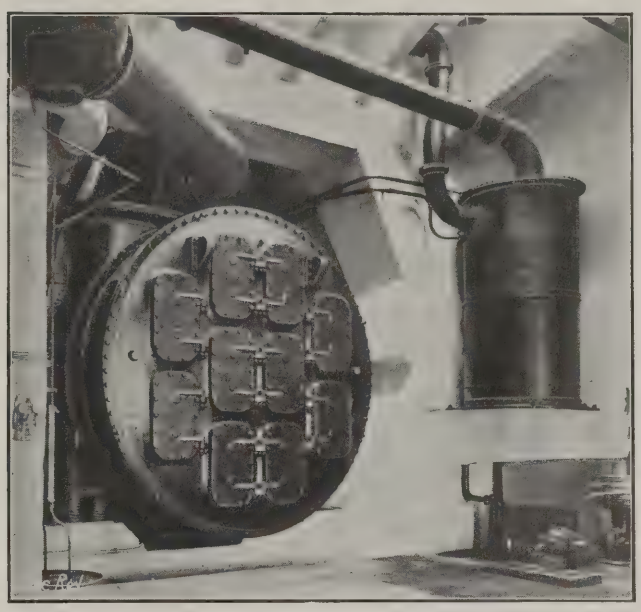

Fig. 10.—Condenser.

centres (fig. 1). They are of the Schneider-Zoelley type, running at 1,500 r.p.m. The steam end is arranged for

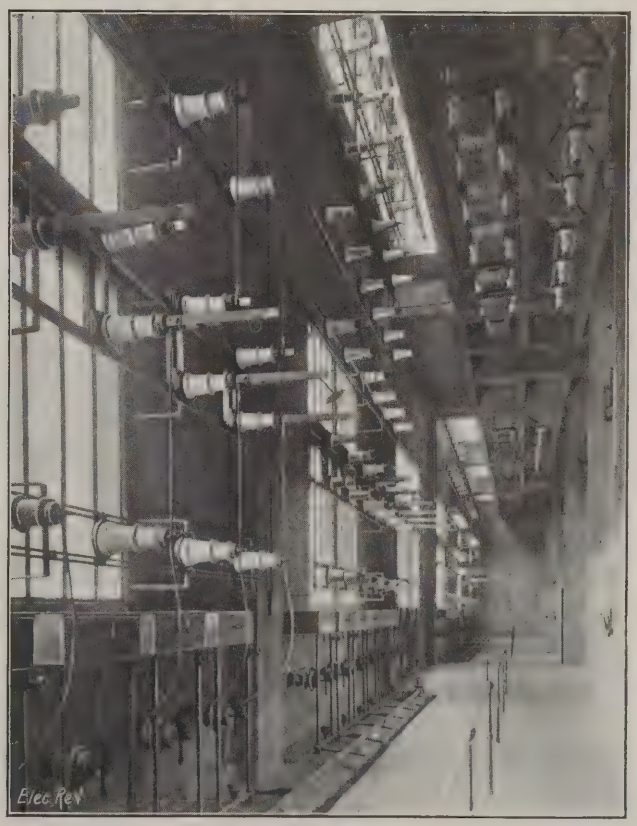

Fig. 11.—Section Links.

an effective pressure of 18 kg. per sq. cm. (about 260 lb. per sq. in.) at 350 deg. C. (660 F.) total temperature. The alternators are wound for 10,500 volts across phases; they are designed to give the normal output at a power factor of 0.8, with a rapidly falling characteristic so that they will stand a short circuit at full pres-

sure without injury. An exciter at 250 volts is coupled to each set. There is also a 160-kW asynchronous motor-generator set wound for 220 volts on the a.c. side, which acts as a reserve exciter for any of the generating sets. The cooling air for the alternators passes through water-jet filters, and is discharged under the boilers. The turbine house, which has a span of 24 metres (80 ft.), is served by an electrically-driven (220-volt d.c.) overhead traveller with a 60-ton main lift, and an auxiliary lift for dealing with weights up to 10 tons.

The condensers are of the Delas type, with their axes placed at right angles to the turbine shafts; the circulating water is delivered through sluice valves from two armoured concrete condensing pressure mains, one on each side, the discharge being into a rectangular conduit running lengthways beneath the turbine house under the axis of each condenser body. The reasons for this construction will be given later.

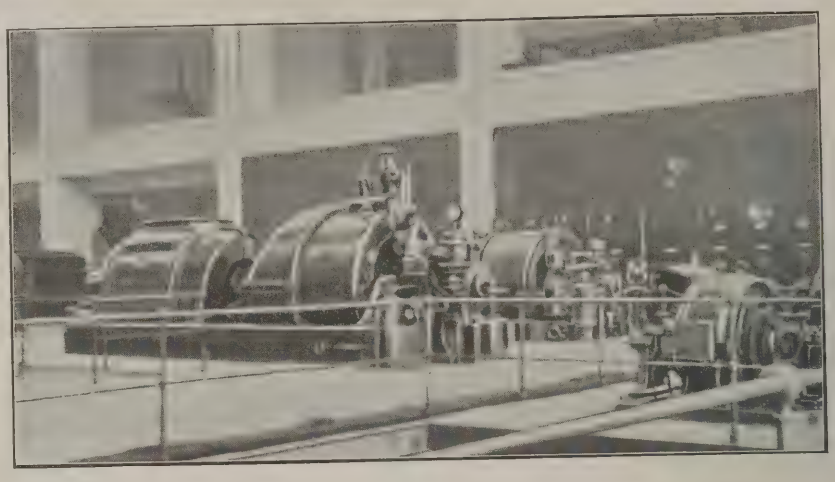

Fig. 14.—Auxiliary Turbo-Generators.

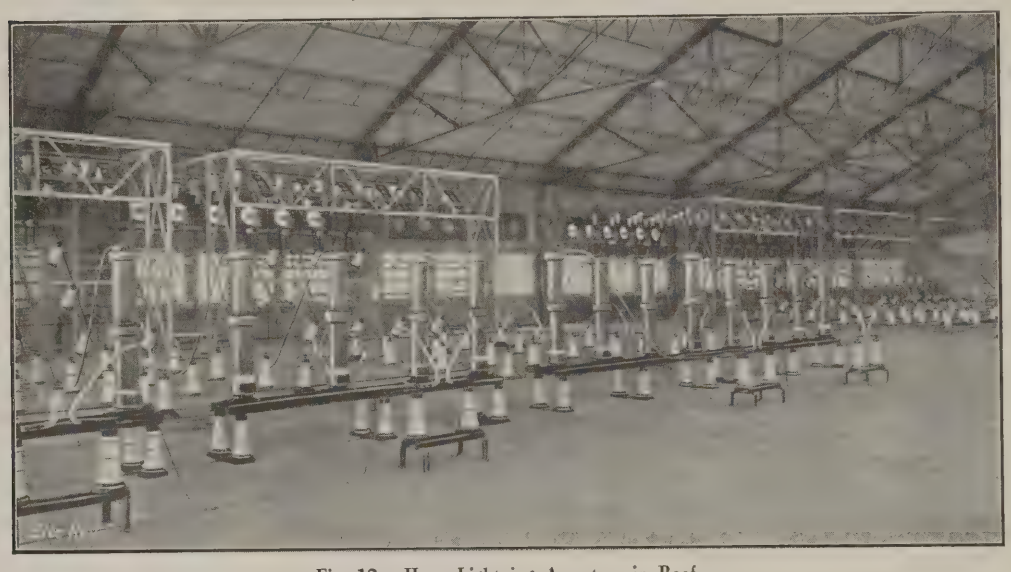

Fig. 12.—Horn Lightning Arresters in Roof.

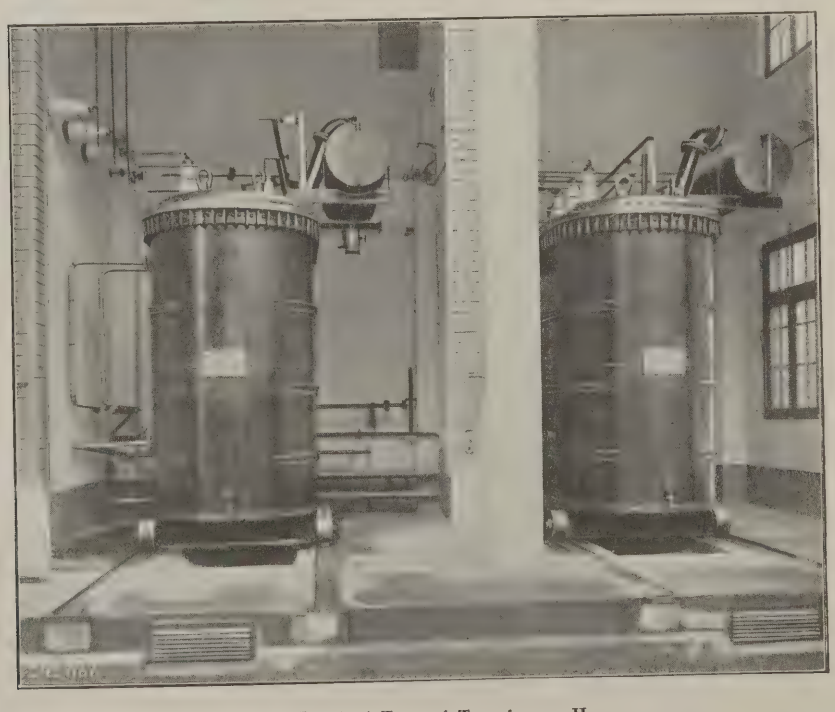

Fig. 13.—Standard Type of Transformer House.

Among the features of special interest at this station are the coal- and ash-handling arrangements, the use of powdered fuel on some of the boilers, the Kestner distillers, the circulating water system, and the arrangement of the switchgear.

The coal as a rule comes from a number of French collieries by rail or barge; each consignment is analysed, and after unloading is dumped in heaps according to analysis. It is about 15 to 16 per cent. volatile, and contains up to about 25 per cent. ash, being delivered unwashed; it has a heating value of 6,200 to 6,500 calories per kg. (ave. 11,500 B.th.u. per lb.). For the unloading, storage, and selection of the coal, three electrically-driven transformers are used with overhanging arms, 27.5 metres (90 ft.) total length, each fitted with a grab of 1.8 metres capacity (fig. 2). One of these is used for unloading barges and the other two for dealing with coal coming by rail. All three are used also for drawing coal from the dump. The transporter motors are d.c., 220 volts.

To deal with water-borne coal, a dock was constructed 85 metres long, 22 metres wide, and 3.25 metres deep; it is large enough to hold three 250-ton barges. The dock walls were made with ribbed armoured concrete slabs on the "Ravier" system, forming sheet piling, driven by means of a pile driver. The barges can be unloaded at the rate of 60 tons per hour.

The coal which comes by rail is delivered by the Nord Railway; the trucks are shunted, by means of a 120-h.p. 4-wheeled petrol-electric locomotive, into convenient positions alongside the coal dumps, three of which are arranged parallel to the dock. The coal is picked up out of the trucks by means of grabs, and any coal which remains in the corners of the trucks is shovelled or swept into pits, from which it is lifted later by the same grabs. In addition to the three transporters, there is a self-propelling electric jib crane running on railway tracks with

a radius of 8 metres (26 ft.), with a grab of 1 ton capacity, but which will lift 2½ tons as an ordinary crane when used without the grab.

Coal Mixing.

There are two types of stokers used—chain-grate and pulverisers; the different qualities of coal in stock are mixed in such proportions as experience shows to be most advantageous for each type of stoker. The coal required for consumption is lifted by the transporter grabs or by the crane grab and discharged into three self-propelled hoppers, which can be moved in a direction parallel with the coal dump sidings. Each hopper has a capacity of 40 tons, and its mouth is protected by steel grid bars placed 150 mm. (6 in.) apart to stop any large lumps; by means of a vibrating feeder, worked by a 15-h.p. enclosed motor, the discharge from each hopper can be regulated.

The hoppers discharge on to a belt conveyor 155 metres long, driven also by a 15-h.p. enclosed motor. By regulating the feed of the three hoppers on to the same belt, any desired mixture from any selected heaps can be obtained at will. The belt of the conveyor is 700 mm. wide (27½ in.), and its capacity is 80 tons per hour; on its way it passes over a Herrick integrating weighing machine. The coal, whether for the chain-grates or for the pulverisers, passes through a breaker driven by a 20-h.p. motor, which reduces it to pieces not larger than 30 mm. (1.2 in.) diameter; it is then delivered into the boot of one of two bucket elevators, which raises it to a level above the storage bins over the boiler house; one of these elevators is kept in reserve. The elevator works in a lattice-work tower (fig. 2), and delivers the coal on to a horizontal belt, with a capacity of 45 tons an hour; by means of a throw-off gear, which can be seen in fig. 4, the coal is delivered into any bin desired. The economisers can be seen to the right and left in the same illustration.

The transporters, the jib crane, and the crushers were supplied by the Société des Appareils de Levage, of Paris, and the belt conveyors, portable hoppers, and elevators by the Société des Transporteurs Mécaniques.

Ash Discharge.

The disposal of ash is a much more difficult matter than appears at first sight; ash is nasty stuff to deal with, it gets into bearings, when hot it tends to distort metal buckets or conveyor parts into all sorts of shapes, and at times it is corrosive. Under some conditions it is a great question how far elaborate ash-handling gear will pay for itself after allowing for maintenance.

At Comines, as at some other French power stations, the simplest appliances are used. The ashes from the chain-grate stokers fall into hoppers, and are emptied into small tip trucks on 60-cm. (2-ft.) gauge rails; the trucks are made up into trains and are hauled by an accumulator locomotive into a quenching shed, where water is turned on to jets on the top and sides of the trucks, actuated by an electrically-driven pump, and effectually cools the trucks and quenches the contents. The train is then hauled on to the wharf, where the ashes are tipped into barges; they are sold to builders and contractors for blockmaking, path-filling, &c., by the barge load at 3 fr. a ton, the cost of ash removal from boiler shoots to barges being about 50 centimes a ton. The ash dust which comes down from the pulveriser furnaces falls through a water-cooled outlet into a trough which is sluiced out from time to time. The amount of dust that comes down is compartively small, and the balance must of necessity go into the atmosphere in the form of very fine powder; as compared with sticky smoke, however, it is relatively unobjectionable.

(*To be concluded.*)

One-Man Car Report.—According to the *Electric Railway Journal* the report of the Railroad Commission on a one-man car accident on the lines of the Milwaukee Electric Railway and Light Co., showed that the number of accidents on one-man cars in Milwaukee was less than on two-man cars. The Commission found that the injuries sustained by the passenger in the case in question were due largely to a panic among the passengers.

Notes.

(*Continued from page 58*).

Appointments Vacant.—Linesman (77s. 5d.), for the Wolverhampton Corporation electricity department. Temporary overhead line assistant for the Worcester City Electricity Works. Meter reader and fixer for the Borough of Hornsey Electricity Department. Assistant clerk (£149) for the Beckenham U.D.C. Electricity Department. (See our advertisement pages to-day.)

The Engineer and Civilisation.—In his presidential address to the American Society of Mechanical Engineers, last month, Prof. W. F. Durand, of Stanford University, traced the history of the engineer from the skilled arrow-head maker of the stone age up to his successor of to-day, and discussed the place of the engineer and of engineering societies in the fabric of civilisation. He concluded:—

To sum up the whole matter, the engineer, either as an individual or as a collective type, is simply a link in the chain of human progress—a chain the links of which, in one form or another, run back into a past removed from our own time by tens of thousands of years, to go to no higher figures. With the trend of human progress as it now is, he seems, moreover, to be a very necessary link. He has taken upon himself the peculiar function of developing and translating into use for the needs of civilisation the constructive materials of the earth and the inorganic energies of nature, and in connection with the exercise of such function he has acquired peculiar and weighty duties and responsibilities.

There are naturally the duties of self-development and improvement, both individually and collectively, as organisations such as our own. This is the duty so well inculcated by the scriptural parable of the talents. Likewise there are the duties of friendship and of co-operation for the realisation of larger ends, and, again, both individually and collectively, as organisations.

And then it is peculiarly the duty of the engineer to see that, so far as in him may lie, these stores of nature, of which he is the custodian, are used frugally, with due regard to their limited supply, and having in mind the needs of future generations. Again, it is his duty to leave behind him some definite increment to that great store of knowledge through which we are able to enter into partnership with nature, and only by means of which we may hope more effectively to align ourselves with her laws and thus maintain an ever-ascending gradient of human progress.

Again we must, individually as we may, and collectively with definite purpose, endeavour to co-operate helpfully with agencies charged with the training of recruits for our ranks, to the end that there may be a continued and adequate supply to the younger strata in our guild, whence we may hopefully look for leadership and guidance in the future.

And, finally, since in the exercise of his functions as an engineer he must of necessity develop and employ habits of mind and methods of study which may be usefully employed in dealing with problems as they arise in all activities in life, therefore should the engineer stand ready to serve, not only in his chosen sphere, but wherever and whenever his habit of mind, his training and his experience may enable him to contribute a helpful element in this great co-operative enterprise which we call civilisation.

An All-Electric Experiment.—Subsequent to the publication of the article under the above heading in our issue of last week, we have been informed that the Woodlands Housing Society, Ltd., is a public utility society registered under the Industrial and Provident Societies Act, and is at the same time a subsidiary undertaking of the Bournville Village Trust for the development of a portion of the Bournville Estate. The estimate which appeared in the Electrical Review of July 24th last, to the effect that by putting in only one ordinary fire grate a saving of twenty pounds would be made, has proved a very close one, and is confirmed by final costs. In the case of the "all-electric" house the saving is said to be approximately sixty pounds. It is estimated that in the case of the one-coal-fire house the weekly consumption for lighting, for a family of 5-6 persons, will be 3 kWh, for irons, &c., 3 kWh, and for cooking all food, 35.5 kWh. It is interesting to learn that from actual tests taken in all parts of the country the following figures of total consumption per annum have been estimated:—In the case of the all-electric house, 5,350 kWh, and in that of the one-coal-fire house, 4,166 kWh. Over nine hundred people visited the house during the demonstration week.

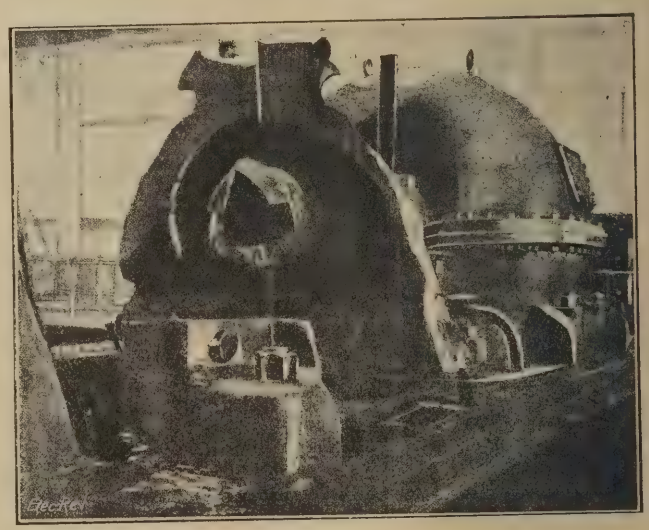
Legal.—Llandudno Council *v.* Llandudno and Colwyn-Bay Electric Railway, Ltd.—The Council recently instituted proceedings against the company for its alleged failure to keep its permanent way in a proper state of repair. The case was due to come before the Llandudno Petty Sessions on December 21st, but upon that date counsel for both parties announced that they had come to an agreement and the summons was therefore adjourned *sine die*.

Fire Offices and the I.E.E. Wiring Rules.—The secretary of the Fire Offices' Committee, London, informs us that the Offices associatoed with the Committee, numbering over 90, have given their formal approval to the 1924 Edition of the Regulations of the Institution of Electrical Engineers for the

Electrical Equipment of Buildings, and adopted the Regulations as standard practice. A letter to this effect has been circulated amongst electricity supply undertakers, consulting and installing engineers and contractors, and architects, together with a list of the companies concerned.

Ancient and Modern Methods.—The accompanying picture, received from a correspondent, illustrates an interesting juxtaposition of the old and the new which has recently been brought about in British Cochin by the installation of a town lighting and power scheme. Technically, the scheme calls for no comment, and a very brief description of the equipment will suffice. The engines are Vickers-Petter verticals driving by ropes Crompton alternators—3-phase, 2,200 volts, 50 cycles. The high-pressure transmission is by overhead mains to pole-type transformers, from which distribution is effected on the 4-wire system, high-pressure and low-pressure mains being carried on the same poles wherever possible. The illustration shows, side by side, working products of the twentieth century B.C. and the twentieth century A.D. The peculiar type of

A Contrast Between Old and New Industries.



fishing-gear is essentially Chinese, and in India is found only on the Malabar Coast. Our correspondent has no information regarding the time or manner of its introduction into India. The electrification scheme has been carried out by the Crompton Engineering Company (Madras), Limited, which is also the licensee.

Radio Uses of Piezo-Electric Crystals.—Piezo-electricity is having some remarkable new applications. Certain crystals undergo a slight expansion or contraction when an electrical pressure is applied to them and, *vice versa*, produce a slight voltage when compressed or pulled. A piece of quartz crystal 1 or 2 in. long has a high natural frequency of the same order as the frequencies of currents used in radio communication; the frequency of vibration of the piece of quartz is extraordinarily constant and is very useful as a radio standard. In association with a small electron tube it acts as an oscillator or a generator of current, the frequency of which is that of the mechanical vibration of the piece of crystal. As the frequency thus produced is accompanied by numerous harmonics, the crystal is a standard giving several radio-frequencies; it is thus a remarkable supplement to the wave meters which have hitherto been used as standards of radio-frequency.

A study just completed by the American Bureau of Standards indicates that such a quartz oscillator has many valuable applications in radio work. Means of producing audio- as well as radio-frequencies were worked out. The crystals can be used to control or determine the frequency of a transmitting station and to hold it strictly constant, which will mean a great advance in radio-transmission technique. The crystals are also useful in accurate setting of receiving apparatus and for controlling the frequency of radio-frequency generators used in laboratory measurement work. The value of these various applications is particularly great at the frequencies above 2,000 kilocycles which are now rapidly coming into use. A preliminary paper on this work has been prepared and will appear in the *Proceedings* of the Institute of Radio Engineers. Part of the work resulted in the design of an outfit for use by the U.S. Department of Commerce radio inspectors and adapted to the rapid and accurate standardisation of frequency meters. It consists of two simple instruments, both being operated by dry batteries. Copies of specifications for "Portable Piezo Oscillator, Type N," and for "Portable Auxiliary Generator, Type O," together with directions for the use of the two instruments (letter circular 183), may be obtained upon application to the Bureau of Standards, Washington, D.C., by persons having actual use for them.

The Effect of Altitude on Electrical Installations.—In a recent issue of *Elektrotechnik und Maschinenbau*, Herr A. Lubowsky, of the Allgemeine Elektricitats Gesellschaft, Berlin, deals with the effect of altitude on electrical installations. Standard electrical engineering practice which is based on the conditions obtaining at average altitudes, may fail to give good results in very hilly countries owing to the reduction in the density of the air, its heat conductivity, the proportion of oxygen, &c. In the case of electrical machinery, as a result of the reduced air density, the efficiency of cooling diminishes. M. Lubowsky points out that, whereas German standard practice may be adopted for altitudes up to 3,280 ft., American and British regulations provide for a reduction in the nominal efficiency of a machine used at high altitudes, which for heavily-loaded machines is reckoned at 1 per cent. for each 328 ft. above 3,280 ft. The same rule applies to transformers, but in this case the normal output may be maintained by increasing the size of the oil receptacle. M. Lubowsky states that altitude has a negligible effect on the dielectric strength of materials utilised in high-pressure apparatus. This does not, however, apply to discharge pressures in the air which are reduced in proportion to the decrease in air density. It is agreed, however, that the normal strength of high-pressure apparatus decreases with an increase in altitude in the same proportion as the nominal power of a machine. In high-pressure transmission lines the section of the conductors should be such that no corona effect is produced. The working pressure should be reduced 1 per cent. for each 328 ft. increase in altitude, and thus a 100,000-V line transmitting at sea level would be only suitable for 50,000 volts at an altitude of 16,400 ft. At such an altitude the section of the conductors to transmit at 100,000 volts would require to be that of a 200,000-volt line at sea level. As regards cables, the effect of altitude is considered to be negligible. For starting gear and regulating devices other considerations than altitude have to be taken into consideration. The effective head of hydraulic turbines decreases as the altitude becomes higher; for a barometric pressure of 760 mm. the practical suction head is 6 metres, and for a pressure of 520 mm. (which corresponds to an altitude of 16,400 ft.), the available head is only 2.8 metres. With internal-combustion engines any diminution in air density owing to altitude results in less oxygen being drawn into the engine, resulting in a reduction of the power development of about 1 per cent. for each 328 ft. of altitude; at the same time fuel consumption shows an increase of from 0.5 to 1.2 per cent.

The Rand Turbine Failure.—The accompanying illustration shows the wrecked alternator after the breakdown at the Vereeniging power station of the Victoria Falls and Transvaal Power Co. on December 8th last (ELECTRICAL REVIEW, December 11th and 18th). The shaft at the point of fracture is about a foot thick. In an official statement by Mr. Bernard Price, chief engineer to the company, he said that the machine

The Wreck of a 10,000-kW Alternator.

broke its shaft, which allowed the rotating part to foul the fixed portion; this immediately burst the frame of the machine. A very rough estimate of the total cost of the damage to the machines, buildings, &c., was put at £50,000. The illustration is reproduced from the *Rand Daily Mail*.

Radio Direction-finding Aircraft.—The aeroplane flying on the experimental night service which Imperial Airways will inaugurate on January 15th will be fitted with a form of wireless compass which will direct the pilot towards his destination. According to the *Morning Post* the pilot will listen for signals in his head telephones which will vary in strength according to how much the machine departs from its true course. In order to use this particular method of direction finding, the aeroplane is being fitted with coils placed between the fabric of the wings. While the machine is on its way from Paris to Croydon receiving apparatus working in conjunction with the wing coils will pick up a reiterated signal from the Croydon wireless station. It is claimed that this will be the first time that this method of direction finding has been employed on a regular air service. Besides the wireless compass, pilots flying machines on the night service will be aided by ten illuminated points on the route.

Mysterious Noise at a Power Station.—A noise, described as resembling a "gentle fog-horn," has annoyed the residents in the vicinity of the new power station of the Hastings Corporation for some time, and has defied identification. Prof. A. M. Low has photographed the sound-waves with a Low-Hilger audiometer, and finds that the main audio-frequency wave is acting as a carrier for other waves, indicating that

there are several different sources of vibration at work. The noise appears to emanate from the boilers, but is also ascribed to vibrating machinery; whilst it can be heard two miles away, it is inaudible at places within half a mile of the power station.

Swedish Water-Power Development.—In the course of an article upon this subject in the December *Swedish Export* (the organ of the General Export Association of Sweden) it is stated that Sweden's potential water resources are about 8.8 million h.p. The Swedish waterfalls have been utilised to the extent of 1.4 million h.p. for industrial production on a large scale in districts where other natural resources are available. About three-quarters of the water power is situated in Norrland; this is undoubtedly a drawback in view of the sparseness of the population and the comparatively severe climate of that region. The annual production of hydro-electric energy in Sweden is estimated at 3,200 million kWh, or 500 kWh per head of the population.

Quick Repair Work.—A large rotor, weighing 30 tons, of a turbo-generator belonging to the London Electric Supply Corporation, Ltd., was shipped on November 12th by river and thence by rail to the Preston works of the English Electric Co. for repair. The rotor was completely dismantled, the copper re-annealed and the rotor re-wound, tested, and returned to the generating station in London in less than five weeks from the day it was dispatched. The English Electric Co. is to be congratulated on carrying out this difficult repair on a rotor which was not of its make, the actual time taken at the works being 22 days. When one considers the size of this piece of plant and the extreme difficulty of taking it apart, re-annealing the copper, and carrying out the necessary repairs, the company's feat may be counted a wonderful performance, and it shows what can be done in this country in spite of what one hears to the contrary. The railway companies also distinguished themselves in dealing with the transport of the plant so promptly, especially in view of the difficulty of procuring special trucks large enough for such a rotor, at a time when the railways were engaged in coping with their extra holiday traffic, to say nothing of the loading and unloading and barging of such a heavy piece of machinery on the River Thames.

Institution Notes.

Institution of Electrical Engineers.—EXTENSION OF ACTIVITIES OF THE WIRELESS SECTION.—The Committee of the Wireless Section of the Institution has further considered the proposal to form a new Institute of Wireless Engineers, and is definitely of the opinion that the interests of qualified professional wireless engineers are best served by the Institution of Electrical Engineers. The formation of a new Institute, it feels confident, is unnecessary, and will not be supported by representative and qualified professional wireless engineers. Engineers with adequate wireless qualifications can become Corporate Members, and other wireless engineers not reaching that standard are eligible as graduates and, as such, can attend all meetings of the Wireless Section as well as those of the Institution. With a view to improving and extending the activities of the Wireless Section, the following recommendations have been approved by the Council:—

While it is essential that the standard of qualifications for membership of the Institution should be maintained, more opportunity is to be afforded to the physicist engaged in wireless work to become a member of the Institution. Applications for membership of the Institution based upon the usual general scientific training and wireless professional qualifications are to be referred to a Wireless Section Membership Sub-Committee, which will guide the Membership Committee of the Council. The qualifications for membership of the Wireless Section are to remain as at present. The Wireless Section Committee is to get into direct touch with the Local Centre Committees and ascertain the possibility of:—(*a*) Starting local wireless sections; (*b*) stimulating efforts to produce local wireless papers and lectures at local centres. Each local Wireless Section, when properly constituted, is to be entitled to nominate one member to the Wireless Section Committee. A local Wireless Section is to consist of at least 15 members, who must already be members of the main Wireless Section. Wireless papers and discussions, in addition to appearing in the *Journal* of the Institution, are to be issued separately in the form of "Proceedings of the Wireless Section." The chairman of the Wireless Committee is to be an ex-officio member of Council, in the same way as are the chairmen of Local Centres, as soon as the necessary alterations to the by-laws can be made; in the meantime he will be invited to attend all meetings of the Council.

A.M.I.E.E. EXAMINATION.—The next examination will be held on April 15th, 16th, and 17th, 1926. Candidates must be either Students or Graduates of the Institution, or have lodged with the Secretary a duly completed form "E" for election as Associate Member. Entry forms for the examination, which must be completed and returned by February 1st, and particulars regarding election to membership of the Institution may be had on application to the Secretary, the Institution of Electrical Engineers, Savoy Place, Victoria Embankment, London, W.C.2.

MERSEY AND NORTH WALES (LIVERPOOL) CENTRE.—On Monday, January 18th, there will be an open meeting at the University of Liverpool, at 7.30 p.m., when the Faraday Lecture on "Illumination and Light" will be delivered by Mr. A. P. Trotter, M.I.E.E., with lantern slides and experiments. The public will be admitted, tickets being obtainable from the hon. secretary. Members of the Institution should apply for tickets, as admission will be by ticket only.

SOUTH MIDLAND CENTRE.—The annual dinner, postponed from November 27th, will be held on Wednesday next, at the Grand Hotel, Birmingham. There is a long list of speakers, and during the evening a special presentation to the president of the Institution, Mr. R. A. Chattock, will be made by the chairman, Mr. F. J. Moffett.

The programme for the second half of the session includes the following meetings and papers:—

January 27th.—"The Power Losses in Magnetic Sheet Material at High Flux Densities," by Mr. C. E. Webb.

February 12th.—Joint Meeting. Discussion on "Road Transport and its possible Developments." Speaker for "Electricals": Mr. C. O. Silvers.

February 17th.—"The Electrification of the Paris-Orleans Railway," by M. Parodi, Chief Electrical Engineer.

March 10th.—"Electro-Farming, or The Applications of Electricity to Agriculture." Kinematograph by Mr. R. Borlase Matthews.

March 31st.—"Power Factor and Tariff," by Mr. E. V. Clark. "Power Factor Improvement," by Mr. E. W. Dorey.

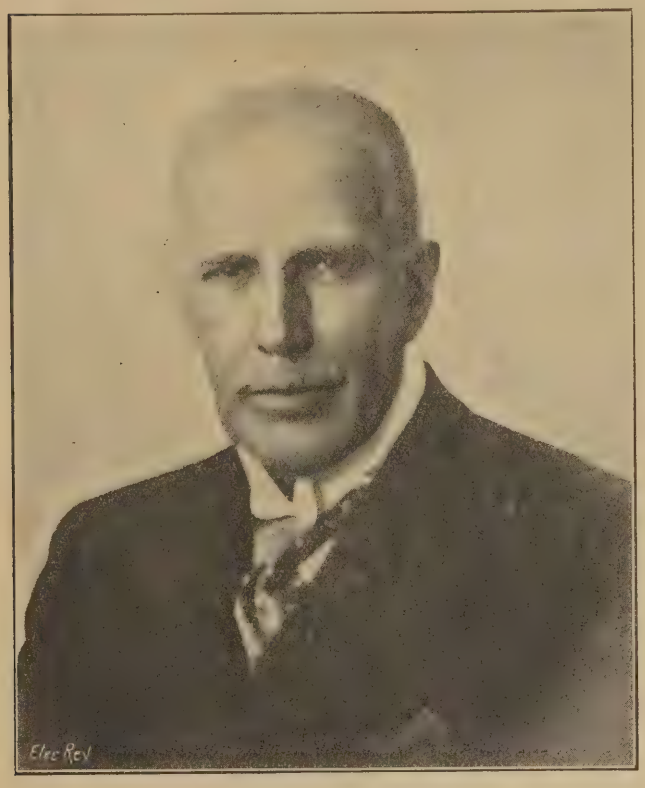
Radio Society of Great Britain.—OFFICERS.—The 12th annual general meeting of the Society was held on December 16th and the following office holders were elected for 1926:—*President*: Sir Oliver Lodge. *Acting Vice-President*: Brig.-Gen. Sir H. C. L. Holden. *Hon. Treasurer*: Prof. Ernest Wilson. *Hon. Secretary*: Maurice Child. *Members of Council*: O. F. Brown, Capt. Ian Fraser, O. W. Nicholson, J. H. Reeves, Earl Russell, Major T. Vincent-Smith, Dr. R. L. Smith Rose, and H. Bevan Swift.

A Wireless Institution in Ireland.—It is proposed to form, at an early date, an Irish Centre of the Institute of Wireless Technology, with the objects of promoting the general advancement of radio technology, and procuring the recognition of the status of the Institute by the Government, by public and local authorities, and other bodies in the country.

Junior Institution of Engineers.—At a meeting held on January 1st, six films were shown illustrating some of the work carried out at the River Don Works, Sheffield, of Messrs. Vickers, Ltd. The information imparted by these films as to the methods of production in a big steelworks proved of great interest to a large audience.

Diesel Engine Users' Association.—ELECTION OF OFFICERS.—Mr. E. W. Johnston (King's College Hospital) has been elected president of the Association for the year commencing January 1st, 1926. Messrs. F. A. Greene, M.I.E.E., and C. F. Mounsdon, A.M.I.E.E., have been elected to fill the vacancies on the General Committee, and Messrs. Percy Still, M.I.E.E., and Geoffrey Porter have been re-elected joint honorary secretaries.

At the December meeting the secretaries' annual statement was presented, concerning the progress made in the work of the Association, the increased interest in which was evidenced by the large number of publications which were sold to non-members during the year, this item amounting to £160. Towards the end of the year the final specifications for heavy-oil engines for electrical purposes were issued by the British Engineering Standards Association, on a committee of which the Diesel Engine Users' Association was represented, as well as the Incorporated Municipal Electrical Association.



Our Personal Column.

(Electrical men are invited to enable us to keep readers of the "Electrical Review" posted concerning their movements).

New Year Honours. — In the New Year Honours List there is less than there has been for a long while to interest the electrical profession and industry. Baron D'Abernon, H.M. Ambassador in Berlin since 1920, who becomes a viscount, is chairman of the Contraflo Engineering Co., Ltd., and a director of Parsons' Foreign Patents Co., Ltd. We congratulate Prof. T. Hudson Beare, F.R.S.E., M.Inst.C.E., M.I.M.E., &c., Professor of Engineering and Dean of the Faculty of Science at Edinburgh University, upon receiving the well-merited honour of knighthood.

As we reported some time ago, the successor to the late Sir Adam Beck in the post of chairman of the Hydro-Electric Power Commission of Ontario is Mr. C. A. MAGRATH, whose portrait accompanies this note. Mr. Magrath was born in Ontario in 1860. He adopted the profession of surveyor, and in this capacity was engaged in surveying land in the North-West. He attained the standing of Dominion Topographical Surveyor—the highest rank which can be reached by Dominion surveyors. For a number of years he was associated with Sir Alexander T. Galt and his son, who carried out a considerable amount of development work in Alberta, constructing railways, mining coal, and executing irrigation schemes. In all these enterprises Mr. Magrath played an important part, and in 1891, upon the incorporation of Lethbridge, he was unanimously acclaimed the first mayor. For several years he was a member of the Territorial Assembly of the North-West Territories, and in 1908 he became a member of the Dominion

House of Commons. He represented that body at the Coronation of the present King. Upon the conclusion of the Boundary Waters Treaty between Great Britain and the United States in 1911, Mr. Magrath was appointed a member of the International Joint Commission, and in 1914 he was appointed Canadian chairman of the Commission, a post which he held up to the time of his appointment as chairman of the Hydro-

Mr. Charles A. Magrath,
Chairman of the Hydro-Electric Power Commission of Ontario.

Electric Power Commission of Ontario. During the war he acted as Dominion Fuel Controller with great success, and he has been and still is active in a number of other departments of public life.

The permanent staff and employés at the Bangor City Electricity works recently presented Mr. Price F. White with an oak bureau to celebrate the twenty-fifth anniversary of his appointment as manager of the works. Mr. Goodwin, the assistant manager, presided, and the presentation was made by Mr. John Jones, the oldest member of the staff, who is 76 years of age.

Stirling Town Council has appointed Mr. Alex. Brewster as electrician for the ensuing year.

Mr. R. J. Millard has left the Electrical Apparatus Co., Ltd., and has joined the staff of Brookhirst Switchgear, Ltd.

Mr. E. H. Parsons, A.M.I.Mech.E., A.M.I.E.E. ("The Buffs," Reserve of Officers), late chief electrical and mechanical engineer to the British Empire Exhibition, has been appointed electrical and mechanical engineer adviser to the Chief Engineer of the British Forces in Iraq.

Mr. R. P. Sloan, the chairman and managing director of the Newcastle-upon-Tyne Electric Supply Co., Ltd., informs us that Mr. H. A. Couves, M.I.E.E., has been appointed general manager of that company and the following of its associated companies:—Cleveland and Durham County Electric Power Co.; Cleveland and Durham Electric Power, Ltd.; County of Durham Electric Power Supply Co.; County of Durham Electrical Power Distribution Co., Ltd.; Houghton-le-Spring and District Electric Lighting Co., Ltd.; and the Northern Counties Electricity Supply Co., Ltd. Mr. Couves, who joined the Newcastle company some 20 years ago, has occupied the position of chief of the Power and Construction Departments during the greater portion of that period.

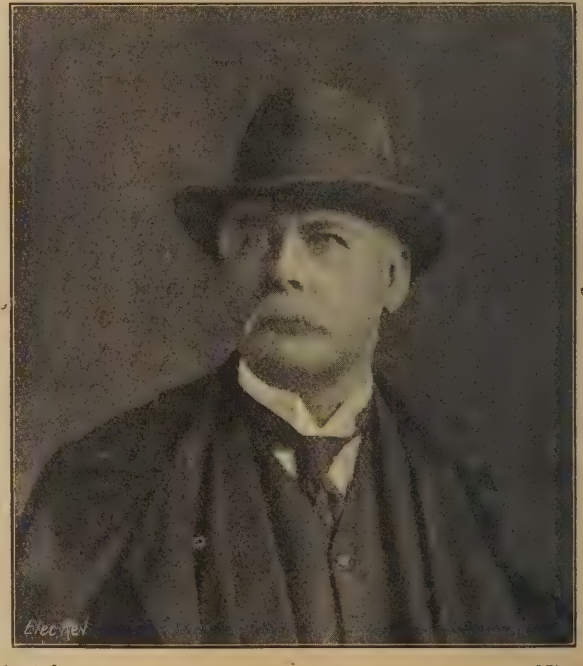
Capt. A. D. Gange, of Messrs. Siemens Bros. & Co.'s cable ship *Faraday*, has recently retired from that position after 22 years in the company's service, 17 of them as captain. Capt. Gange is a lieut.-commander (ret.) of the Royal Naval Reserve, He is succeeded by Capt. Allan.

On the occasion of his leaving the employ of Stalybridge Hyde, Mossley, and Dukinfield Tramways and Electricity Board to take up a position with the Yorkshire Electric Power Co., Mr. James Halkett was presented with a slide rule and fountain pen by the chief engineer and members of the staff.

Mr. E. R. Peacock has resigned from the position of president of the Barcelona Traction, Light and Power Co., Ltd. He retains his seat on the board, and will continue to act as chairman of the Bondholders' Committee. Mr. H. Malcolm Hubbard, vice-president, has been appointed chairman of the company, and Mr. F. Fraser Lawton, general manager of the subsidiaries in Spain, has been appointed president, and will continue to manage the Spanish subsidiaries.

Mr. Justus Eck has retired from the position of director of the Photector Co., Ltd.

Mr. V. Delebecque has joined Messrs. "Manda" Motors, Ltd., London, as general manager.



We regret to learn that, owing to serious illness, Mr. A. P. Lundberg (who, by the way, is now in his 95th year) was unable to be present at what was an interesting domestic function in connection with his firm—A. P. Lundberg & Sons, of Liverpool Road, N. Bonuses have been offered to the employés for many years past for good time-keeping, and an average of about 20 per cent. of the workers usually qualify for the honour. This Christmas an exceptional opportunity arose in the celebration of a 21 years' "No time lost" record, and as an appreciation of such a feat Mr. Ernest G. Burrell was presented by the firm with an inscribed gold watch. Mr. G. C. Lundberg, M.I.E.E., made the presentation on his father's behalf.

Mr. J. W. Sutton has retired from the position of manager of Messrs. George Kent, Ltd., after 60 years' service.

It is stated that Senatore Marconi will be one of the first members of the new Italian Academy of "Immortals."

On leaving the works of the British Insulated Cables, Ltd., Helsby, to take up another appointment, Mr. J. P. Higham, a member of the technical staff, was presented with a leather suit case by Mr. T. G. Briant, on behalf of the staff.

Obituary.—Mr. J. M. M. Munro.—We regret to learn that Mr. John M. M. Munro, F.R.S.E., M.I.E.E., died at the residence of his son, Mr. Donald Smeaton Munro, Edinburgh, on December 30th after a short illness. Mr. Munro was born in 1853 and became interested in telegraphy at an early age. Shortly after the invention of the telephone he commenced the manufacture of telephone instruments, and, we are informed, erected in 1877 the first complete practical overhead telephone line in Glasgow. In 1878 he invented and put on the market an incandescent electric lamp with a metallic filament; this received favourable attention in France and other countries. In 1880 his firm (Anderson & Munro) installed arc lamps at the offices of the *Glasgow Herald*, and in the following year it assisted Sir Joseph Swan to display his lamps to Sir William Thomson (Lord Kelvin) and others, later arranging a public exhibition of arc and glow-lamp lighting. Before the close of that year (1881) installations were being carried out at Selkirk, Hawick, and Renfrewshire with wiring systems devised by Mr. Munro. Other pioneer work done by the firm was the lighting of a steamer and the partial lighting of collieries. A great many country house lighting sets were installed, many driven by water power and running to this day.

Lafayette] [*Glasgow.*

The Late Mr. J. M. M. Munro, F.R.S.E., M.I.E.E.

Mr. Munro was a prolific inventor, among the patents standing to his credit being those for a quick-break lever switch, a zig-zag armature winding, a gravity-balance volt and ampère-meter, an integrating wattmeter, concentric wiring, perforated interchangeable wall sockets and lampholders, and a public fire-alarm system. As a consulting engineer he carried out many important works in the Glasgow district, and in 1892 he was called to Norway to advise on large hydro-electric schemes for the lighting of Christiania and elsewhere; in this connection his plans were approved by the late Lord Kelvin. Since 1910 he had acted solely as a consultant among his later jobs being the change-over to bulk supply of the Bo'ness Town Council and the extensions at Cambuslang of the Lanark County Council. During the war Mr. Munro was attached to the Royal Flying Corps, when he had charge

of the construction and testing of seaplanes. Mr. Munro was one of the founders of the Scottish Section of the I.E.E., and was an associate member of the Institution of Civil Engineers. The funeral took place on December 31st in the Dean Cemetery, Edinburgh.

DR. GEORG KLINGENBERG.—By the death of Dr. Georg Klingenberg on December 7th, in Berlin, to which we briefly referred last week, electrical engineering in Germany has lost one of its leading agnts and one whose name will long be remembered in connection with electricity supply operations.

The Late Dr. Georg Klingenberg.

Born in Hamburg in 1870, Dr. Klingenberg was educated at Osnabruck and Charlottenburg; at the latter place he became assistant to Prof. Slaby, a position which he held for some years. Although he devoted much attention to the theoretical side of electricity and engineering, as quite a young man he showed a strong desire to engage on the practical side of electricity supply development, and struck out into what at that time were entirely new directions. Thus in 1894 a central electric station in which superheated steam was utilised was built to his designs at Brettstedt, while in 1895 he prepared plans for a station at Marne, which was notable as being the first on the three-wire 2 x 220-V system, this being followed by increasingly large installations at Stettin, Charlottenburg, Halle, and Potsdam. Further evidence of his active brain came in 1896 when he made a notable contribution to the subject of the influence of high voltages on economical electricity transmission, and it was not long ere Klingenberg's name became well known far beyond the confines of his own country. Being able to demonstrate that his ideas were sound, it was notable, although under the circumstances not surprising, that by 1902, when he was only 32 years of age, he was appointed a director of the great Allgemeine Elektricitäts Gesellschaft, of Berlin, and the commencement of his association with this concern is generally considered to mark a new era in central electricity generating station design and construction. With the A.E.G. resources behind him, Klingenberg set out to thoroughly overhaul every section of central station work and design, from the method of storing and handling the coal to the distribution of the current, boiler-house arrangement coming in for a large share of his attention, as a result of which the *E. T. Z.*, to which we are indebted for the accompanying portrait, claims that the construction costs of power stations were reduced to less than half and their efficiency considerably increased. As further evidence of Dr. Klingenberg's unceasing activities, it may be mentioned that over 70 electric power stations have been built to his designs; of these a third are in foreign countries, one of the most notable being the four plants of the Victoria Falls Power Co. in South Africa, with a total capacity of 288,000 h.p. Another important installation was the Golpa power station of 128,000 kW, near Bitterfeld, Germany, which, when completed, was the largest steam-operated plant in the world. Dr. Klingenberg has not lived to see the completion of what was to prove his last and greatest work—the super power station on Lake Rummelsburg to meet Berlin's ever-increasing demand for electric power. Commenced in July last, this plant is to be completed by next autumn. Honours were showered upon him by the German Government and by the various technical institutions and scientific bodies. He had occupied the position of president of the Verband Deutsche Elektrotechniker, and there was hardly a technical commission or committee upon which he did not serve. It will be remembered that Dr. Klingenberg visited this country just prior to the war and put forward suggestions as to the way the problem of London's electricity supply should be tackled.

MR. R. T. BROWN.—Mr. Robert Thomas Brown, late of the West India and Panama Telegraph Co., Ltd., passed away at Westcliff-on-Sea on December 25th.

The funeral took place on December 30th of MR. ROBT. A BIRTLES, who had occupied the position of Chief Inspector of the Blackpool Corporation Tramways for 20 years. He entered the service of the Corporation in 1899 as a conductor. He was promoted to driver and then inspector and in six years rose to the position of chief inspector.

New Companies Registered.

Lydbrook Cables, Ltd. (210,609).—Private company. Registered December 23rd. Capital, £50,000 in 10s. shares. The objects are:—To carry on the business of chemical, civil, electrical, mechanical, mining, and radio engineers, manufacturers of cables and wires of all kinds, whether insulated or not, manufacturers of insulating materials, india-rubber and gutta-percha, vulcanisers, manufacturers of all electrical equipment and appliances, &c. The subscribers (each with one share) are:—F. B. Turner, 3-4, Clement's Inn, Strand, W.C.2, solicitor; J. F. H. Templer, 13, Inglis Road, Ealing, W.5, solicitor's clerk. The first directors are to be appointed by the subscribers. Qualification, 10 shares. Remuneration as fixed by the company. Solicitors: Brown, Quayle & Bentley Turner, 3-4, Clement's Inn, W.C.2. Registered office: Lydbrook, Glos.

Burndept Wireless (Dublin), Ltd.—Registered in Dublin as a "private" company on December 14th, with a nominal capital of £5,000 in £1 shares. The objects are to adopt an agreement, dated December 4th, 1925, between Burndept Wireless, Ltd., Aldine House, Bedford Street, Strand, London, and Thomas Hempenstall, 12, Suffolk Street, Dublin, on behalf of Dixon & Hempenstall, and carry on business of manufacturers of, and dealers in wireless, telegraph, telephone, optical, and photographic apparatus, &c. The first directors are:—W. Burnham, Chislehurst, Kent; T. Hempenstall, "Woodfield," Rathfarnham, Co. Dublin; C. Neild, 3, Mountain View, Ranelagh, Dublin. Secretary: John Love. Registered office: 17, Dawson Street, Dublin.

Moreland Electric Welding Co., Ltd. (210,650).—Private company. Registered December 24th. Capital, £4,000 in £1 shares. Objects: To acquire the business of electric and other systems or means of welding, electricians, mechanical engineers, &c. The subscribers (each with one share) are:—J. L. Walters, 19, The Walk, Cardiff, solicitor; T. A. Tyrrell, 42, Loftus Street, Cardiff, clerk. The first directors are C. G. Moreland (permanent director and chairman), and others to be appointed by the subscribers. Remuneration, as fixed by the company. Secretary (*pro tem.*): T. A. Tyrrell. Solicitors: Phœnix & Levinson, 8, Dumfries Place, Cardiff. Registered office: Dumfries Chambers, 8, Dumfries Place, Cardiff.

Hendon Electric Lamp Co., Ltd. (210,709).—Private company. Registered December 29th. Capital, £1,995 in 1,900 20 per cent. preferred ordinary shares of £1 and 1,900 deferred founders' shares of 1s. each. The objects are to acquire the business of a factor, agent and dealer in connection with electric lamps, and all other descriptions of electrical goods, &c., carried on by Mrs. K. E. Falcke at 104, Southampton Row, Holborn, as the "Hendon Electric Lamp Co." The subscribers (each with one share) are:—C. D. Falcke, A.M.I.E.E., 104, Southampton Row, W.C.1, electrical engineer; M. E. Cavendish, 52C, Fulham Park Gardens, S.W.6, manufacturer's agent. The first directors are to be appointed by the company or subscribers. Qualification, £10. Secretary: T. P. Jones, 9, Ferndale Road, Gillingham, Kent.

Holophane, Ltd. (210,826).—Registered on January 1st as a "public" company, with a nominal capital of £100,000 in £1 shares. The objects are to acquire the business of Holophane, Ltd. (incorporated in 1910), together with all or any of the assets, including trade marks, numbered 215,730 and 215,063, and liabilities in connection therewith, to adopt an agreement with the said old company and its liquidator, to acquire and turn to account interests in any invention relating to illuminating, appliances, toolmaking, brass and metal founding, and the production, treatment, storage, application and use of electricity, and of any apparatus therefor; to carry on the business of an electric light company; to manufacture illuminating appliances and light globes, &c. Minimum cash subscription, 7 shares. The first directors are:—Lord Ernest Hamilton, 87, Elm Park Gardens, S.W.10 (director of Khedivial Mail Steamship and Graving Dock Co., Ltd.); Otis A. Mygatt, 156, Boulevard Haussmann, Paris (director of Société Anonyme Francaise Holophane); Major Robert Woodhouse, 9, Wilbury Grove, Hove (director of Barclay's Bank, Ltd.); Lawrence E. Jones, M.C., 15, Clevelands Gardens, W.2, barrister; Herbert H. Thompson, Rowhiti, Devonshire Avenue, Sutton, Surrey (director of Holophane, Ltd.); Mons. André Froget, 156, Boulevard Haussmann, Paris (director of Société Anonyme Francaise Holophane). Remuneration, £200 per annum (chairman, £300), and 15 per cent. of the surplus profits earned by the company in each year remaining after paying 12 per cent. on the ordinary shares in respect of such year, but exclusive of any sum brought forward from any previous year. Maximum additional remuneration in any one year, £2,500, divided between them. Secretary: J. Wyatt Ife. Solicitors: Herbert Reeves & Co., 42, Old Broad Street, E.C.2. The registered office is at Elverton Street, Vincent Square, Westminster.

E. A. Langrish & Co., Ltd. (210,825).—Private company. Registered January 1st. Capital, £15,000 in £1 shares (7,500 8 per cent. cumulative preference and 7,500 ordinary). Objects:—To carry on the business of manufacturers, factors and importers of, agents for and dealers in electrical and wireless plant, machinery, apparatus, accessories and equipment, electrical engineers and contractors, &c. The subscribers (each with one share) are:—D. H. Raphael, 55, Ellesmore Road, Chiswick, W.4, clerk; H. W. Clayton, 28, Sackville Street, W.1, clerk. The first directors are not named. Save as provided by contract to the contrary, the shares (initial or otherwise) shall be under the control of the directors, who may allot or otherwise dispose of the same to such persons on terms and conditions and at such times as the directors think fit and with full power to give to any person the call of any shares either at par or at a premium and for such time and consideration as the directors think fit. Provided that after 5,800 ordinary shares shall have been allotted, E. F. Lyons shall have the right of subscribing and receiving an allotment of 500 ordinary shares at par and subject thereto no allotment exceeding 65 per cent. of the ordinary shares to be issued from time to time shall be made in favour of any single or joint shareholder or shareholders. Solicitors: J. J. Edwards & Co., 28, Sackville Street, S.W.1. Registered office: Primrose House, 26/7, D'Arblay Street, Wardour Street, W.

Featherstone & Davey, Ltd.—Private company. Registered in Dublin December 18th. Capital, £1,000 in £1 shares. Objects: To carry on business as electricians, electrical contractors, electrical and mechanical engineers, &c. The directors are:—L. Featherstone, 73, Kenilworth Square, Rathgar, Dublin, electrical engineer; J. A. R. Lloyd, 73, Kenilworth Square, Rathgar, Dublin, electrical engineer. Registered office: 43, Fleet Street, Dublin.

W. A. C. Pulverisers, Ltd. (210,637).—Private company. Registered December 24th. Capital, £8,000 in 7,000 10 per cent. cumulative preference shares of £1 each and 4,000 ordinary shares of 5s. each. Objects: To carry on the business of licensees, manufacturers and vendors of the W. A. C. Pulveriser as formerly carried on by A. J. Henderson, J. W. S. Asquith, A. J. Jack, and W. A. Cloud as the "W .A. C. Pulveriser Co.," and to carry on the business of mechanical, electrical, motor, gas, hydraulic, sanitary, construction, civil, consulting, and general engineers, &c. The subscribers (each with one preference share) are:—A. J. Henderson, 6, Wells Road, Regent's Park, N.W., consulting engineer; E. H. Clifton, 6, Hatfield House, Great Titchfield Street, W.1, gentleman; W. A. Cloud, 54, Airedale Avenue, Chiswick, W., mechanical engineer. The first directors are to be appointed by the subscribers. Qualification, 100 shares. Secretary: E. H. Clifton.

E. L. Bentley Company (210,593).—Registered as a "private unlimited" company on December 23rd, with a nominal capital of £100,000 in 40,000 10 per cent. cumulative preference shares and 50,000 ordinary shares of £1 and 400,000 deferred shares of 6d. each. The objects are to acquire all or any part of or any share, percentage or interest of and in the copyrights of Bentley's Telegraph and other codes, Scott's Code and other codes, and the goodwill of the business carried on in connection therewith, and to carry on the business of codists, manufacturers, compilers, publishers and printers of codes and other publications, &c. The subscribers (each with one ordinary share) are:—P. H. Bentley, Grove End, Bagshot, mechanical engineer; W. H. Bentley, "Sunny Cot," Upland Road, Sutton, telegraph codist. E. L. Bentley is permanent governing director. On his death, P. H. Bentley, H. B. Bentley, and W. H. Bentley, if living and hold 100 shares each, shall become permanent directors, with £1,200 each per annum as remuneration. Secretary: G. Bradley, 71, Queen Street, E.C. Solicitors: Kimber Bull, Howland, Clappe & Co., 6, Old Jewry, E.C.

A. G. Lewis & Co., Ltd. (210,624).—Private company. Registered December 24th. Capital, £1,000 in £1 shares. Objects: To acquire the business of a wholesale wireless dealer carried on by A. G. Lewis at 1, Beach Cliff, Penarth, Glam. The permanent directors are:—A. G. Lewis, "The Bungalow," Beach Cliff, Penarth, Glam., wholesale wireless dealer; R. Olney, 18, Princess Street, Barry, Glam., electrical engineer. Registered office: 7, Pembroke Terrace, Cardiff.

Helsby Cables, Ltd. (210,738).—Registered as a private company on December 29th with a nominal capital of £2 in £1 shares. The objects are:—To carry on the business of manufacturers of and dealers in wire cables and lines of all kinds, electricians, engineers, suppliers of electricity and electrical machinery and equipment, &c. The directors are:—J. Taylor, Colomander, Mold, North Wales, manufacturer; J. A. Smith, 1, Sefton Court, Croxteth Gate, Liverpool, director of British Insulated & Helsby Cables, Ltd. Solicitors: Hill, Dickinson & Co., 10, Water Street, Liverpool.

J.M.O., Ltd. (210,713).—Private company. Registered December 29th. Capital, £100 in 1s. shares. Objects: To carry on the business of engineers, advisers, experts, consultants, contractors and the like in connection with wireless telephony or telegraphy, &c. The first directors are:—Jose M. Ortega (permanent managing director), Upper Wandle House, Wandsworth, S.W.18; Mrs. Florence M. Ortega, Upper Wandle House, Wandsworth, S.W.18. Qualification, 1 share. Remuneration as fixed by the company.

G. W. M. Electrical Co., Ltd. (210,701).—Private company. Registered December 29th. Capital, £100 in 5s. shares. Objects: To acquire the business of wholesale and retail dealers in and manufacturers and factors of electrical, radio and motor accessories now carried on at 43, Grafton Street, Tottenham Court Road, W.1. The permanent directors are:—A. B. Gregory, 29, St. Albans Road, Seven Kings, Essex; B. G. Williams, 6, Parliament Hill, Hampstead, N.W.; E. Morgan, "The Poplars," Mawneys Road, Romford, Essex. Secretary: E. Morgan. Registered office: 43, Grafton Street, Tottenham Court Road, W.1.

R. L. S. Syndicate, Ltd. (210,614).—Private company. Registered December 23rd. Capital, £5,000 in £1 shares (4,000 ordinary and 1,000 deferred). Objects: To acquire the benefit of an agreement between C. G. Moller and J. Balfour Brown for the acquisition by the latter of certain British and foreign patent rights of S. G. Moller's patent rotary luminous sign. The first directors are:—F. V. Spooner, The Cavalry Club, 127, Piccadilly, W. (managing director of Slogasigns, Ltd.); J. Balfour Brown, 193, Mitcham Lane, Streatham, S.W.16 (director and secretary of Slogasigns, Ltd.). Qualification, 10 shares. Secretary: J. Balfour Brown. Registered office: 20, Grosvenor Gardens, S.W.1.

E. P. Allam & Co., Ltd. (210,698).—Private company. Registered December 29th. Capital, £6,000 in £1 shares. Objects:—To acquire the business of an electrical engineer, contractor and manufacturer, carried on by E. P. Allam at 107 and 109, Gray's Inn Road, W.C.1. The directors are:—E. P Allam, "Norton Garth," Gidea Park, Essex, electrical engineer; E. B. Allam, "Norton Garth," Gidea Park, Essex, electrical engineer. Qualification, £10 shares. Secretary: E. T. Sheppard. Solicitors: Cohen, Dunn, Page and Moore, Audrey House, Ely Place, E.C.1. Registered office: 107 and 109, Gray's Inn Road, W.C.1.

Electrolines, Ltd. (210,743).—Private company. Registered December 30th. Capital, £1,000 in £1 shares. Objects:—To acquire the business of an electrician and manufacturer of and dealer in wireless fittings now carried on by A. E. Finch at 5, Denmark Street, Bristol, and to carry on the same and the business of opticians, optologists, spectacle, opera glass, field glass and optical lantern makers, &c. The first directors are:—C. Jarrett, Maybury Villas, Keynsham, Somerset; E. Lewis, Sonoma, Abbots Leigh, near Bristol; A. E. Finch, 9, Denmark Street, Bristol. Solicitors: David Johnstone & Co., Bristol.

Detex Distributors, Ltd. (210,751).—Private company. Registered December 30th. Capital, £2,000 in £1 shares. Objects:—To adopt an agreement with Detex, Ltd., for the sole selling agency in the U.K. and Ireland of "Detex crystals," and to carry on the business of wireless agents, manufacturers, importers and exporters of and dealers in wireless instruments, parts and goods, &c. The subscribers (each with one share) are:—L. E. Parsons, 108, Victoria Street, S.W.1, insurance broker; C. A. E. Knust, 108, Victoria Street, S.W.1, insurance broker. The first directors are:—L. A. Bennett, W. T. Asher and R. Eiser. Qualification, 25 shares. Remuneration as fixed by the company. Secretary: W. T. Asher, 196, Ribbledale Road, Streatham, S.W.16.

Official Returns of Electrical Companies.

X. L. O. Co., Ltd.—W. C. Norrington-Wood, of 22, St. Stephen's House, Westminster, S.W., was appointed receiver and manager on November 27th, under powers contained in debenture dated July 9th, 1925.

Frederick Braby & Co., Ltd. (2,537c).—Capital, £660,000 in 42,500 ordinary, 17,500 preference, and 6,000 employés' shares of £10 each. Return dated September 1st, 1925. 39,500 ordinary, 14,500 preference, and 4,500 employés' shares taken up and fully paid. Mortgages and charges, £31,000.

Telephone Manufacturing Co., Ltd.—Particulars filed of £10,000 debentures and premium of 2 per cent. authorised December 3rd, 1925, and covered by trust deed dated February 17th, 1922, and endorsement thereon, dated December 16th, 1925, and ranking *pari passu* with £300,000 already registered, the whole amount being now issued. Property charged: The premises comprised in said trust deed. Trustees: London City and Midland Executor and Trustee Co., Ltd., 5, Princes Street, E.C.2.

Electric Light and Power Contracts Finance Corporation, Ltd.—Particulars filed of £50,000 debentures and premium of 5 per cent. authorised by resolutions of November 30th and December 3rd, 1925, charged on the company's assets, present and future, including uncalled capital, the whole amount being now issued.

Electric Reduction Co., Ltd. (54,724).—Capital, £50,000 in 16,200 preference and 33,800 ordinary shares of £1 each. Return dated November 23rd, 1925. 16,200 preference and 28,800 ordinary shares taken up. £18,000 paid on 13,000 preference and 5,000 ordinary shares. £27,000 considered as paid on the remainder. Mortgages and charges, £25,000.

Implitico, Ltd. (138,160).—Capital, £3,000 in £1 shares. Return dated December 2nd, 1925. All shares taken up. £3,000 paid. Mortgages and charges, nil.

Empson Electrical Engineering Co., Ltd. (188,208).—Capital, £2,000 in £1 shares. Return dated August 7th, 1925. All shares taken up. £500 paid. £1,500 considered as paid. Mortgages and charges, nil.

Kidderminster and District Electric Lighting and Traction Co., Ltd. (59,972).—Capital, £100,000 in 5,000 preference and 5,000 ordinary shares of £10 each. Return dated June 30th (filed November 4th), 1925. 3,000 preference and 4,700 ordinary shares taken up. £77,000 paid. Mortgages and charges, nil.

Newton Bros. (Derby), Ltd. (139,711).—Capital, £76,000 in 75,000 ordinary and 1,000 employés' shares of £1 each. Return dated October 14th, 1925. 75,000 ordinary shares taken up. £30,000 paid. £45,000 considered as paid. Mortgages and charges, £62,000.

J. G. White & Co., Ltd. (66,568).—Capital, £350,000 in 400,000 ordinary shares of 5s. each and 70,000 ordinary and 180,000 preference shares of £1 each. Return dated October 9th, 1925. 400,000 5s. ordinary and 180,000 preference shares taken up. £200,000 paid on 150,000 preference and 200,000 ordinary shares. £80,000 considered as paid on 30,000 preference and 200,000 ordinary shares. Mortgages and charges, nil.

St. Austell and District Electric Lighting and Power Co., Ltd. (66,382).—Capital, £20,000 in 13,000 preference and 7,000 ordinary shares of £1 each. Return dated October 19th, 1925. 3,000 preference and 6,152 ordinary shares taken up. £9,002 paid (being £1 per share on 3,000 preference and 5,552 ordinary, and 15s. on 600 ordinary shares). Mortgages and charges, £1,850.

Baxter & Caunter, Ltd.—Satisfaction to the extent of £300 on February 23rd, and to the extent of £400 on December 3rd, 1925, of debenture and mortgage, both dated June 23rd, 1924, securing £5,000. (Notice filed December 23rd.)

Specialities (Liverpool), Ltd.—C. M. Delby, of 51, North John Street, Liverpool, ceased to act as receiver or manager on December 17th, 1925.

Lustrolux, Ltd.—Debenture dated December 10th, 1925, to secure £5,000, charged on the company's undertaking and property, present and future, including uncalled capital. Holder: O. W. Porritt, Torside, Helmshore, Lancs. Also second mortgage debenture of the same date to secure £3,000, charged on the company's undertaking and property, present and future, including uncalled capital (subject to above debenture). Holder: W. L. Turner, Abbey Manor, West Kirby, Cheshire.

Reflex Radio Co., Ltd.—Particulars filed of £1,000 debentures authorised December 15th, 1925, charged on the company's property, present and future, including uncalled capital, the whole amount being now issued.

Izzard Brothers, Ltd.—Particulars filed of £1,500 debentures authorised December 15th, 1925, charged on the company's property, present and future, including uncalled capital, the whole amount being now issued.

Walker, MacEwen & Co., Ltd.—E. L. Holford, of 41, Nightingale Road, Wanstead, E.11, was appointed receiver on December 22nd, 1925, under powers contained in debentures dated November 30th, 1922.

Walbar Engineering Co., Ltd.—Debenture dated December 11th, 1925, to secure £250, charged on the company's property, present and future, including uncalled capital. Holder: H. Langley, 96, Lightcliffe Road, Huddersfield.

City Notes.

Reports and Meetings of Electrical Companies, Dividend Results, &c.

Marconi's Wireless Telegraph Co., Ltd.

The directors have announced that it is not proposed to pay an interim dividend on the ordinary shares. The preference dividend for the latter half of 1925 was paid on January 1st. The passing of the interim ordinary dividend is due to circumstances which are set forth in a circular issued to the shareholders, and to the necessity of conserving to the utmost the cash resources of the company to meet the great programme of expenditure. The circular reads as follows:—

"Shareholders have from time to time been informed that the company was engaged in negotiating with the Postmaster-General a licence for the conduct of telegraph services between Great Britain and foreign countries. The directors are glad to be able to state that these negotiations have now been brought to a satisfactory conclusion and that the agreement embodying the terms of the licence was signed yesterday (December 31st). In addition to the services which the company has been conducting with France, Spain, Switzerland, Austria and the United States, it is now licensed to conduct services with the following European countries: Denmark, Sweden, Finland, Russia, Portugal, Jugo-Slavia, Bulgaria, Turkey and Greece, and with all foreign countries outside Europe. Your directors feel sure it will be a source of gratification to the shareholders to know that after so many years of discussion, the company is at last in a position to proceed with the establishment of a world-wide wireless telegraph service.

"The Beam stations which the company is erecting for the British Government and for the Governments of the Dominions and India, are making satisfactory progress. It had been hoped that the Canadian and South African stations would be ready for working by the end of 1925, but their completion has been delayed by the illness of Senatore Marconi and Mr. Franklin. In spite of this handicap, Senatore

Marconi and his staff have been able, since the work of construction commenced, to make some important improvements in short wave communication which are to be embodied in the new stations. These changes have involved further delay, but your directors are confident that the result will be to make the stations more efficient and to secure for the company a larger revenue than was originally anticipated. The directors are of opinion that the Beam services between this country and Canada and South Africa should be ready for working in April next, and that the services with India and Australia will be in operation about the middle of August. A Beam station is being erected at Dorchester for communication with the United States and with South America. A corresponding station is being built in Brazil for the account of the consortium of the four Wireless Companies operating in South America. The company is also constructing stations connecting Portugal and her Colonies and linking up Portugal with the rest of the world.

"This programme of construction involves the expenditure of approximately £1,000,000 sterling. At no time in the history of the company has so much work been in hand in connection with the establishment of telegraphic services.

"At the last general meeting the managing director stated that the Board had determined to make such reductions in the company's expenditure as were possible without reducing the efficiency of the company's organisation. Reductions have already been made, and continue to be made at every possible opportunity, but the full effect will only be partially reflected in the accounts of 1925. A good deal has already been done to carry out the undertaking given at the last general meeting to close down those subsidiary companies which appeared to the Board not likely to become profit-earning in any reasonable period of time and the Board has also taken the necessary steps to reorganise other subsidiary companies whose results up to the present have been unsatisfactory. The sales side of the company's business continues to show satisfactory results.

"The preparation of the company's case for submission to arbitration in connection with its claim against the Government for the use of its patents by the fighting forces, before, during and since the war, has made a considerable advance, but the amount of work involved is so great that it is impossible to give any definite date when this will be completed. No effort is being spared by the company or the Government Departments to expedite the hearing.

"In consequence of your Board's efforts to effect a reduction in expenditure on the telegraph services, a lightning strike took place on November 2nd. The matter was referred by the company to the Engineering and Allied Employers' London and District Association, and a provisional agreement was arrived at whereby the telegraphists returned to duty pending further discussion. These discussions have not yet led to a satisfactory settlement. A strike has also taken place of the operators in the employ of the Marconi International Marine Communication Co., Ltd., in which company the Wireless Company is a large shareholder. This strike was declared by the same Union as was responsible for the lightning strike at Radio House and is still proceeding."

Tata Power Co. In their report for the year ended June 30th last, the directors state that they have acquired practically all the land required for the works, except the transmission line, for which 60 out of 76 miles has been acquired. The progress on the dam has been satisfactory, and it is hoped that the masonry will be of sufficient height by June, 1926, to permit of the supply of power. Sufficient pipes have been received to allow of two generators being put into commission. About half of the generating station has been completed and some machinery has been received. At the receiving station a commencement has been made with the erection of switchgear. At the end of the year under review the unpaid calls amounted to Rs.137 lakhs, but since then Rs.13 lakhs has been paid up.

Leicestershire and Warwickshire Electric Power Co.—It is reported that the company is seeking Parliamentary powers to raise its capital by the creation of £500,000 in £1 ordinary shares, and to increase its borrowing powers by £122,970. It also seeks to obtain the power to further increase its borrowing powers by means of Special Orders. The company also proposes to divide its £10 ordinary shares into £1 shares.

Edison Swan Electric Co., Ltd.—At an extraordinary general meeting on January 4th resolutions were confirmed authorising the sub-division of the unissued £1 ordinary shares of the company into shares of 4s. each.

C. A. Vandervell & Co., Ltd.—It is reported that more than 75 per cent. of the holders of each class of share have accepted the offer to purchase their holdings made by Messrs. Thomson, McLintock & Co.

It is stated that the offer was made on behalf of Messrs. Joseph Lucas, Ltd., and that there will be no change in the management of the concern.

Crompton & Co., Ltd.—An interim dividend at the rate of 7 per cent. per annum on the preference shares for the half-year ended September, 1925, is payable on January 9th.

Stock Exchange Notices.—The undermentioned securities have been ordered to be officially quoted:—

Telephone Manufacturing Co.—£10,000 eight per cent. cumulative income bonds of £100 each, Nos. D1 to D100 (registered).

Stocks and Shares.

MONDAY EVENING.

IN the endeavour, usually made at this time of year, to forecast in some rough shape the manner in which Stock Exchange markets may be expected to move, the natural temptation is to lean to the optimistic side. Everybody hopes for the best. Common or garden charity dictates a sympathetic desire that prices may rise for the sake of those people who hold the stocks and shares. Nor, speaking "big and large," as the modern repetition of an old phrase says, is there any tangible reason for anticipating that prices should proceed in a way other than satisfactory to the holders of securities. Despite the 5 per cent. Bank Rate, money is the reverse from being tight. The course of trade, national and international, is still too sluggish for it to demand any but normal supplies of cash with which to finance its requirements.

The prospect for the prices of Home Railway and London Traction issues is not encouraging. The Underground group approaches the limit of its present capacity for expansion. "Pirate" 'bus competition has an influence upon the takings of the Combine. The latter is run by men of energy, experience, and imagination. Yet the return upon the large amount of capital invested in this group is meagre, and there will be no such adventitious Wembley aid as the last two years have provided. It is to be hoped, however, that a start will be made this year in the reorganisation of the capital account of the Underground Electric Railways of London, hitherto hung up by the divergence between the London and the New York rates of exchange.

Brazilian Tractions are not likely to enjoy another such dramatic rise in value as that which occurred in 1925. The bull bases his impression of further advance upon the persistent report of American-Canadian interests buying the shares for control. Confident anticipation of a rise in the dividend is always a factor, and so is, of course, the consideration that the company is doing well. The Mexican group of utility companies must depend for their progress upon the political and financial march of events in the country. Contrary to a general hope, the recognition of Mexico by Great Britain has led, so far, to little change in the immediate outlook.

British Columbia Electric stocks can be looked upon as sound speculative investments. The company goes ahead, in Vancouver, with the same steady persistence as characterises the soundly-managed British Electric Traction Company at home.

The New Year is bound to witness important developments in connection with the London electricity supply industry. Optimism talks with no hesitating tongue of the dividend declarations so soon to be announced in respect of 1925. Again, the far-reaching changes that will come about so shortly by the operation of the new Parliamentary Acts are thought likely to benefit share prices. Some of these have been put up well ahead of the actual event. If the various rearrangements of capital result in the provision of additional shares in which to deal, this will be of distinct advantage to a market which, for years past, has suffered from the disability of a restricted supply of stock with which to satisfy would-be investors. The group will be extended by the admission into it of shares, &c., in various provincial undertakings. Rumour plays with the idea that Americans are already endeavouring to obtain a footing in British electricity supply, through the medium of lighting and power undertakings well outside the London area.

While the cable companies, embarked upon a policy of strict retrenchment of expenses, can be expected to maintain earnings and dividends, it is hard to say what the immediate future holds in store for the wireless concerns. One of the few Stock Exchange disappointments last year was furnished by the gradual dwindling in the price of Marconis. A strike of wireless operators was a kind of last straw, but prices have now descended to such low levels as seem to make a sale indiscreet. The rubber boom, which formed the outstanding feature of last year's markets, laid a check upon the previous hectic rush in the shares of various cable equipment companies. This check proved to be little more than temporary. Prices in the cable section, and in that for electrical manufacturing shares, are very hard. The buying has been mainly of the investment order, and the shares purchased were paid for by the supporters. This suggests the possibility of further improvement, although there are not wanting cautious folk to indicate the substantial character of the rise as a reason for not anticipating much more advance at present. There is, however, a spice of speculation in this particular department owing to the rapidity of changes which take place in the realms of labour, politics, trade, and finance. "One never knows," says the Stock Exchange platitude.

Lloyd's Register Scholarship.—A scholarship is annually awarded by Lloyd's Register of Shipping, worth £100 a year for three years, to a junior engineer or apprentice, as the result of a competitive examination. Particulars can be obtained from the Institute of Marine Engineering, 85-88, The Minories, London, E.1. Application must be made before March 10th.

A New Electrically-operated Fire Vehicle.—The latest turntable ladder fire vehicle introduced by Messrs. Tilling-Stevens Motors, Ltd., Maidstone, constitutes a formidable British challenge in a field hitherto successfully held by Continental makers, and again exemplifies the adaptability of the Tilling-Stevens petrol-electric propelling plant to duties requiring a supply of electricity. Known as type TTL2, the new vehicle utilises a T84 petrol-electric chassis with a four-cylinder engine developing 50-60 h.p., coupled direct to a compound-wound dynamo which supplies current to a series-wound motor driving the worm back axle through a propeller shaft. Consisting of one main and three sliding sections, the ladder is elevated by a motor with a vertical armature driving, through two sets of enclosed worm gear, a horizontal shaft with which are connected a pair of drums bearing twin steel-link elevating chains. The final 2 ft. of extension is accomplished at half speed, this being obtained by the introduction of resistance in the circuit. A dial indicator calibrated at 5-ft. intervals is provided in front of the operator, and is furnished with means whereby, when the ladder has attained any pre-determined height, the current is automatically cut off from the motor. A separate motor is employed for the operation of the ladder turntable, which is mounted directly above the back axle.

Conditions and Prospects in India.

Important Public Works.

MR. THOMAS M. AINSCOUGH, C.B.E., Senior Trade Commissioner in India and Ceylon, has forwarded a report on the conditions and prospects of British trade in India* to the Department of Overseas Trade. In a general review of the fiscal year 1924-5, Mr. Ainscough says that a general improvement was shown and the progress towards normal conditions was satisfactory. This improvement was very greatly contributed to by the improvement in the political situation and the subsidence of agitation. It is stated, however, that although the general economic condition of India is steadily improving, the import trade remains depressed and the future is still obscure. Competent observers have repeatedly emphasised the truism that so long as the Indian *rayat* is only receiving increased prices of little more than 30 per cent. for his produce, he cannot afford to purchase normal quantities of imported goods at rates varying from 100 to 170 per cent. higher than those ruling before the war.

So far as the engineering trades are concerned, the future largely depends on the progress of important public works, such as railway, irrigation, harbour, dock, canal, and hydro-electric schemes. In the iron and steel trade British exports are adversely affected by Continental competition, and to a lesser degree by the recent Indian protective tariff upon steel.

Foreign Competition in Import Trade.

In certain directions German competition in the import market has become prominent. In 1913-14 the German share of Indian import trade was 6.9 per cent. In 1923-24 it was 5.2 per cent., and during the following year it rose to 6.3 per cent. Mr. Ainscough says that he can find no foundation for the statement that the Germans are re-introducing extended credit terms and are giving better facilities than their British competitors. The share of Belgium in the import trade has remained fairly steady, at between 2.3 and 2.8 per cent. Over 60 per cent. of this consists of iron and steel manufactures which compete seriously with British products. American exports, after advancing steadily during and immediately after the war, declined considerably between 1920 and 1924, although they rallied slightly during the year under review. One of the principal items supplied by the United States is electrical instruments and apparatus, and American competition is also very keen in electrical machinery and in those types of machinery and tools where the large domestic market of the United States has enabled the American makers to standardise, and so reduce prices.

Electrical Imports.

The following table reproduced from the report shows the total imports of electrical machinery and the countries of consignment for the past three fiscal years :—

Countries of consignment.	1922-23. Rs. (lakhs).	1923-24. Rs. (lakhs).	1924-25. Rs. (lakhs).
United Kingdom ...	2,00	1,64	1,77
Germany	6	4	4
United States	38	41	15
Other countries	16	13	6
Total	2,60	2,22	2,02

It is considered most satisfactory that British manufacturers have increased their share of the trade at the expense of American and Swedish competitors. This, it is stated, is very largely due to the splendid service given by the Indian branches and agencies of the leading home stores, most of which employ highly qualified engineers and salesmen, who are continually touring the country and keeping in close touch with every project. Competition among them is very keen, and there is a great deal of price cutting, but the result is that foreign competition is not allowed to become really serious. The falling away in the total trade is largely due to reduced imports of motors, generators, transformers and turbo-generators. The unclassified imports, however, rose by nearly 29 lakhs. The most serious decline was in the case of motors, the value of which fell from 72 lakhs in 1913-14, to 40 lakhs in 1924-25. The development of railway electrification in India, which is dealt with subsequently, will provide an increasing market for electrical plant. British makers have supplied machinery, cables and apparatus for the first section of line to be electrified in India, *viz.*, the G.I.P. local service in Bombay.

The total value of imported electrical apparatus in 1924-25 was 197 lakhs, as compared with 226 lakhs in 1923-24. The most important item was electric wires and cables, which were valued at 67 lakhs as against 70 lakhs. By far the largest proportion of this apparatus came from the United Kingdom; Germany occupied the second place in 1924-5, supplanting the United States in this position.

Indian Stores Department.

It is the avowed policy of the Government of India to develop the purchase of stores as far as possible in India, granting a preference to articles manufactured, or partly manufactured, in the country and utilising the activities of the recently created Indian Stores Department, to stimulate the local manufacture of such articles. This department has already carried out a good deal of work, and it is stated that a notable advance has been made in the direction of authorising the purchase in India, from the branches and agencies of foreign manufacturers established in the country, of engineering plant and machinery, whether stocks are held in the country or not, and the department has thus been enabled to purchase at economic prices in India a considerable quantity of engineering plant and machinery which otherwise would have had to be purchased from England. The purchases covered by the department consist of a wide range of stores, and include complete electric power plants, railway materials, &c. During the past year the engineering branch purchased plant and materials for electrical installations to the value of Rs. 10,32,060. It is of interest to note that one item in which the United States has a monopoly is locomotive headlights. The report says that it is most unfortunate that British makers have not specialised in this type of fitting. One or two firms have been in negotiation with the Railway Board, but it seems doubtful whether they will be able to produce a suitable article and have it tested before the American lights are installed. The Director-General of the Department of Posts and Telegraphs, in his report for 1923-4 states that a tentative order for 100 tons of hard-drawn copper wire was placed in December, 1923, with the Indian Cable Co. of Jamshedpur (a concern managed by a British company) and that satisfactory deliveries were made during 1924. The Calcutta Pottery Works has increased its output of insulators, and it is hoped that in the near future this firm will be able to meet the entire requirements of the department for insulators, the annual value of which is about 5 lakhs. The services of the Indian Stores Department in Delhi-Simla are now being utilised to an increasing extent, and such items as oils, electric light and fan fittings, and various other stores, are now purchased through this agency.

Hydro-Electric Development, &c.

Work on the Lloyd Barrage made satisfactory progress during the year under review; a considerable quantity of plant arrived and was erected; the power house to supply electrical energy to works and township buildings, was in course of construction; and the first power unit was to be erected shortly. The report contains a list of plant which it is intended to purchase during the year 1925-6. This includes electric derrick and "Goliath" cranes, centrifugal pumps with electric motors, motors and starters, three 500-h.p. Diesel engines and alternators, transmission lines, township lighting equipment, &c. Considerable extensions are being carried out at the Port of Calcutta, and a great deal of up-to-date cargo handling machinery is being installed. The hauling gear of the sliding caissons and the capstans and penstocks at the entrances to King George's Dock will be operated hydraulically, but all other equipment will be operated electrically. For the supply of electrical energy the Port Commissioners have recently entered into a contract with the Calcutta Electric Supply Corporation, which is building and equipping a 12,000-kW generating station in the vicinity of King George's Dock. In case of accident in connection with this source of supply, current will be available from the present source, *viz.*, the Corporation's station at Cossipur, nine miles away, whence it is conveyed at a voltage of 30,000, transformed by the Calcutta Electric Supply Corporation to 6,000 volts, and by the Port Commissioners to a working voltage.

During 1925 the Punjab Legislative Council made the necessary grant of funds for the first year for the Punjab hydro-electric scheme (known as the Mandi project). With the exception of one or two minor details all the preliminary work has been carried through, and the engineer in charge hoped to commence work in the autumn of 1925. The project makes use of the snow-fed waters of the river Uhl, which joins the river Beas in Mandi State. The water will be carried through 2½ miles of 9-ft. diameter tunnel through solid granite, and then dropped through a fall of 1,800 ft. to the first power station, where 36,000 kW can be generated. The construction of a comparatively small dam on an excellent site will increase the available power to 70,600 kW. From this point the water can be taken through three miles of open duct and dropped through a second fall of 1,200 ft., generating another 40,000 kW, making a total development of 118,600 kW, which is more than sufficient to meet the present demand in an area extending from Delhi in the south to Sialkot and Lyallpur in the north. There is also a third fall of 750 ft. which can be developed later if required, but this has not yet been surveyed. There is a sufficient market for power at present in existence to justify the first stage of the project and many promises have already been received to meet the annual expense for the first five years. The Government intends, therefore, to proceed at once with the construction of the first stage of the scheme, but to limit the transmission of power to certain towns. The construction of the project necessitates the provision of permanent railway communication with the power station. A meter gauge tramway will therefore be constructed from the existing rail head at Mukerian through the Kangra Valley, which has for many years been in need of improved communi-

* Stationery Office. 5s. 6d. net.

cations. The first stage of the project also includes a fund for assisting mill owners to install electrical equipment in mills on the hire-purchase system, at cost price, thereby encouraging the rapid replacement of steam by electricity as soon as the scheme has been completed. The cost of this first stage, including the tramway, local distribution, and the mill-owners' fund, amounts to Rs. 557 lakhs. It is expected that the scheme will take about 2½ to 4 years to construct. In the second stage of development, it is proposed to extend the transmission system so as to supply Simla, Ambala, Patiala, and other towns. This will render necessary the erection of a dam. The third stage of the scheme will carry power as far as Saharanpur, Meerut and Delhi. British manufacturers of the types of plant which will be required are advised to place themselves in touch with Lieut.-Col. B. C. Battye, D.S.O., R.E., Chief Engineer, Hydro-electric Circle, Punjab Government, Benmore, Simla.

Railway Electrification.

The first line to be electrified in India, reference to which has been made, was opened for service on February 3rd, 1925. The electrified section of the G.I.P. railway runs from the Victoria terminus, Bombay to Kurla, *viâ* the Harbour branch. In 1904 the problem of increasing the capacity of the G.I.P. suburban line received consideration, but the schemes now in progress did not take definite shape till 1913, when a well-known firm of consulting engineers advised the electrification of certain sections. The work was held up by the war, but projects for the electrification of the harbour branch and Mahim Chord, and of the Bombay-Thana section were accepted by the Secretary of State in August, 1922, while approval of the scheme from Thana to Kalyan was received in June, 1923. The work has been carried out by British engineers and the plant and equipment was almost entirely supplied by well-known British firms.

The B.B. & C.I. Railway Co. is also engaged on an extensive scheme of suburban line electrification in Bombay. Important contracts have been awarded to British firms, and the work will be pushed forward as rapidly as possible. In Calcutta the electrification of the suburban section of the Eastern Bengal and East Indian railways is also being considered. There is little doubt that railway electrification in India will be greatly extended in the future. Mr. Ainscough says that British manufacturers have secured a strong position by the excellence of the material and plant supplied on the first contracts.

Radio-Telegraphy and Telephony.

In March, 1925, the Indian Radio Telegraph Co., Ltd., was registered, with an authorised capital of 3 crores of rupees. The company was formed to erect radio-telegraph and telephone stations under Government concessions. It is intended in the first instance, to erect a station at Kirkee, near Poona, for the purpose of transmitting and receiving messages to and from Great Britain. It will be of the "beam" type, and the British Government has agreed to erect a similar station in England. The station was expected to be ready for service nine months from the date of the final approval of the plans by the Government and the acquisition of the site.

Broadcasting in India is still in its infancy and has not yet been carried out on a commercial scale. Radio clubs have been formed in some of the principal cities and experimental programmes are transmitted. Certain definite recommendations have been made by interested parties, to the Government, and as a result of these the Government has stated its willingness to grant a licence to a broadcasting company, subject to certain conditions.

So far the bulk of imports of radio apparatus has been of British origin; at present no apparatus is made locally, but possibly sets may be assembled locally from imported component parts. The foreign competition so far encountered is mainly from the United States, France and Germany.

Radio Apparatus in Latvia.—Under Clause 5 of the regulations governing the purchase and use of radio apparatus, issued by the Latvian Government, foreign radio sets and accessories may be acquired if such apparatus is not made in Latvia or is made in insufficient quantities. Periodical lists of this permitted apparatus will be published. A translation of the first list, supplied by the Department of Overseas Trade, includes "receiving apparatus with not more than four valves, as well with 2-4 valves (*sic*), without re-generation on first or second valves," in addition to a great number of parts and accessories, as transformers, valves, telephones, loud speakers, condensers, &c.

Power Station Radio Communication System.—The Italian Government has recently granted a concession to the Società Italiana Ernesto De Angeli, of Milan, to establish six wireless transmitting and receiving stations in connection with the electric power station at Ardesio (Bergamo) and at the transformer and distribution-sectionising stations at Ponte Nossa (Bergamo), Casellazzo (Milan), Legnano, and Milan. The purpose of the stations is to transmit by radio operating instructions to the engineers in charge at the different stations. The concession, which is run for a period of ten years, authorises a wave-length of 1,000 metres for the Bonate Supra and Castellazzo installations and 1,750 metres for the others. Messages are only to be transmitted between the hours of 7.30 and 9.30 a.m. and between 4 to 6 p.m., although in cases of emergency messages may be transmitted at any other time. The installations are stated to be the first of their kind in Italy.

The Import Trade of Siam.

THE following figures, showing the imports of electrical and similar goods into the port of Bangkok during the year ended March, 1925, are taken from the recently-issued official trade statistics; the figures for the year ended March, 1924, are included for the purposes of comparison, and notes of any increases or decreases are given. Imports stated to be from Singapore and Hong-Kong are for the most part the products of other countries shipped *viâ* these two ports:—

The Performance of Radio Amplifiers.

Summary of the Radio Research Board's Experiments.

(*Abstract of Paper read before the* WIRELESS SECTION *of the* INSTITUTION OF ELECTRICAL ENGINEERS.)

THE paper by Mr. H. A. Thomas, M.Sc., describes the researches carried out at the National Physical Laboratory for the Radio Research Board. A standard method of testing the amplification and input impedance of an amplifier is described, and the theory of the load introduced by the amplifier as well as by reaction is shown to agree with the observed results. Unfortunately, any combination of valves used for amplifying, note-magnifying, and/or rectifying, is commercially regarded as an amplifier. Such an arrangement will be termed an "amplification system," and the term "amplifier" will be applied only to a combination of components fulfilling the purpose of pure high- or low-frequency amplification. Unless otherwise stated, the terms will include all battery and output connections, *i.e.*, the complete assemblage. The performance of any amplifier must be expressed in terms of three distinct properties :—(1) Its voltage amplification; (2) its effect upon the circuit to which it is connected, and (3) its distortion of wave-form, but the experimental work carried out has been insufficient for an attempt to be made to correlate any one property with any other. Valve noises, which in a multi-stage audio-frequency amplifier usually determine the limiting number of cascade valves, are not dealt with, being more a matter of valve design.

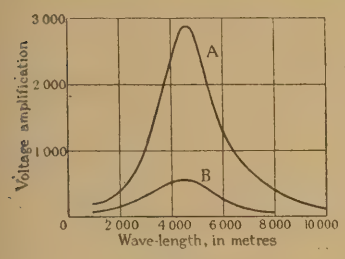

Fig. 1.

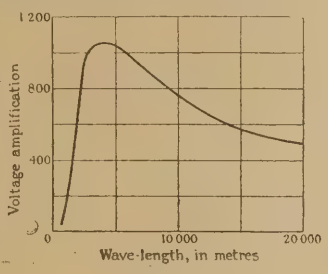

Fig. 2.

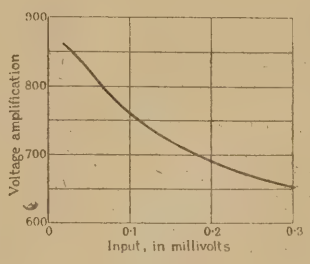

Fig. 3.

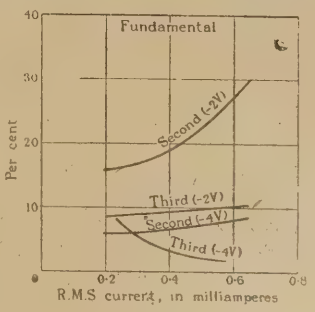

Fig. 4.

Section I. deals with the measurement of voltage amplification and the results obtained show that so far as high-frequency amplification is concerned, apparently the net effect of the many factors which can only be approximated in design gives very variable figures for amplification. As an example two apparently identical 3-stage amplifiers, transformer coupled, gave the results shown in fig. 1. In curve A it is apparent that retroaction effects combine to increase the overall amplification, whereas in curve B the phasing is such as to reduce the amplification. Since such retroactive effects form an inherent property of any amplifier and are dependent upon inter-electrode capacities, stray lead capacities and leaks, it is reasonable to expect large variations between amplifiers built to similar specifications.

Fig. 2 gives the overall voltage amplification of a 6-stage resistance-capacity amplifier, which shows that below 4,000 m. the shunting effect due to the self-capacity of the anode resistances seriously reduces the amplification. The more gradual fall at higher wave-lengths is attributed to the fact that the coupling condensers are not large enough at the lower frequencies. Fig. 3 gives the amplification of a 6-valve untuned transformer-coupled amplifier with various inputs on the grid, from which it will be observed that the amplification appears to fall with increasing input. It has been stated by several authorities that the voltage amplification falls with weak inputs, but the inputs for which this effect is claimed are of the order of a few microvolts and are smaller than any input measured here. The curve in fig. 3 may therefore bend back to the origin, but no measurements have been taken to confirm this. The evidence for this effect may depend upon distortion which will seriously affect the r.m.s. value of the current and may not be a genuine reduction of amplification of the fundamental. The discrepancies arising due to a neglect of the harmonics present may be very serious. The behaviour of the detecting valve departs only very slightly from the theoretical square law; in fact, this law can in most instances be assumed.

The measurement of the voltage amplification of a low-frequency amplifier presents less difficulty. The inter-electrode impedances at low frequencies are large and their shunting effects almost negligible. Induction can be entirely eliminated with care, and measurements to less than ½ of 1 per cent. can be obtained. Several standard audio amplifiers were tested at a frequency of 1,000, and it was found that the overall amplification of several cascade stages was less than the product of the individual stages. A special experimental 2-stage amplifier was built with which very consistent results could be obtained. The effect of the high-pressure condenser of several microfarads was very pronounced, the amplification falling considerably when a smaller condenser was used, probably due to the resistance of the h.p. battery. Inserting a small capacity of 100-1,000 $\mu\mu$F between the two windings of the transformer slightly increased the amplification, due te the increase in the electrostatic coupling between the windings; a capacity of 1,000 $\mu\mu$F increased the amplification by 5 per cent. These tests show that it is possible to construct a 2-stage amplifier in which little loss takes place, if the components are judiciously separated. The maximum may be obtained, if separate high-pressure batteries be used for each stage without the use of a high h.p. condenser. Separate low-pressure batteries produce an increase of 4 per cent. in overall amplification.

The input impedance of an amplifier is studied in Section II; the amplifier may be considered as a resistance and capacity in series forming a load across the resonant system. The value of this capacity appears to be sensibly constant under all conditions, whereas the value of the resistance is dependent upon the value of the tuning inductance. The effects due to reaction can be expressed in terms of the known theoretical conditions.

In Section III distortion in audio-frequency amplifiers is considered and the following conclusions are drawn, remembering, however, that they are provisional only; considerably more experimental work is necessary to confirm the general conclusions so far obtained.

(i) The effect of *increasing output* is to modify the wave-form seriously. In general, the harmonics increase in magnitude far more rapidly than the fundamental.

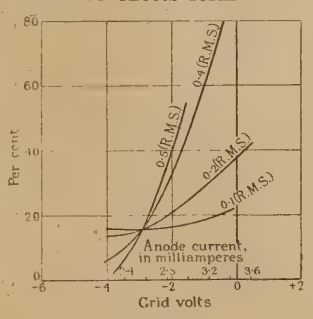

Fig. 5.

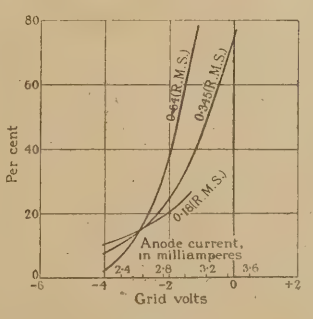

Fig. 6.

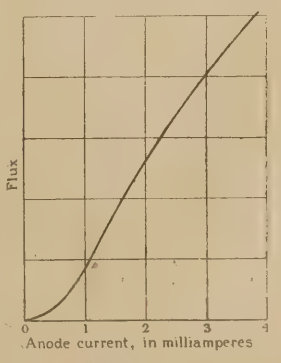

Fig. 7.

(ii) As the *frequency* is lowered, the distortion becomes much more serious. It is safe to say that at 150 p.p.s., the fundamental may be almost completely eclipsed by the harmonics with outputs of about 1 mA.

(iii) The effect of *negative grid bias* is to reduce the magnitude of the second and third harmonics and to introduce small harmonics of a higher order.

(iv) The *form factor* remains sensibly constant under most conditions.

(v) That the rapid growth of the higher harmonics (the fourth, fifth, and sixth) produces a critical distortion was noticed in many cases. The shape of the Lissajous figure quite appreciably changes with a very small increment of current beyond a given critical value. The form factor and other ratios are seriously upset in this case, and do not fall into the final inferences with smaller outputs.

(vi) In fig. 4 the percentages of the second and third harmonics are given for various outputs with different grid potentials; the rate of growth of the harmonics is much greater than that of the fundamental, thus demonstrating the rapid wave-form change as the amplitude of the sinusoidal input is increased.

(vii) In fig. 5 the ratio of the actual peak to the fundamental component peak is plotted for various output currents and

mean grid potentials and is expressed as a percentage greater than unity; the curves all intersect at a point corresponding to a mean negative grid potential of 2.9 volts. This means that the wave-form is *not altered* by increasing the magnitude of the output, and this condition is valid only at this point. Further, there is *definite distortion* leading to an error of 18 per cent. *which apparently cannot be removed by reducing the signal amplitude.*

(viii) The ratio of the actual peak value to the peak of a sine wave of the same r.m.s. value is plotted in fig. 6, from which a precisely similar result is obtained at the same mean grid-voltage condition. It seems probable that this condition is one defined by the normal d.c. anode-current component in the primary of the transformer, rather than any loading effect on the secondary, due to grid-filament impedance, which will be very large in all the cases considered. This grid voltage corresponds to 2.6 mA primary current. In Section I it is shown that the transformer voltage ratio is materially affected by the normal d.c. anode current, thus supporting this opinion. The shape of the *B-H* curve for the transformer is shown in fig. 7, from which it will be seen that the polarising flux brings the normal working point just at the beginning of the saturation bend. It is not easy, however, to observe any definite properties at this point.

It is apparent that the error between an r.m.s. determination of output and a fundamental wave determination as given by a resonant instrument may be often as much as 20 per cent. Further, the grid variation is much in excess of the theoretical as given by an r.m.s. measurement.

The general observations point to peak values giving the chief measure of output sound effect upon the human ear, and if this can be established it is clear that much modification will be necessary in our measurements of signal intensity.

Mining in other Countries.

Electric Power Plant in the Tropics and in South America.

(*Abstract of Paper read before the* ASSOCIATION OF MINING ELECTRICAL ENGINEERS.)

AT a recent meeting of the London branch of the above-named Association, Mr. H. M. Morgan described electric power plant at a group of collieries in the tropics, and also that at a group of metalliferous mines in South America, where the conditions are very different.

Tropical Collieries.—Steam, superheated to a total temperature of 500 deg. F., is generated by Lancashire and Babcock and Wilcox boilers; the latter are provided with Green economisers, chain grate stokers, and balanced draught. The large grates enable inferior fuel to be burned and, so far as is possible, the boilers are fed with condensate, and the make-up pit water has to be treated. As native labour is used it is advisable to render the plant as fool-proof as possible.

The generating station commenced in 1909 with one Belliss-Vickers set; two others were added later, and condensing plant has since been installed. The fourth set is a 500-kW, 2,200-volt, Belliss-G.E.C. condensing machine with a directly-coupled exciter, all the engines being capable of producing their full output at a reduced steam pressure—a useful feature for remote plant. The load is now normally carried by a Parsons reaction, 6,000-r.p.m., turbine driving a Mather and Platt, 1,430-kVA (at 0.7 p.f.), 2,200-volt, 25-cycle alternator at 750 r.p.m. through single-reduction cut gear, the exciter being directly coupled.

All the auxiliary plant is motor driven and the condenser air (steam) ejector has an intermediate condenser. The results in cheaper power production have been most marked, but at tropical collieries high atmospheric temperatures and a definite heavy rainy season have to be contended with. The condenser cooling water temperature has been as high as 98 deg. F., while that of the water pumped from the colliery workings has reached 94 deg. F. In the wet season with a dry bulb temperature of 84 deg. and the wet bulb thermometer at 81 deg., it is impossible to cool satisfactorily; Korting spray nozzles are used for water cooling purposes.

The cost of power, including labour, coal (a poor quality, picked out and charged at the average cost price of the whole output), stores and depreciation, is about 1¼d. per kWh for the non-condensing Belliss sets, say, at 350 kW; ¾d. per kWh for the condensing Belliss set, say, at 450 kW; and ½d. per kWh for the turbo-generator, say, at 800 kW.

The slate switchboard is by Erskine, Heap & Co., Ltd., whilst power transmission is by overhead lines at 2,200 volts throughout. Lightning arresters and choke coils are placed at every overhead bare transmission line end, of the horn and multigap types; in all cases there is a resistance in the earth circuit. The multigap type is preferred, but the arresters have not given full protection. At rare intervals there has been some damage to switchgear and joint boxes.

The poles are tubular or are rails; those for the 0.6 sq. in. (19/0.202 wires) line are 32 ft. long, 10½ in. diameter, reducing in two steps to 8¼ in. at the top. One conductor is carried on the pole top and two on a cross arm, giving 2 ft. 6 in. centres between conductors. The span is 270 ft. and the sag is about 9 ft., so that with the poles planted 5 ft. the minimum height of line above ground at centre of span is about 17 ft. The conductor weighs 2.4 lb. per foot. At bends towers are used made up of four poles well braced, and the terminal towers are also made up of four poles, but stronger than the angle towers. Disk strain and pin type insulators are used.

The end and angle towers are good for stresses of 12,000 lb. due to conductors. Single poles are good for a load of 2,240 lb. downwards and 1,100 lb. sideways at 2 ft. from the top. The disk strain insulators were subjected to a test pull of 12,000 lb. The pin type insulators were designed for a 1,000 lb. side pull applied at the conductor groove.

The type of cable most widely used is paper insulated, lead sheathed and double wire armoured. Formerly bitumen in various forms was used; it was all right at 440 volts, but gave trouble at 2,200 volts, and is not now used. In shafts the cables are rubber insulated and armoured. Junction boxes are usually of the "disconnecting link" type with glands arranged with a mechanical lead sheath seal, so avoiding wiped lead joints.

Electricity is supplied at 2,200 volts to the motors or to transformers which give a medium pressure of 440 volts for motors below 50 b.h.p. Transformers are of the core type, oil cooled, and vary in size for motors from 20 to 100 kVA and for lighting from 1½ (single phase) to 15 kVA (Scott connected).

The control gear for motors is of "mining" type, the equipment including voltmeter and ammeter, three-pole oil-break switch with two overload trips and one low-voltage release. Tank lowering gear is fitted which isolates the switch. The starting gear for motors is usually a liquid Sandycroft type interlocked in the case of haulage motors with an oil-break reversing switch for stator currents. The motors are commonly of the enclosed pipe-ventilated type with a temperature rise not exceeding 55 deg. F. on full load and with insulation chiefly of mica for withstanding a moist hot atmosphere. Motors for pumps and endless haulages are rated continuously and have brush-lifting and short-circuiting gear. Motors for intermittent haulage are one-hour rated and have extra heavy sliprings and brushes for continuous use. Recent motors have ball and roller bearings and means are provided for testing the air gap.

South American Mines.—The South American plant that is dealt with provides power for hoisting, pumping and milling at a group of metalliferous mines at a great elevation (from 12,000 to 14,000 ft. above sea level) in dry bare mountainous country where low temperatures are the rule. Fortunately a railway now reaches the area, so that heavy weights can be transported, though this was not always so.

The most convenient source of power is oil, and Diesel engines are the best prime movers. Beginning with two engines, the station now has four duplicate Diesel engines of the English Electric Co.'s make. Each has four cylinders and drives at 214 r.p.m. a 28-pole, 150-kW Peebles generator, three-phase, 660 volts, 50 cycles; neutral not earthed.

The b.h.p. of each engine is 326 at sea level, but only about 210 at 12,800 ft. above sea level, where the barometer reads about 19 in. Hg. and water boils at 190 deg. F. If the engines could be supplied with air at sea level pressure (say, 15 lb. per sq. in. absolute) they would give their sea level output, but when this plant was investigated it was found that of the 116 extra h.p. that the engine would give, 55 h.p. would be used in compressing the inlet air, leaving 61 h.p. as the gain. The cost of the compressor would be high and the money would be better laid out in purchasing a larger Diesel engine.

The thermal efficiency is reduced for the complete engine by having to drive the compressor for injection air, but, even so, the overall thermal efficiency is 34 per cent. The mechanical efficiency is about 72 per cent.

The distribution is extensive, and at various pressures: 660, 2,200, 6,600 and 11,000 volts. The overhead bare copper lines are carried on light steel tubular poles spaced about 40 metres apart and arranged for a minimum height of wire of 16 ft. above ground line. The wires are 16 in. apart for 2,200 volts; 16 in. apart for 6,600 volts; and 30 in. apart for 11,000 volts. An earth wire is carried on the pole tops and the conductors are supported on insulators on single brackets bolted to the poles.

Lightning storms are severe, and arresters of the oxide film type (General Electric Co., of America) have been called for recently, but not yet tried. As additional protection there is the earth wire, choke coils and a short length of cable between overhead line and transformers, whilst the end turns

of the transformers are specially reinforced as to insulation (Johnson & Phillips' standard practice).

The motors are for 600 volts, of the slip-ring and squirrel cage types mostly enclosed pipe-ventilated.

An interesting item of plant is a three-throw vertical sinking pump for 400 g.p.m., 300 ft. high (rams 9½ in. by 11 in. stroke at 50 r.p.m.). The motor is enclosed pipe-ventilated and drip-proof, of the squirrel-cage type, started by an auto-transformer which is mounted on the pump frame. The motor runs at 720 r.p.m. and is of 50 b.h.p.; between it and the pinion is a centrifugal clutch so that the motor starts light and gets hold of its load on attaining speed. The first pair of gears are laminated to minimise backlash. The pump is by Frank Pearn, and the motor by the Lancashire Dynamo and Motor Co.

Discussion in London.

The branch president, Mr. J. W. GIBSON, said he had had experience of some of the peculiarities of the Indian coal referred to, with a 26 per cent. ash content. He believed there had been cases in which this coal had been powdered and fired as powdered fuel successfully. Could that coal be used successfully in Lancashire boilers without forced draught? The description of the three-throw pump was very interesting; he, himself, was handling a similar problem, and would be glad of information with regard to laminated gears.

Mr. A. C. SPARKS said the most startling thing in the paper was the 2,200-volt overhead transmission line, which was the largest he had ever heard of. In some of the big lines in this country there was only two-thirds the dead weight of copper that there was in the line referred to in the paper. The tension of the wires was low, and he asked if difficulty had been caused by the phases blowing together. Again, there appeared to be no switches installed in the line.

Mr. W. F. BISHOP said he had never come across an overhead transmission line with a conductor of the size mentioned by the author. Had the author experienced any trouble with the cable, due to the acidity of the water in the pits? He believed that considerable trouble had been experienced in that connection in some of the Mysore fields, and special precautions had to be taken to overcome the difficulty. Apparently, however, the author had rubber-insulated cables.

Mr. H. M. MORGAN, replying, said he would not like the impression to go out that 26 per cent. was the usual ash content of Indian coal. That was the worst that had been found, and his analysis had shown the ash content to be 12 per cent; the coal was very free burning, and did not clinker at the ordinary temperature of the Lancashire furnace, but it would clinker in a Babcock & Wilcox furnace because the temperature there was higher. It was a very favourite coal; in Bombay it was dear, and for that reason it was used only as a "sweetener" for some of the other coals. Powdered fuel plant had been installed at the Mint, Hyderabad, but for some reason it was not a success there. With Babcock chain grates, one could use the worst coal one had got in the sizes which the grates would take, which were generally down to about 1½ in., and there was no need to pulverise. It cost about 2s. or 3s. per ton to pulverise, and why should he do it if it were unnecessary? He had pulverised some Indian coal and had made a short test with it, which was successful, but the test was not long enough to enable a conclusive decision to be arrived at. Lancashire boilers could be run without forced draught; most Lancashire boiler plant had 70- or 80-ft. chimneys, which would give all the draught needed to burn the coal successfully.

The dead weight on the transmission line poles, referred to by Mr. Sparks was within the weight for which the poles were designed, and there was a margin of safety. Regarding the phases blowing together, he agreed that the tension of the big cable was small; there were 90-yard spans, and a sag of 9 ft., which looked quite a lot, and the people concerned were rather afraid of the phases blowing together, but the line had experienced one stormy period without that occurring. There were tornadoes and cyclonic winds blowing in all directions, and the three wires might blow together, but he would expect all three wires to swing in the same direction at the same time and so keep apart; at any rate, they were heavy, and would have to cover a good arc before they would come together. If there were signs of trouble in that connection, it could be overcome by placing insulated spacers between the wires in the centre of each span. If transformers had been provided for that line it would have been a much better job, of course; it would have been cheaper, and there would have been better regulation and protection. All the feeder panels were equipped with a three-phase switch, with overload trips, but the slide was not sufficiently detailed to show them. He had not had trouble with the cables through acidity in the workings, chiefly because the cables could be kept dry. There was not very much trouble with ice, because the rainfall was small, and, although the temperature was low, there was a fairly strong sun. There were very strong wind storms and lightning storms, but there had been no trouble with the transmission lines, which were very small.

A High-pressure Cable Testing Outfit.

Messrs. Watson & Sons' Valve Rectification Apparatus.

THE experience gained in the manufacture of electro-medical and X-ray apparatus, which frequently employs very high voltages, has enabled Messrs. Watson & Sons (Electro-Medical), Ltd., to produce equipment for high-pressure cable and overhead line testing by means of hot-cathode valve rectification of h.p. alternating current. Although embodying a principle that has hitherto not been taken advantage of for this purpose, the plant seems to have passed the experimental stage, for it is claimed that such outfits have been satisfactorily used by municipal authorities, and one of the leading cable manufacturers.

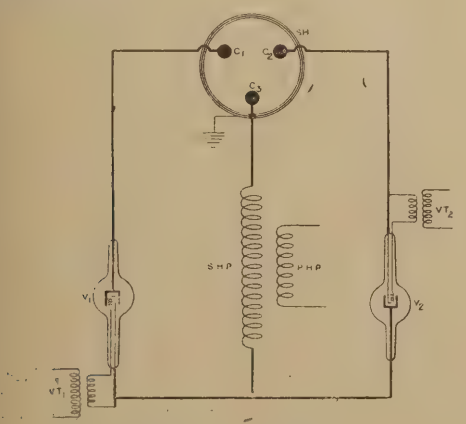

Fig. 1.—Diagram of Connections.

The principle upon which the hot-cathode valve depends for its operation is the fact that the highly evacuated space within a glass bulb containing two metal electrodes, one of which is made incandescent while the other remains comparatively cool, possesses uni-directional conductivity, so that current will pass through the valve only when the heated electrode is negative. The amount of current which can be rectified by such a device increases with the temperature of the heated electrode, but remains constant so long as the temperature of the latter remains constant.

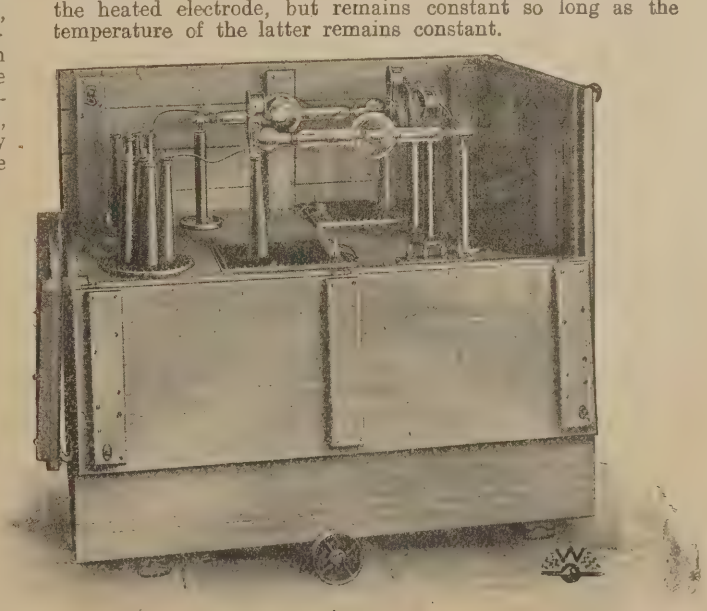

Fig. 2.—Control Cabinet and Rectifying Valves.

The essential parts of the one-ton testing outfit illustrated herewith are (*a*) the main h.p. step-up transformer, which weighs approximately 13 cwt., its overall dimensions being 51 by 30 by 63 in., and it is capable of a continuous output of 5 kVA at a secondary pressure of 75 kV r.m.s. (either terminal to earth) when connected with an a.c.

supply main or petrol-electric generating plant; and (*b*) two valve rectifiers with tungsten wire cathode filaments, two small transformers to furnish the heating current for the filaments, and means for controlling the voltage output of the plant, all of which is contained in the cabinet shown in fig. 2, which weighs approximately 7 cwt. and measures 41 by 63 by 57 in. Fig. 3 is an end view of the cabinet; the control gear proper comprises a 1-75-kW auto-transformer, a choke coil for intermediate adjustment, various meters, resistances, and an electrostatic 0-150-kV voltmeter in a

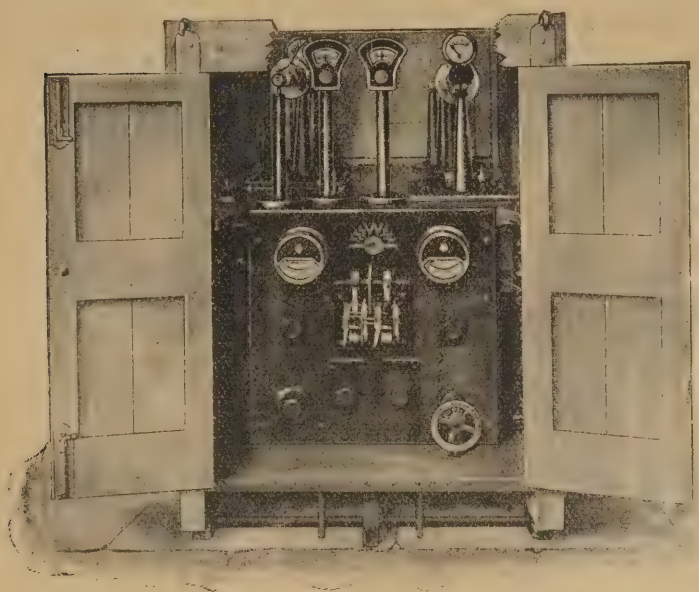

Fig. 3.—Control Cabinet ; end view.

separate carrying case. Direct current for testing is obtained by the rectification (by means of the valves) of the a.c. delivered by the main transformer and the utilisation of the capacity of the cable itself under test.

The diagram (fig. 1) indicates the method of connecting up the equipment; up to 150,000 volts may be applied between two cores and 75,000 volts between one core and earth. It will be seen that one end of the h.p. secondary winding of the transformer SHP is connected to the sheath SH of the cable, whilst the other end is connected to the anode of one of the valves and to the cathode of the other V_1, V_2. The cathode of the first valve is connected to one core of the cable, and the anode of the second to the other core C_1 C_2. The filament-heating transformers are marked VT_1 and VT_2.

When in operation, one-half of the sine wave from the transformer flows through the first valve and charges one core to a potential to earth equal to $\sqrt{2}v$, where v is the potential produced by the transformer. The second half of the wave flows through the other valve and also charges the second core to a potential to earth equal to $\sqrt{2}v$. Thus, between cores, there is a p.d. equal to $2\sqrt{2}v$, and at the same time there is a p.d. between cores and earth equal to $\sqrt{2}v$; usually the core not under test is connected to earth (C_3, fig. 1). These values are theoretically correct, but in practice, owing to leakage in the cable, which is, of course, a variable factor, the test voltage attained being usually a few per cent. below the value $2\sqrt{2}v$.

The method of connection to test one core at high voltage (up to 100,000 V) to earth is similar, except that C_2 and the sheath are earthed instead of C_3. With this method of connection it is possible to test one core to earth at a potential equal to $2\sqrt{2}v$, in which case use is made of one of the cores of the cable as a floating condenser, and the potential to earth on this core during test will be $\sqrt{2}v$. It will be noted that the anode of V_1 is connected to C_1—the core under test, one end of the h.p. winding SHP is connected to the cathode of V_1 and the anode of V_2, whilst the other end of the winding is connected to the "floating" capacity C_3; the cathode of V_2 is connected to the sheath of the cable.

Besides the 2-valve outfit referred to above, a single-valve model is obtainable capable of producing a test voltage up to 60,000 V between cores or from one core to earth. It is realised that apparatus of this kind is not an everyday commodity; only large commercial concerns or public authorities are likely to require it and, therefore, anything in the nature of mass production is not only undesirable, but quite impossible. Moreover, the circumstances in which the apparatus is to be used usually call for certain modifications. The above particulars must, therefore, not be regarded as a hard and fast specification, for we understand that the manufacturers are prepared to modify the equipment in any direction to suit the requirements of the user, and that they will be pleased to advise intending purchasers with regard to the manner in which adjustments may be made to render the apparatus most suitable for their purpose.

Selected Radio-Telephone Apparatus.

Recent Developments and Improvements.

"Lotus" Coil Holders.

We have received samples of the two- and three-way coil holders which are made by Messrs. Garnett, Whiteley & Co., Ltd., for outside panel and inside baseboard mounting. The moving block system comprises three sets of machine-cut gears that reduce the speed eight times. The gearing is hidden in the base under metal disks, all metal parts being nickel

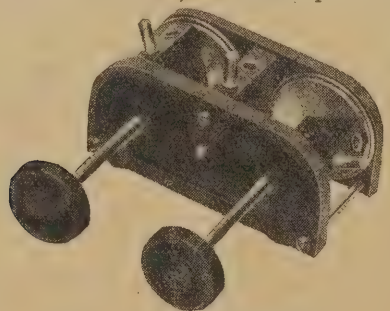

Fig. 1.—"Lotus" Coil Holder.

plated, while the side plates, coil holders, and handle knobs are Bakelite mouldings. The dimensions of these holders are about 2¾ by 2¼ in., while the depth, including the extension arms and knobs, is 4½ in. Fig. 1 illustrates one of the holders, the samples of which that were sent us being well made and enabling smooth and fine adjustment to be carried out.

Interesting Hospital Installations.

That broadcast radio entertainment is a boon to hospital patients is clearly demonstrated by the large number of institutions that have been equipped for the purpose. In most cases a multi-valve receiving outfit is employed with central control, in contrast to which practice an interesting installation has recently been completed in the Birmingham General Hospital. It consists of 45 B.T.-H. "Bijou" crystal receivers and 200 pairs of headphones. Four receivers are fitted in each ward, and six pairs of headphones are taken from each set, a connection being brought to each bed; indoor aerials are employed. This decentralised control system has proved very successful in practice: Since only six beds are connected to a particular instrument, that is the maximum number that would be affected by a temporary defect, and the possibility of defects arising in a crystal set are, of course, very remote, while it is possible to maintain a continuous service without any running cost whatsoever. The cost of the installation was very generously borne by the public in response to an appeal by the *Birmingham Gazette*, and the work was carried out by Messrs. Beresford Brothers, Birmingham, under the direction of the British Thomson-Houston Co., Ltd.

The Lincoln County Hospital installation was carried out on very serviceable lines by the Lincoln Wireless Co., Ltd. It is composed of a Marconiphone long-range V.2 receiver, with two amplifiers (voice and power types), which feed 126 'phone and 10 loud-speaker points, which are fed through specially designed "Ideal" line transformers. Another feature is the fact that the loud-speaker points also possess what is described as a unique form of compensating gear, whereby the balance of reproduction is not upset should the arrangement, or number, of loud speakers be varied from time to time. Three loud speakers of the "Mellovox" type have been supplied, and the 126 'phone points have been fitted with Sterling "Lightweight" headphones.

A Constructor's "Super-Het" Set.

There has been recently placed on the market by the General Electric Co., Ltd., a group of components which will enable anyone to construct a long-range selective "super-het." The group comprises the following:—Three intermediate-frequency transformers; filter; filter-tuning condenser; oscillator and terminal board covering approximately 200-600 metres; the full-sized blue print, which can be used as a template for marking off both the front and the rear of the panel, and the detailed book of instructions should enable even the most inexperienced constructor to build a first-class 6-valve receiver. Those who de-

aire to embody "Gecophone" components additional to the group mentioned will find them all suitable for mounting on ¼-in. to ⅜-in. panels, and it is suggested that the most suitable valves to use with such a set are Osram D.E.3, which have a filament current of 0.06 amp.

The "Siftron."

The current output of a receiving set or amplifier comprises two components. One is uni-directional and upon it is imposed the second component, which is alternating in character, providing the means whereby the diaphragm of the loud-speaker is caused to vibrate and emit sound. The continuous component serves no useful purpose in reproduction and its exclusion from the telephonic windings would be advantageous, because the pole pieces that influence the diaphragm are already polarised by permanent magnets and any additional constant force tends only to unduly stress the diaphragm. For a loud-

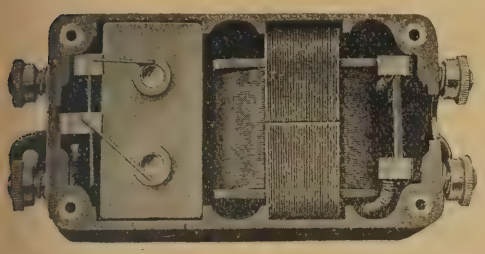

Fig. 2.—The "Siftron."

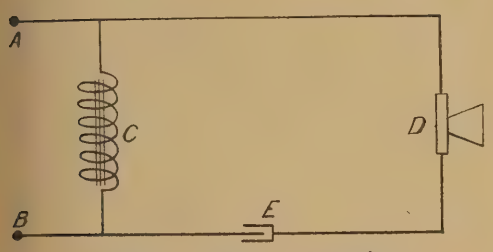

Fig. 3.—Diagram of Connections.

speaker that has its armature, reed, or diaphragm "balanced" by the application of initial magnetic effort, further energisation is not merely superfluous, but actually prejudicial, for the pole pieces will become supersaturated and the a.c. component will not vary the magnetic field to the same extent as would be the case were the direct component eliminated. The desired end may be attained by the use of the simple device shown in fig. 2 with its top cover removed. It is a product of Messrs. Alfred Graham & Co., comprising inductance and capacity housed in a Bakelite casing, and weighs 1¼ lb., its dimensions being 5 in. over terminals by 2¼ in. by 2¾ in. In fig. 3 A and B represent the output terminals of a receiving set or amplifier; these leads are bridged by an inductance C—a coil of relatively high impedance offering comparatively small resistance to the flow of direct current, but obstructive to alternating current. Across this impedance there are connected the windings of the loud speaker D in series with a condenser E of appropriate capacity, which is virtually an open path to a.c., but presents a closed door to the flow of d.c. Therefore the continuous current component flows through C, which constitutes a by-pass as it were, and the variable component through the coils of the loud speaker D *via* E. Thus the loud speaker input is in the form of modulated current only, and the instrument is enabled to function with the best effect. Such an arrangement is a sifter or filter circuit which, incidentally, offers the further advantage that it is unnecessary to join-up the loud speaker in any particular sense or direction. The values of the components have been accurately determined, and the "Siftron" is interposed between a receiving set and the loud speaker without altering any internal connections.

The Measurement of Coal.—In a paper read before the Manchester branch of the Institution of Civil Engineers, Mr. J. E. Lea, B.Sc., M.I.Mech.E., dealt with the question of the measurement by flow of solids, particularly coal. He showed that however much any mineral material might be broken or pounded up, its "homogeneousness" persisted, and, within fairly close limits, the weight per cubic foot of such broken and mixed up loose material did not vary very much under ordinary conditions. Also that for graded coals of any size, equal volume actually meant equal weight; a cu. ft. of ordinary mixed coal or slack, under ordinary conditions, did not weigh much more, if anything at all, than a cubic foot of graded nuts or peas. Mr. Lea also claimed that a given weight of actual coal occupied the same space whether wet or dry. Measurement by volume, he said, entirely ignored either the presence or absence of moisture, and therefore in many cases it was a truer measure of the actual coal than measurement by weight.

A Double-Bogie Electric Locomotive.

A Combined Battery and Trolley "English Electric" Shunting Engine.

FOR several years past the Castner-Kellner Alkali Co., Ltd., has been employing a combined battery-driven and overhead trolley collector locomotive for shunting duty about its Runcorn works, and so satisfactory did it prove to be that another was ordered from the English Electric Co., Ltd. The new locomotive recently commenced service and is illustrated in fig. 1, fig. 2 being an interior view of the driver's cab.

A part of the works' track, including a gradient and curve, is equipped with an overhead trolley line, the locomotives being driven by their batteries on the other parts of the track. The overhead line consists of a positive feed and a negative return wire, the voltage between the two wires being 190 volts d.c. Current is collected from the wires by means of two pantographs placed side by side on the roof of the locomotive and operated by compressed air.

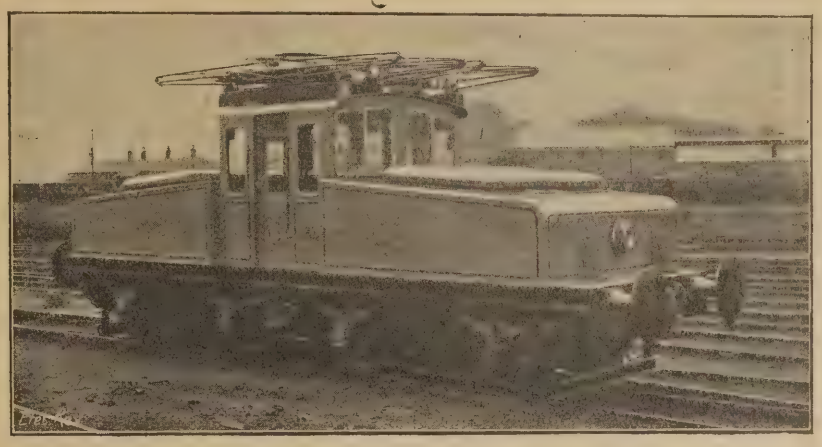

Fig. 1.—A Battery-Trolley Electric Shunting Locomotive.

The "N.I.F.E." battery on the locomotive was manufactured by Batteries, Ltd., Redditch, and consists of 146 cells of the nickel-iron type, having a capacity of 650 ampere-hours at the four-hour rate of discharge. The battery is carried in two halves in compartments in front of and behind the cab. Each half battery is in two iron crates fitted with lifting eyes so that it can be lifted bodily from the locomotive for repairs.

The locomotive is of the unarticulated, four-axle, double-bogie type; the cab is central and has large windows to pro-

Fig. 2.—Interior of Driver's Cab.

vide ample vision for the driver. Each axle is driven by a 42-h.p. series railway motor through spur gearing running in oil. The four motors are of the 200-volt DK 75C self-ventilating type. Two drum, series-parallel, controllers are fitted in the cab, one for each direction of travel, and all controls are duplicated so that the driver can control the locomotive from either driving position. The change-over-switch has three positions (trolley, battery, and charge), and is fitted in the cab, interlocks making it impossible to move this switch when

the locomotive is in motion. In the same way, the main controllers are locked when the battery is being charged.

The Westinghouse motor and air-compressor are mounted in the cab and the compressed-air cylinders are fitted at the ends of the battery compartments. The two air-operated pantographs are controlled by a valve placed beside the Westinghouse brake control; straight air and hand-operated screw pattern brakes are provided.

The voltmeter, ammeter, and ampere-hour meter are mounted on a panel between the windows, as are also the switches controlling the head, tail, and instrument lights.

All eight wheels are sanded by means of Westinghouse ejector valves and sand boxes placed on each bogie, the operation being controlled by foot-operated air valves placed beside the controllers at both driving positions and making sanding possible in both directions of travel.

The leading particulars are as follows:—

Type	0-4-40
Track gauge	4 ft. 8½ in.
Total adhesive weight	38 tons
Weight per driving axle	9.5 tons
Diameter of wheels	36 in.
Length over buffers	30 ft. 10 in.

Tractive effort on tread of wheels:—

(*a*) Continuous	10,000 lb.
(*b*) One hour	16,000 lb.
(*c*) Maximum	20,000 lb.

The Tungstone Accumulator.

A Cell with Machine-made Parts.

A NEW lead storage cell has been placed on the market by the TUNGSTONE ACCUMULATOR CO., LTD., for which many advantages are claimed. It is put forward especially for use on motor-cars, for starting, lighting, and ignition; and for the high-pressure batteries of wireless sets. For the former purpose it is made in two standard sizes: 12-volt, 54 plates, weighing 89 lb. complete without acid, and 6-volt, 27 plates, weighing 48 lb., the capacity being 50 Ah at the 20-hour rate of discharge in both cases. For wireless sets a 60-volt battery weighing (without acid) 23 lb. and having a capacity of 3 Ah is made.

The essential feature of the new cell appears to be the adoption of mechanical processes as completely as possible in the manufacture of the plates and containers. The component parts are made by the Tungstone High-pressure Die-Casting

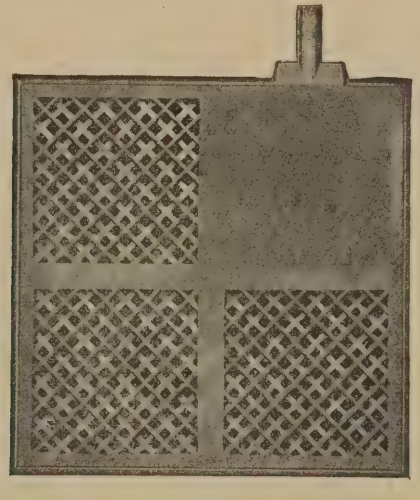

Fig. 1.—Four-section Tungstone Plate, one Section Pasted.

Co., with special automatic machines, and are of standard dimensions so as to be interchangeable. The basis of the design is a grid unit of pure lead, die-cast under high pressure, the present standard size being two inches square; the grid has evenly-spaced diagonal lattice ribs, with a strong frame, all of pure lead. These grids can be used singly, but for the larger cells are built up into plates by welding their frames together with antimonial lead; for this purpose semi-circular grooves are provided in the outside edges of the grids, so that when two grids are placed together a hollow channel of circular section is formed between them, into which molten antimonial lead is forced, permanently joining the grids. At the same time the groove round the periphery of the built-up plate is filled with antimonial lead, binding the whole together and providing increased conductance. It is claimed that this combination of pure lead for the active plate in contact with the paste, and antimonial acid-resisting lead for the supporting frame, is highly advantageous, increasing the life and efficiency of the cell.

The plates are pasted with pure lead oxides, with no inert admixture, in a patent pasting machine; the grids are totally immersed in the paste during this operation, and the paste is simultaneously fed under pressure to both sides of the grids, without exposure to the air, a process which, it is claimed, is entirely novel, and can be applied to any size of plate. Incidentally, the risk of lead poisoning is materially reduced by the extended use of machinery in the manufacture of the plates.

The patent Tungstone container is made of antimonial lead by die-casting in one piece, and is claimed to be immune from the infirmities that overtake containers of other materials, besides withstanding continued vibration. The lids are also die-cast with bosses to receive rubber pads, and vent plugs, in one piece.

The sections are built up of plates having lugs cast integral

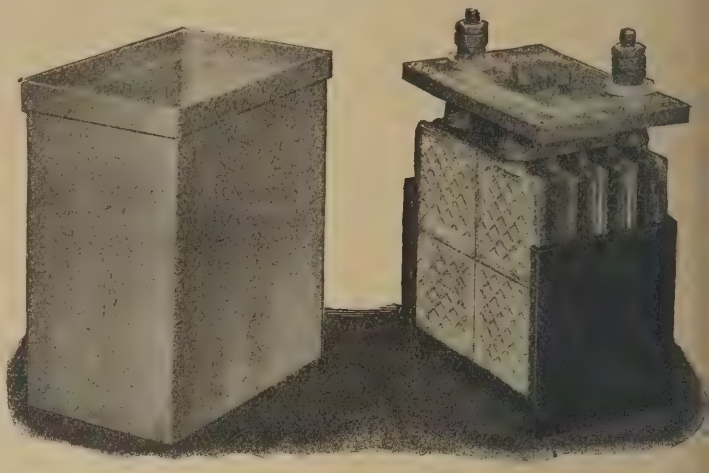

Fig. 2.—Container and Plates, with Lid and Ebonite Rests.

with the die-cast antimonial lead frames, the lugs passing through die-cast holes in bridge pieces; lead "burning" is not required, and any plate can be renewed without the use of heat. The bridge piece carries a strong terminal post, to which the coupling link is attached by a lead-coated Vislok nut. The sections are supported inside the container by a removable ebonite plate-rest and spacer at each end, grooved to receive the individual plates. There are no separators between the plates, and therefore the whole of the space is available for electrolyte, which is dilute sulphuric acid of sp. gr. 1,285, rising to 1,800 when fully charged. The lid fits snugly o a narrow ledge die-cast on the inside of the container, and can only be put on in the right way.

For use as car starting and lighting batteries, the cells are assembled in a wooden box with a sliding lid, fitted inside with rubber buffers; any complete cell or set of plates can be lifted out without disturbing the remainder.

The plates are formed at the makers' works and are given a partial first charge. The batteries are all sent out dry, and are filled with acid by the purchaser; after a rest of two hours they are charged at the full rate for five hours.

Fig. 3.—Standard 12-volt Car Battery.

The wireless cells each consist of a pair of plates two inches square in a glass container encircled with rubber bands, the containers standing on a rubber mat. An ebonite lid is sealed on the container, with an ebonite vent plug. The cells are coupled together with antimonial lead connectors, burnt on to the lugs, and provided with sockets for wander-plugs. Used on a 3-valve set, the 60-V battery is estimated to require fully re-charging about every six months; it is delivered dry and partially charged, and may be used without charging, two hours after filling with acid, but should be fully charged after a month's working.

Tungstone cells are all-British in design and manufacture.

Correspondence.

Correspondents should forward their communications **at the earliest possible moment.** *No letter can be published unless we have the writer's name and address in our possession.*

C.T.S. Trailing Cables.

We note a reference in your current issue, in a paper by Mr. I. Sclar, to accidents having occurred with cab-tire trailing cables with an earth wire incorporated in the cable, and he suggests that if the earth conductor had taken the form of an outside flexible metallic tube, such accidents would not have happened.

Mr. Sclar is evidently not aware of the fact that the present standard practice in trailing-cable design is to have a braid of tinned copper wires *surrounding* all live conductors, so that these can hardly be damaged without this earthed braiding cutting off current.

St. Helens Cable and Rubber Co., Ltd.

Slough, *January 1st*, 1926.

The Salaries of Combustion Engineers.

On reading the article on "The Combustion Engineer" in your issue of December 25th, my sympathy went out to Mr. C. F. Wade, who, a chartered engineer, has apparently always had the misfortune to meet engineers (?) who will persist in condemning turbine pumps and who will try to run their boilers in series; under such circumstances one can quite understand his nominating a "chemist with engineering inclinations" to such an exalted position. May I, however, point out that the chemistry of combustion engineering is very seldom the lot of the average chemist, but is it so very simple that any engineer may render himself quite conversant with it in a very short period? Combustion engineering is not simply a case of chemistry—to be a good combustion engineer one must first be an engineer; all the principles involved demand that such be the case—take the turbine pumps, for instance.

That there is much room for improvement is not disputed. Some time ago I spoke of a method that is daily gaining popularity; I was saved from annihilation at the hands of eminent engineers by Mr. D. Brownlie and Mr. Leonard Harvey. May I suggest that if engineers were allowed to have the necessary boiler-room instruments and if more notice were taken of their suggestions, the necessary improvement would be attained without adding to the staff a highly paid chemist of doubtful engineering ability. For the greater part engineers have to operate their plants with no other instruments than the gauge and water column. I am speaking as a shift engineer who, after a marine shop training on the Clyde, joined the power plant field in America. I have been right through the mill in a large American power plant, and in the process of becoming shift engineer in charge had to pass through as boiler-room superintendent and combustion engineer. In American practice the shift engineer is often termed "chief engineer," and in any case is in absolute charge of the station and the personnel thereof during his shift. It would be interesting to learn whether there are chemists at such stations as Dalmarnock or Barking to see that the shift engineer in charge does not attempt to put the boilers in series.

As I am an honours graduate and hold the diploma of America's largest college of combustion engineering, may I be permitted to sign myself

Another Combustion Engineer.

December 26th, 1925.

Whilst there is a certain amount of truth in some of Mr. C. F. Wade's statements, as set forth in his article on December 25th, it is equally obvious that a few of them ought not to go unchallenged.

To put the theme of the article into a nutshell is to infer that, in matters pertaining to combustion, the average charge engineer is a "dud," and his chief a bigger one for appointing him. Furthermore, he should command a lower salary than an engineer who has taken, say, Mr. Wade's full course on combustion. In addition, this student of combustion—or shall we say, expert?—is to be in sole charge of the steam generation, whilst the charge engineer will nominally be responsible for the whole plant.

On this showing I am afraid Mr. Wade's notions of power-station efficiency will not meet with universal approval among operating staffs, as such proposals would immediately cause discontent and thus lead to inefficient results. I assert that the charge engineer of to-day, who has had over 15 years' experience as a charge engineer, and has kept himself *au fait* with all necessary technical literature, will produce better combustion results than any other class of engineer, who has learnt all he knows about combustion from a 12 months' course by correspondence. In a 6,000-kW station not 20 miles from Sheffield, having a maximum load of 3,000 kW, the coal figures per unit generated are often below 2 lb. with a load factor of 20 per cent., and these figures are not obtained by any chemist, B.Sc., or combustion student, but by experienced charge engineers who have been at the game all their lives, and have gained their notions of combustion from everyday routine.

If Mr. Wade deplores the low salaries chiefs offer his students, he ought to remember the old adage—the market value of an article is just what it fetches.

Service in Emergency.

As a member of the Institutions of Mechanical and Electrical Engineers, I have received (although employed in the electricity supply industry) two similar inquiries as to what I would be prepared to do and where I would like to go in case of national emergency.

Surely the Institutions and/or the Government would be better employed, if continuity of electricity supply is their aim, in persuading (or possibly legally compelling) undertakings which are not at present parties to the National Joint Board for Electricity Supply and the National Joint Industrial Council to join these schemes, for it is doubtless more satisfactory to eliminate the possibility of a national emergency than to provide, or try to provide, for dealing with it when it arrives.

In the provinces, municipal undertakings and supply companies generally are sound-minded, but there are some, in the London area especially, which have ideas of their own, which in the opinion of the majority are not conducive to industrial peace, and with the advent of the super-station and the ambition of its owners to spread its tentacles far in all directions, to my mind the limitation of dividends and the control of tariffs are not more important than the question whether the undertakings concerned are prepared to abide by the decisions of properly constituted Whitley Councils with regard to the conditions of employment of the staff and manual workers.

A.M.I.E.E., A.M.I.Mech.E.

London, *January 4th*, 1926.

Overhead Distribution.

The intervention of the Christmas holidays prevented my answering Mr. S. E. Glendenning's letter of December 19th, last week. As I have no intention of continuing this correspondence, which can be of no general interest, I would simply say:—

1. The printing error certainly fogged the original statement somewhat.
2. I was under the impression that Mr. Glendenning's original complaint was mainly on account of the guard wires, where the line has had to cross the telephone wires owing to the difficulty in obtaining wayleaves. Now, apparently, the mangled trees are having his sympathy. I would suggest that he visit Brundall early in May, when he will probably find that the mangled trees only exist in his imagination.
3. An e.h.p. overhead line across country, keeping two fields off, is excellent in theory. I hope Mr. Glendenning will some time have the opportunity of planning such a line, and will personally deal with the wayleaves. Farmers would welcome lines of trees through their fields, I have no doubt (?).
4. The six-mile line from Norwich conveys current at 6,600 volts; convert this to 400 volts between phases, and there is every probability that it would have been placed overhead instead of underground, on account of cost.
5. I decline to split hairs on the question of interest on capital on the two systems, but as a member of the I.E.E. Mr. Glendenning can surely work out to his own satisfaction the actual cost of overhead *versus* underground, for any given set of conditions.

Finally, I hope that with the long-promised Government assistance for rural distribution schemes, there will be ample opportunity in the near future for both overhead and underground systems to be employed.

G. Redgment.

Norwich, *January 2nd*, 1926.

Assisted Wiring.

With reference to Mr. H. T. Young's letter in your issue of January 1st, may I point out that to find a name for a complaint does not contribute to the removal of its cause. Influenza is a case in point.

I am glad to see that Mr. Young and the contractors whom he knows are generally in favour of this development, and will co-operate with it. But there are others (Mr. Young admits that he knows one) who are not in favour of it, and others still who damn it with faint praise and hypothetical objections.

Mr. Young asks who has been chiefly responsible for developing the installation side of the industry in the last thirty years. I would rather ask who, or what, has been responsible for the disastrous fact that it has *not* developed to anything like the extent it should, and that even otherwise backward countries are far ahead of us in the domestic use of electricity.

I have no experience of conditions in the United States. It may be that the American wiring contractor, like the American workman, has different ideas from ours as to the amount of work he ought to do.

I do not follow Mr. Young's remarks as to gas showrooms. Does Mr. Young really think that there are none, or that, if there are, they are not visited? I write in a London suburb, and within a 1d. 'bus ride of where I sit there are three really

palatial gas showrooms. A postcard or a telephone call to any of them will bring a representative ready to quote very low rates for any gas installation required. Of course our commodity is immeasurably superior to theirs in many respects, but do not let us delude ourselves into thinking that they do not know how to sell it, or that they make the mistake of over-charging for the consuming devices because they have no installation contractors to compete with them. The truth is that their policy is just the opposite.

The great British public cares nothing about a monopoly of it gives good service.

My *nom-de-plume* provides its own explanation and justification, and I again sign myself unrepentantly,

A Manufacturer's Salesman.

January 2nd, 1926.

X-ray Apparatus.

Our attention has been drawn to certain remarks made by the chairman of the General Committee of the Coventry and Warwickshire Hospital with regard to X-ray apparatus.

According to the *Birmingham Post*, this gentleman is reported to have stated that British X-ray couches are heavier, more difficult to manipulate, and just about three times as expensive as the German models.

The chairman did not apparently vouchsafe the simple explanation of this disquieting fact, *viz.*, that British radiologists demand a degree of "protection" for the operator against the harmful effect of the rays which is considered to be quite unnecessary in Germany. The X-Ray Protection Committee has accordingly drafted a series of recommendations with which British manufacturers are usually asked to comply, and frequently to more than comply, but which the foreign maker can disregard.

If the apparatus to be supplied to the Coventry and Warwickshire Hospital is to be as well protected and as universal as the best British product, then it is *not* a fact that the latter is one whit more heavy or cumbersome, but if these considerations are disregarded the remarks of the chairman are not altogether incorrect. Even so, the cost of the very best British X-ray couch is not £270, or anything like it, and, quality for quality, British manufacturers have nothing whatever to bemoan; in fact, there are few industries that have held their own so well.

Newton & Wright, Ltd.
R. S. WRIGHT.

London, *December 29th*, 1925.

[This matter is referred to in our leading columns.—EDS. ELEC. REV.]

Trade-Mark Applications.

THE following are among the recent applications for British trade marks. Objections against any of the proposed marks may be entered within one month from December 30th, 1925. In the case of foreign applications, the names and addresses of the British representatives are also given:—

Marconite. No. 464,176. Class 1. Insulating varnishes.—Marconi's Wireless Telegraph Co., Ltd.

Hicycle (lettering and design). No. 462,945. Class 6. Portable electric machine tools and current generating machines for operating such tools.—Chicago Pneumatic Tool Co., New York. (W. Brookes & Son, 5, Chancery Lane, W.C.2.)

Mippophone. No. 453,067. Class 8. Instruments and apparatus for use in radio-telephony.—M. I. Vaughton, 88, Vyse Street, Birmingham.

Operadio. No. 463,632. Class 8. Radio receiving sets and parts thereof.—The Operadio Corporation, Chicago. (Boult, Wade & Tennant, 112, Hatton Garden, E.C.1.)

Silvotone. No. 563,967. Class 8. Instruments and apparatus for use in radio-telegraphy.—W. S. Life, 32, West Street, Southport.

Pipsopan. No. 463,973. Class 8. Radio receiving apparatus.—A. J. A. Archdale, 32, Dawson Crecent, Torquay.

Annulex. No. 463,948. Class 11. X-ray vacuum tubes for surgical or curative purposes.—C. Anderson, 47, Red Lion Street, High Holborn, W.C.1.

Ebonoid. No. 463,828. Class 50. Hard rubber goods of the nature of vulcanite or ebonite.—Clayton Rubber Co., Ltd.

Published Specifications.

Compiled expressly for this journal by Patent Agents.
The name of the applicant's patent agent, if any, will be found on the printed specification.
The numbers in parentheses are those under which the specifications will be printed and abridged, and all subsequent proceedings will be taken.

1924.

13,791. "Electric discharge devices, such as thermionic tubes and the like." Dr. E. F. Huth Ges. June 5th, 1923. (217,230.)

13,937. "Systems for the propagation and reception of Hertzian waves." L. Levy. June 6th, 1923. (217,245.)

14,130. "Electrical connectors." J. D'A. Clark. June 11th, 1924. (244,136.)

14,264. "Closed circuit electrical regenerative motor systems." W. P. Durtnall. June 12th, 1924. (244,137.)

14,459. "Wireless distant control apparatus." E. Fiamma. June 14th, 1924. (244,139.)

19,217. "Testing and measurement of audition." Standard Telephones and Cables, Ltd. (formerly Western Electric Co., Ltd.). (Western Electric Co., Inc.). August 13th, 1924. (244,147.)

20,993. "Electric discharge tubes." F. S. McCullough. April 3rd, 1924. (231,821.)

21,099. "Vibrating devices, particularly applicable to siphon recorders." Standard Telephones & Cables, Ltd. (formerly Western Electric Co., Ltd.). (Western Electric Co., Inc.). September 6th, 1924. (244,154.)

21,217. "Electric welding systems." British Thomson-Houston Co., Ltd. (General Electric Co.). September 8th, 1924. (244,155.)

21,370. "Method of transmitting speech by high-frequency waves." E. Habann. October 2nd, 1923. (222,848.)

21,379. "Sound-reproducing and amplifying apparatus, such as phonographs and loud-speaking apparatus for wireless telephony." G. G. De Andia-Yrarrazaval. September 10th, 1924. (244,162.)

21,398. "Sound boxes for electrical transmission for loud-speakers, telephones and the like." C. Lindstrom Akt.-Ges. July 26th, 1924. (237,544.)

21,411. "Process of, and apparatus for the electric transmission of images." A. Dauvillier. November 29th, 1923. (225,516.)

21,435. "Impulse transmitters for use in telephone or like systems." Automatic Telephone Manufacturing Co., Ltd. March 15th, 1924. (230,779.)

21,436. "Telephone systems." Automatic Telephone Manufacturing Co., Ltd. March 28th, 1924. (231,419.)

21,486. "Means and methods for electrodepositing nickel, cobalt, or nickel alloys." E. Potter (Madsenell Corporation). September 11th, 1924. (244,167.)

21,487. "Means and methods for electrodepositing nickel, cobalt, or nickel alloys." E. Potter (Madsenell Corporation). September 11th, 1924. (244,166.)

21,508. "Receiving apparatus for high-frequency signalling systems." N. P. Hinton and Metropolitan-Vickers Electrical Co., Ltd. September 11th, 1924. (244,169.)

21,509. "Telephone instruments." W. S. Stephenson and G. W. Walton. September 11th, 1924. (Cognate application, 14,815/25.) (244,170.)

21,510. "Multiple aerial for wireless signalling systems." C. Lorenz Akt.-Ges. September 11th, 1923. (221,818.)

21,591. "Magnet structures for telephone receivers and the like." W. J. Palmer. September 12th, 1924. (244,175.)

21,952. "Space discharge tube systems for the manipulation of high-frequency currents." Standard Telephones & Cables, Ltd. (formerly Western Electric Co., Ltd.). (Western Electric Co., Inc.). September 17th, 1924. (244,190.)

22,258. "Metal-enclosed electrical switchgear." Ferguson, Pailin, Ltd., S. Ferguson, and G. Pailin. September 20th, 1924. (244,193.)

22,419. "Electrical apparatus for the measurement of the level and flow of liquids and the height or movement of a body." G. F. Shotter. September 23rd, 1924. (244,195.)

22,429. "Thermionic valves." S. Hector. September 23rd, 1924. (244,196.)

22,859. "Frames or casings for panel boards for supporting wireless or other apparatus." W. Walker and Radio Communication Co., Ltd. September 27th, 1924. (244,200.)

22,964. "Crystal detectors for wireless apparatus." F. J. Rundle. September 29th, 1924. (244,201.)

23,107. "Automatic telephone instruments." Sterling Telephone & Electric Co., Ltd., R. H. Dougan, and J. R. Penney. September 30th, 1924. (244,202.)

23,772. "Loud speakers." A. H. Watkins. October 8th, 1924. (244,210.)

23,938. "Crystal rectifiers for radio reception." British Thomson-Houston Co., Ltd., and J. Hutt. October 9th, 1924. (Cognate application, 729/25.) (244,214.)

24,236. "Electrolytic rectifiers." A. B. Muntyan. October 19th, 1923. (223,561.)

25,371. "Wireless receiving apparatus." J. W. Combe. October 24th, 1924. (244,227.)

25,545. "Electrical operation of railway points and signals." L. H. Peter and Westinghouse Brake & Saxby Signal Co., Ltd. October 27th, 1924. (244,230.)

25,564. "Electrical condensers." Dubilier Condenser Co., Ltd. (formerly Dubilier Condenser Co. (1921), Ltd.). (W. Dubilier). October 27th, 1924. (244,231.)

26,053. "Alternating-current relays." L. H. Peter and Westinghouse Brake & Saxby Signal Co., Ltd. November 1st, 1924. (244,234.)

26,071. "Devices for use in connection with telephonic reception." W. M. Manning. November 1st, 1924. (244,237.)

26,648. "Variable electric condensers." J. R. Barnhart. April 9th, 1924. (232,166.)

26,951. "Metering of calls in telephone systems." Siemens Bros. & Co., Ltd., D. A. Christian and W. G. Patterson. November 11th, 1924. (Addition to 200,928.) (244,244.)

27,939. "Electrical switches." R. Woods. November 21st, 1924. (244,247.)

28,143. "Electric connection fitting." M. J. Railing and F. G. Quance. November 24th, 1924. (244,249.)

28,397. "Electro-magnetic inductance coil holders or mountings." E. Whiteley and Garnett, Whiteley & Co., Ltd. November 27th, 1924. (244,251.)

30,530. "Radio transmitting circuits." Telefunken Ges. für Drahtlose Telegraphie. December 22nd, 1923. (226,556.)

30,799. "Insulator structures for electrostatic condensers and the like." I. P. Rodman. March 8th, 1924. (230,417.)

1925.

389. "Selecting switches for use in telephone systems." Siemens and Halske Akt.-Ges. and K. Giese. January 6th, 1925. (244,281.)

949. "Grid leaks, anode resistances, and the like." M. Koopman. January 12th, 1925. (244,284.)

2,539. "Switches for electric water-heating apparatus." K. F. Henneman and P. Kerkhoven. December 1st, 1924. (Addition to 206,834.) (243,663.)

2,584. "Wireless receiving apparatus and condensers therefor." S. Williams and L. Williams. January 29th, 1925. (244,294.)

3,420. "Electric induction motors." British Thomson-Houston Co., Ltd. February 9th, 1924. (228,928.)

6,635. "Protective device for compensated asynchronous motors." Deutsche Werke Akt.-Ges. March 12th, 1924. (230,830.)

8,368. "Dynamometers." Dr. M. Kurrein. March 29th, 1924. (231,524.)

9,167. "Electric drive for machine tools, particularly planing machines." Siemens-Schuckertwerke Ges. April 7th, 1924. (231,904.)

10,950. "Pneumatic power transforming apparatus." H. Wade (Soc. d'Electricité et de Mécanique Procédés Thomson-Houston et Carels Soc. Anon.). April 27th, 1925. (244,330.)

11,688. "Alternating-current bell." M. B. Richter. August 5th, 1924. (238,188.)

13,464. "Production of oscillating currents by static transformers and the like." Telefunken Ges. für Drahtlose Telegraphie. May 23rd, 1924. (234,517.)

14,465. "Brush gear for dynamo-electric machines." Metropolitan-Vickers Electrical Co., Ltd. June 24th, 1924. (236,182.)

14,828. "Manufacture of electric lamps and similar electric devices." Naamlooze Vennootschap Philips' Gloeilampenfabrieken. June 7th, 1924. (235,229.)

14,875. "Adding or differential watt-meter relay." Measurement, Ltd. September 11th, 1924. (239,828.)

16,643. "Rectifiers for wireless reception." S. J. Eintracht and E. J. Dickins. June 29th, 1925. (244,348.)

16,871. "Incandescent cathode X-ray tubes." Naamlooze Vennootschap Philips' Gloeilampenfabrieken. November 20th, 1924. (Addition to 208,108.) (243,310.)

16,782. "X-ray tubes and installations for operating same." Naamlooze Vennootschap Philips' Gloeilampenfabrieken. March 25th, 1925. (244,3[illegible])

21,674. "Electrical gas purification." Lodge Cottrell, Ltd. (formerly Lodge Fume Co., Ltd.). (Metallbank und Metallurgische Ges.). August 29th, 1925. (Addition to 177,117, as modified by 238,480.) (244,372.)

23,234. "Telegraph signalling systems." Standard Telephones & Cables, Ltd. (formerly Western Electric Co., Ltd.). (Western Electric Co., Inc.). August 7th, 1924. (Divided application on 241,327.) (244,025.)

23,506. "Electric rectifiers." International General Electric Co. Inc. September 26th, 1924. (240,453.)

25,647. "Telephonic apparatus." V. A. Foot. September 6th, 1924. (Divided application on 243,102.) (244,384.)

The

Electrical Review

VOL. XCVIII. JANUARY 15, 1926. No. 2,512.

THE OLDEST ELECTRICAL PAPER. ESTABLISHED 1872.

Published every FRIDAY, Price 6d.

Chairman: H. ALABASTER.

Technical Editor: A. H. ALLEN, M.I.E.E. *Joint Managing Directors:* G. H. ALABASTER. E. A. GATEHOUSE, M.I.E.E. A.M.INST.C.E. *Commercial Editor:* A. H. BRIDGE.

Manager and Secretary: E. S. MIDDLETON.

OFFICE: 4, LUDGATE HILL, LONDON, E.C.4.

Telegraphic Address: "AGEEKAY, CENT., LONDON," Code, A B C. Telephone No.: Central 7072 (Three Lines).

The "Electrical Review" is the recognised medium of the Electrical Trades, and has by far the Largest Circulation of any Electrical Industrial Paper in Great Britain.

SUBSCRIPTION RATES, Postage Free: United Kingdom, £1 14s. 8d.; Canada, £1 12s. 6d.; Colonial and Foreign, £2 1s. 6d. per annum Cheques and Postal Orders (on Chief Office, London) to be made payable to THE ELECTRICAL REVIEW, LIMITED, and crossed "Midland Bank, Newgate Street Branch."

LIST OF FOREIGN AGENTS (see first page "Official Notices").

Hidden Dangers.

THE idea that electricity in some form or other may be applied to the body with beneficial results has possessed the layman ever since that mysterious agency has been available to his hand; and the temptation to apply such treatment to himself, without the advice of a medical man, has frequently been too powerful for him to resist—with fatal results in some cases. A notable instance of this tendency was the popularity of the "Harness belt" some 30 years ago, a device which was shown by this journal at the cost of a series of hard-fought libel actions to be electrically useless; the vendors of the belt had reaped a rich harvest from the simple folk who put their faith in the marvellous healing properties claimed for the belts, which professed to contain electric batteries of the "Voltaic pile" type, but were often not completely connected up to form an electric circuit, and in any case had no curative value at all, such benefits as the wearers experienced being due not to electricity, but to faith and flannel.

The Harness belt, however, was at least harmless, except to the pocket of the purchaser (though many poor wretches whose lives might have been saved by proper medical attention were deluded to their destruction by specious promises of betterment), the same cannot be said of some of the powerful and effective instruments that are now available to the public. That electricity in therapeutics has proved itself of immense value in a variety of ways is, of course, beyond question; but we wish to emphasise the fact that such treatment should never be undertaken except under competent medical supervision.

Experimenting with X-rays has entailed painful consequences to many an amateur, and apart from the danger of X-ray burns which may result in the loss of limbs and eventually of life, there are strong reasons for restricting the use of this very potent radiation to the hands of experts worthy of that trust. That a word of warning is not superfluous may be gathered from recent correspondence in the lay Press regarding the use

of X-rays in shoe shops, for the purpose of revealing to customers the disposition of the bones of their feet when correctly fitted with suitable footwear. The intention is good, but the operation is unnecessary; and though the makers claim that the apparatus is so designed as to safeguard against any harmful effects to either the customer or the operator, the fact remains that the element of danger is present, particularly to the latter, who is constantly exposed to the effect of any stray radiation that may occur. Such effects are cumulative, and may not be revealed for many years after the mischief has been done. Nor is it at all certain that all the dangers associated with X-rays have yet been identified.

In our last issue Dr. W. S. Hedley outlined the history of the use of X-rays in therapeutics, and described the elaborate precautions that had been adopted to guard against the dangers surrounding the X-ray tube—in spite of which from time to time we still have to record another martyrdom; and he gravely questioned whether every medical man who handled these rays in a professional capacity was fully conversant with their properties and their attendant risks. In his opinion no-one but a qualified man should apply the X-rays to the living body.

Again, according to the *Weekly Dispatch*, only last week a man who was in the habit of treating himself with "artificial sunlight" fell asleep in the act, and was exposed to the radiation, presumably containing ultra-violet rays, for an hour and a half; he woke up to find that his skin had peeled off, and has been seriously ill ever since the mishap. Many people treat themselves in this way, and are liable to similar consequences. It is indeed fortunate that radium is too expensive to become the plaything of hypochondriacs—its unsuspected capacity for burning the skin was the cause of some serious occurrences in the early days, when a man would innocently carry a tube containing it in his waistcoat pocket.

In another direction the uncontrolled use of electricity presents real risks: we refer to the electric toys which are now exposed for sale. Some of these are intended for connection to the lighting circuits, which are more often than not at a pressure of more than 200 volts. A lamp is to be inserted in series with the toy, but it should be realised that when the circuit is open, though there is no current, the full pressure is present up to the point of interruption. Moreover, the lamp may be replaced by some ingenious substitute which removes even that safeguard. In any event, the practice is altogether too dangerous, and it should be made a criminal offence to place such toys in the hands of children, who are thus exposed to the double risk of fire and fatal shock.

The Electrical Trade Section at Birmingham.

We are pleased to report that so great has been the measure of support promised in connection with the Birmingham Section of the British Industries Fair that a large extension to the permanent exhibition buildings at Castle Bromwich has been found necessary. The progress of the Electrical Trade Section, to which we have made frequent reference, is partly responsible for this, and in addition the general engineering trades of the country are participating on a much larger scale than on any previous occasion. The enlargement that has been decided upon is to take the form of an entirely new building on vacant ground between two existing buildings which are at present connected by two corridors. With these three buildings thrown together there will be one vast display hall with an area approximating to 100,000 sq. ft., a considerable part of which will be occupied by the Electrical Trade Section. This section is, as our readers know, the outcome of a conference held at the Birmingham Chamber of Commerce, and electrical companies and firms have come forward in very satisfactory numbers—taking considerable space for both trade and working exhibits. We gave a list of exhibitors last week, and this has to be supplemented by a number of others including, we understand, Messrs. Veritys, Ltd., the Hackbridge Electric Construction Co., Ltd., and Callender's Cable & Construction Co., Ltd. In addition to the trade exhibits there will be a worthy demonstration by the Birmingham Corporation Electric Supply Department, while there is also a permanent electricity supply transforming plant provided by that department in the exhibition buildings.

Every effort is being made to add to the practical electrical interest of the occasion (February 15th to 26th) by the organisation of a series of electrical conferences on subjects connected with electrical development, and invitations to be present at some of the functions have been issued to the associations representing the electrical manufacturers, the contractors, the wholesalers, municipal electrical engineers, consulting engineers, the cable-makers, the lamp manufacturers, also the electric power companies, the chief officials of the London electric supply companies, the Provincial Electric Supply Committee, and, of course, representatives of the I.E.E. The fact that Mr. Chattock, the president of the Institution of Electrical Engineers, is Chief of the Birmingham electricity undertaking, which is so closely interested in the Castle Bromwich Fair, is a very happy coincidence.

It will be gathered from the foregoing that all goes well with the arrangements for ensuring a successful electrical twelve days next month at Birmingham. By the date of the visit of the Duke of York, on or about February 18th, there will probably be a live electrical trade market in existence which large numbers of our readers would do well to enter in their diaries straight away.

French Power-station Practice.

In France, as elsewhere, power-station practice has developed in the direction of the use of larger generating sets. Steam pressures have gone up, but not to the same extent as in Germany. The American system of very large generating sets made up of two or three pressure-stage turbines on parallel shafts has not made headway, and the output of 3,000-rev. turbines has not been pushed as far as with us. The Ljungström turbine, which in medium sizes has proved to be a remarkably economical machine in this country, has not been used in France to any extent. In output, the largest stations are those of Gennevilliers and Saint Ouen, near Paris; the former is of 340,000-kW capacity, and the latter is being enlarged to the same output. Whilst Gennevilliers contains more innovations, perhaps St. Ouen would appeal more to British engineers.

We continue in this issue the description of a station at Comines, near Lille, the design for which was prepared after the Armistice. The layout is arranged for 25,000-kW generating sets, the steam pressure being approximately 300 lb. with 700 deg. F. total temperature. The generators, working at 10,500 volts, are coupled to single-phase transformers, which raise the voltage to 45,000, at which pressure the switching is done. Power is taken by overhead mains to the outskirts of Lille and Tourcoing and is carried finally to the main sub-stations by single-core cables. Among the interesting features may be mentioned the analysis and mixing of the coal from various collieries, the simple appliances for ash disposal, the adoption of two armoured concrete condensing pressure mains to avoid deep trenching in bad ground for the construction of open channels, the use of distilled water from quadruple-effect evaporators for boiler and transformer cooler make-up, the successful use of pulverised low-grade coal, and the simplicity of the switchgear. The station, as a whole, strikes one as being a well-thought-out engineering job, and a credit to those responsible for it. The French, who are leaders in the use of armoured concrete, believe in light and air where power-station buildings are concerned, and a new lay-out facilitates this practice, of which Comines is a good illustration.

Australian Industrial Progress.

A large part of the report by Mr. R. W. Dalton, Senior Trade Commissioner in Australia, which we review in this issue, is devoted to the consideration of the Commonwealth's industrial expansion. This is being sedulously fostered by a system of tariffs which, whether strictly economic or not, has certainly encouraged the establishment of Australian factories—some of them by well-known English concerns. It is not clear from the report how the Australian electrical industry is faring, but it is certainly true that imports of electrical goods, particularly from Great Britain, continue to increase, so that it may be said that the rate of expansion of the home industry is lower than the rate of growth of the demand.

Mr. Dalton endeavours to make clear the conditions governing the preferential admission of British goods into Australia, a matter regarding which there is a great deal of misapprehension. Another useful feature of the report is the advice as to agencies—not a simple matter in a country with an area of nearly three million square miles, and only about six million inhabitants.

An important factor in the engineering trade, although it is not mentioned in Mr. Dalton's report, is the bias for products of a certain country inevitably gained by the student who later becomes a purchaser of machinery or an adviser to purchasers. In the case of Australian student engineers, America fully realises her opportunities, and American manufacturers provide numerous facilities for young Australians who are embarking upon an engineering career. The Sydney correspondent of the *Daily Telegraph*, commenting upon this matter recently, said that British firms appeared to be less eager to afford these facilities. One obstacle which confronted the Dominion student in England was the reluctance of firms to pay a living wage, while there was no difficulty in securing this in the United States. The assertion is rather a sweeping one, for we believe that there are firms in this country who realise the value of early impressions gained by students, and afford the latter facilities of the kind mentioned. At the same time there is plenty of room for improvement, and we urge electrical manufacturers to give their fullest and most sympathetic attention to the matter.

Commercial Matters.

We are glad to note that certain of the institutions and associations are to some extent filling the gap that has long existed in the programmes of electrical discussions. Technical debates are essential for technical men, and the more there are of them the better it will be for engineers. But there are thousands of men connected with the electrical trade and industry who have little interest in purely technical subjects. For several years we have had evenings devoted to what are described as salesmanship conferences, and there have been attempts to promote non-technical discussions at informal meetings of the Institution of Electrical Engineers. But we are convinced that there are many men on the commercial side of the industry who would welcome an opportunity of putting their heads together regarding the matters that are vital to them in their everyday business-getting efforts. Is it that they have no platform? Or that there are few of them possessed of initiative or gifted with the ability to express themselves? Or are they afraid of giving something away?

Mr. J. W. Beauchamp went to Manchester last week to a meeting of the North-Western Centre of the I.E.E. to lecture on co-operative business building for the electrical industry, and we understand that he directed attention to some of the directions in which the industry is neglecting opportunities—a fine subject in connection with our admitted backwardness in pushing domestic electric apparatus such as the electric washing machine, the household refrigerator, the vacuum cleaner, and—in another department—industrial heating. To-night the British Electrical Development Association holds a meeting, open to all and sundry who wish to listen to an instructive talk from Mr. Ll. B. Atkinson on "Suggestion and Auto-Suggestion in Salesmanship." Our selling methods are an important matter to the commercial man whose business it is to deal with the trader and with the buyer, and if the men who are daily in the thick of the fight could be induced to get on their legs and let their tongues run freely there might be more life and vivacity in trade—who knows?

The Junior Institution of Engineers listened to an address entitled "Notes on Salesmanship" from Mr. A. J. Simpson, the chairman, on Friday last, a brief reference to which appears in our "Business Notices" to-day. The title is a very comprehensive one; perhaps for the purposes of useful or practical discussion it will ere long be found to be too broad, and will be split up into details. The points touched upon in our report show how full of interest the subject may become when we try to look at it as a practical trade subject. Perhaps we need to come down from the clouds a bit when we discuss such matters. There are salesmen and salesmen, just as there are buyers and buyers. There is room for all sorts, and if we try to set up an artificial standard of qualifications, we may discourage good men who never can conform to it. Many of the best qualifications of a business man are those gained by practical experience roughing it on the road and for a time inside the works where the goods are produced. Add to such experience personality, energy, and tact, and little more is needed for the sale of most manufactures.

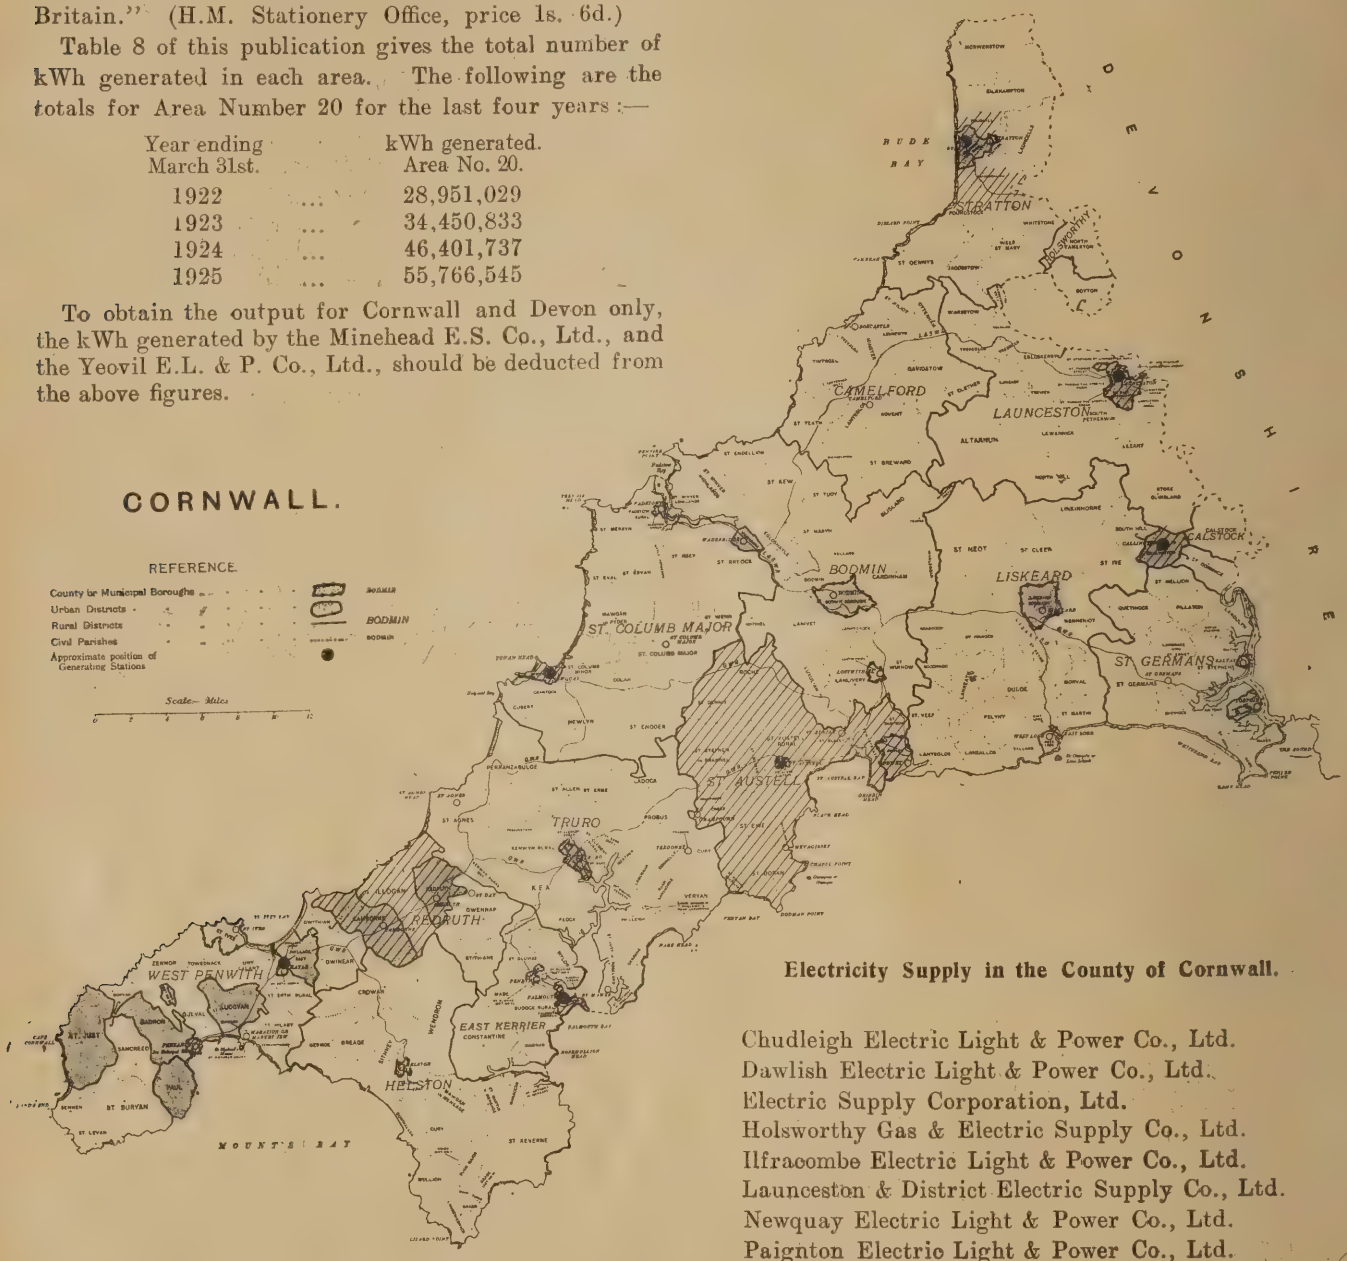
Overhead Line Regulations.

Travellers on the Continent cannot fail to observe that there the overhead electric light and power line is as common a feature of the country villages and roadsides as in this country it is rare. This is due, probably, to the fact that here more than anywhere else the use of underground mains has been almost universal and public opinion has not been accustomed to overhead conductors for electricity supply.

At present our regulations for low-pressure lines (not exceeding 650 V d.c. and 325 V a.c.) specify that allowance shall be made for a wind of 50 miles an hour at right angles to a line at 22 deg. F. coated with ice having a radial thickness of $\frac{1}{4}$ inch, and that the pressure shall be calculated on the whole projected area of ice-coated line. In this country all these four conditions might occur simultaneously, say, once in ten years at a few exposed localities. To cope with this remote contingency not only must the cost of all such lines as are constructed be very heavy—in thousands of cases it will forbid their construction absolutely. Again, the minimum height must not be less than 20 ft., though bridges need not be higher than 17 ft. The importance of reducing the minimum height for electric lines to 17 ft. is far greater than might appear; not only would it reduce the overturning moment on the poles, due to wind pressure, and thus enable lighter as well as shorter poles to be used—it would also facilitate negotiations for crossings with the Post Office, and the aggregate saving would be very considerable. Precautions have to be taken to earth broken wires and to trap leakage. For higher pressures the regulations are still more stringent, especially where lines run along or across public roads and railways, or near other overhead lines, or near buildings, including those served.

In country districts, too, the enforcement of the urban regulation restricting pressure variations to a maximum of 4 per cent. up or down is inappropriate. Wider variations must necessarily be allowed. The essential is to cheapen the supply to the country dweller, even at the expense of uniformity of pressure and reliability of supply. It is well to aim at perfection, but foolish to reject everything that falls short of that ideal.

Electricity Supply in Great Britain.—IX.*



Cornwall and Devon.

No part of either Cornwall or Devon has yet been included in any Electricity District, but these two Counties, together with such parts of Somerset as are not included in the Lower Severn Electricity District as provisionally determined by the Electricity Commissioners, form Area Number 20 in the Annual Analyses and Summaries of "Generation of Electricity in Great Britain." (H.M. Stationery Office, price 1s. 6d.)

Table 8 of this publication gives the total number of kWh generated in each area. The following are the totals for Area Number 20 for the last four years :—

Year ending March 31st.	kWh generated. Area No. 20.
1922 ...	28,951,029
1923 ...	34,450,833
1924 ...	46,401,737
1925 ...	55,766,545

To obtain the output for Cornwall and Devon only, the kWh generated by the Minehead E.S. Co., Ltd., and the Yeovil E.L. & P. Co., Ltd., should be deducted from the above figures.

Electricity Supply in the County of Cornwall.

In addition to the Cornwall Electric Power Company, which has certain powers over nearly the whole of the County under the Cornwall Electric Power Act, 1902, there are 27 other authorised undertakers (whose areas are shown hatched on the maps) holding statutory powers for electricity supply in Cornwall and Devon.

The following is the list:—

Local Authorities.

Barnstaple Corporation.
Crediton Urban District Council.
Exeter Corporation.
Plymouth Corporation.
Sidmouth Urban District Council.
Tiverton Corporation.
Torquay Corporation.
Truro Corporation.

Companies.

Bideford & District Electric Supply Co., Ltd.
Brixham Gas Company.
Bude Electric Supply Co., Ltd.
Budleigh Salterton Electric Light & Power Co., Ltd.
Callington & District Electric Supply Co., Ltd.
Camborne Electricity Supply Co., Ltd.
Chudleigh Electric Light & Power Co., Ltd.
Dawlish Electric Light & Power Co., Ltd.
Electric Supply Corporation, Ltd.
Holsworthy Gas & Electric Supply Co., Ltd.
Ilfracombe Electric Light & Power Co., Ltd.
Launceston & District Electric Supply Co., Ltd.
Newquay Electric Light & Power Co., Ltd.
Paignton Electric Light & Power Co., Ltd.
Penzance & District Electric Supply Co., Ltd.
St. Austell & District Electric Ltg. & Power Co., Ltd.
Seaton & District Electric Light Co., Ltd.
Teignmouth Electric Lighting Co., Ltd.
Urban Electric Supply Co., Ltd.

With regard to the Company undertakers, it should be noted that the Electric Supply Corporation, Ltd., has undertakings each with its own generating station at Exmouth, Falmouth and Totnes. Similarly the Urban Electric Supply Co., Ltd., has an undertaking with its own generating station at Dartmouth, also supplying Kingswear; as well as separate undertakings at Illogan and Redruth, obtaining a bulk supply from the Cornwall Electric Power Company.

The Power Company also gives a bulk supply to the Camborne E.S. Co., Ltd., and to the Penzance and District E.S. Co., Ltd., and is arranging to supply in bulk to the Truro Corporation.

* Parts I-VIII of this series appeared in the ELECTRICAL REVIEW of October 9th, 16th, 23rd, and 30th, November 13th and 20th, and December 11th and 25th, 1925.

We understand that Crediton Urban District Council will obtain a bulk supply from Exeter Corporation.

All the other undertakers possess generating stations, as indicated on the accompanying maps.

The generating station of the Cornwall Electric Power Company is situated at Hayle, and Torquay Corporation's new power station is at Newton Abbot.

These maps, which were prepared by the Ordnance Survey Department for the Boundary Commission of 1917, are used by permission of the Controller of H.M. Stationery Office. Since 1917 the following alterations have been made:—

(1) The Parish of Forrabury and the Parish of Minster have been united to form the new Parish of Forrabury and Minster.

Electricity Supply in the County of Devon.

At the present time there does not appear to be any application for new territory in Cornwall, but the Fifth Annual Report of the Electricity Commissioners gives particulars of several applications in Devon. Another application which includes part of this County appeared in the London *Gazette* of May 19th, 1925 (page 3386). The area applied for in the County of Devon is there described as the Urban District of Axminster, the Parishes of Axminster Hamlets, and Chardstock, in the Rural District of Axminster. This area has been hatched on the map, as well as the other areas applied for previously.

The 1921 Census gives the following particulars for the Administrative Counties of Cornwall and Devon and the associated County Boroughs:—

Acres.	Persons.	Resident families.	Buildings not containing dwellings.
2,539,531	1,030,319	251,828	15,845

(2) The Parishes of Budock Urban, Falmouth Borough and Falmouth Town have been united to form the new Parish of Falmouth, co-extensive with the Borough of Falmouth.

(3) The Parishes of Lawhitton Urban, Saint Mary Magdalen, Saint Stephens by Launceston Urban, Saint Thomas the Apostle Urban and the Hamlet of Saint Thomas Street have been united to form the new Parish of Dunheved otherwise Launceston, co-extensive with the Borough.

(4) The Parishes of Tor Moham and Saint Mary Church have been united to form the new Parish of Torquay, co-extensive with the Borough of Torquay.

(5) Parts of the Parishes of Saint Austell Rural and Saint Mewan have been added to the Urban District of Saint Austell and the Parish of Saint Austell Urban.

X-ray Dermatitis Cure.—It is reported by the *Daily Mail* that Professor M. d'Arsonval, in a communication to the French Academy of Science, claims that growths caused by X-rays can be cured rapidly by high-frequency electric currents.

The Comines Power Station.

A French Central Station using Pulverised Fuel.

By THEODORE RICH.

(*Continued from page* 63.)

Boiler House Equipment.

The boiler equipment is distinctly interesting because with the same type of boiler, chain-grate stokers have been put into competition with pulverisers. The boiler house is in two bays, each 62.5 metres (about 204 ft. 5 in.) long and 28 metres (about 91 ft. 8 in.) wide, placed at right-angles to the turbine house, from which it is separated by means of a sort of alleyway used for pipes, pumps, distiller and tanks (see figs. 15 and 16).

The first section to be built contained 10 boilers, and two boilers have been so far installed in the new boiler house which is placed alongside the former. The main boiler floor is of armoured concrete, and the same construction is used for the coal bins. The house is founded on piles; owing to the fact that each boiler, with economiser, stack, bin, &c., weighs something like 600 tons great care had to be taken to get ample support for the armoured concrete stanchions which carry such a load. The main boiler floor is 5 metres (16 ft. 4 in.) above the basement and general ground level; two expansion joints are arranged lengthwise in the floor.

Each boiler house has coal bunkers of a total capacity of 600 tons, roughly one day's supply. There are 12 Babcock & Wilcox marine type boilers each with 1,000 square metres (10,764 sq. ft.) heating surface, each capable of producing 30,000 kg. (66,100 lb.) of steam under normal conditions, and 40,000 kg. (88,160 lb.) when forced; the normal steam pressure is 21 kg. per sq. cm., or approximately 300 lb. per sq. in.

Each boiler has a superheater of 500 sq. metres (5,382 sq. ft.) surface. The total temperature of the steam is 350 to 370 deg. C. (about 660 to 700 deg. F.). The boilers are fitted with water-level indicators, whistling alarms, and pressure gauges with illuminated dials. A dial pyrometer is fitted to the superheater. The feed is controlled by Copes automatic boiler level regulators. A Green economiser of 560 tubes, each 13 ft. long, is fitted over each boiler, the gases leaving at a temperature of about 200 deg. C. (392 deg. F.). Induced draught apparatus on the Louis Prat system with a double cone chimney reaching to 30 metres (154 ft.) above the economiser house floor, is arranged for each boiler unit, two fans being fitted to each chimney, each driven by a 21-h.p. motor running at 720 r.p.m. A 2½-ton monorail electric traveller made by the firm of Sevory-Bedu is arranged to run down the boiler house, while each line of economisers is served by a 2-ton Morris traveller, so that the tubes can be handled if necessary.

Eight of the ten boilers of the original installation were fitted with triple chain grate stokers, having a combined operating surface of 31.35 square metres, the stokers being driven by a 7.5-h.p. motor; the grates are fitted with a mechanical arrangement of the Besmer type for the removal of slag. Forced draught is applied by three fans per boiler, each giving 750 cubic metres of air per minute, driven by a 21-h.p. motor at 720 revs.

Pulveriser Plant.

Two boilers in the original installation were fitted with pulverisers, on the "Turbo" unit system, the two boilers so far placed in the new boiler house being on the same system. The coal having been broken to a size not exceeding about 1 inch cube before being delivered to the overhead coal bins falls down shoots into the pulverisers. Two pulverisers are placed on the boiler floor in front of each boiler, each being driven by a three-phase induction motor, of 90 h.p., at 1,450 revs. Fig. 5, p. 60, shows a pulveriser opened up. The coal enters by means of a trunk and passes through a variable feed arrangement. There are four beater wheels in series on a shaft revolving at high speed; a fan is placed on the main shaft, at the delivery end. The coal is broken by impact and not by grinding action against the walls. Air is sucked through the machine by the fan, the passage of this air tending to drive the coal towards the wheels, while centrifugal force tends to drive it outwards; by regulating the air supply the fineness of the product can be increased. The coal is sucked out by the fan and blown up a rising leg and comes down again dividing into three branches which slope into the boiler casing (fig. 7); there are, therefore, with two pulverisers, six burners per boiler. They deliver the coal into the furnace; the latter is of such an internal height and dimensions, 180 cubic metres (6,345 cubic feet) capacity, that complete combustion is obtained before the gases pass into the tubes.

When the first two boilers were installed three pulverisers were fitted to each boiler; as a result of adjustment and experiment the pulverising capacity of each machine was increased from 2 tons to 3 tons per hour without increasing the power absorbed, and two were then used per boiler. The normal quantity of coal dealt with by each pulveriser is 2½ tons per hour or 5 tons per boiler. The furnace temperature is 1,300 to 1,400 deg. C. (2,370 deg. F. to 2,550 deg. F.) with 14 per cent. carbon dioxide. The pulverisation is carried to an extent which will pass 65 per cent. through a grid of 200 mesh per lineal inch, 90 per cent. through 100 mesh and 100 per cent. through 50 mesh. The fire brick lining is 57 cm. (22.4 in.) thick, with a layer of diatomite, and then a 5 cm. (2 in.) cavity. The brick, which will resist 1,750 deg. C. (3,180 deg. F.), has a composition of 38 per cent. alumina. The brick linings of the first two boilers installed have been in use for four years, and have given no trouble worth mentioning. The pulveriser boilers are being worked for about 5,000 hours per year.

Each boiler is fitted with two auxiliary fans driven by 16-h.p. motors, but these, however, are only put into use when the boilers are being forced beyond the normal output of 30,000 kg. (66,000 lb.) of steam per hour. Like the boilers with chain-grate stokers, two Prat system induced draught fans are arranged alongside the chimney, but the operation of these is not necessary for combustion, they are only set to work when the dust is being blown out from among the tubes. The operation of the boilers with pulverisers has not given rise to any boiler troubles. There have been no tube failures; the use of distilled water for make-up feed may, however, be one factor in this matter. After experience with two boilers in the original boiler house it was decided to use pulverisation for the extension. The director of central stations of the Energie du Nord Co., M. Orango, holds the opinion that the ample combustion space has a great deal to do with the satisfactory operation. It is found that with this type of stoking apparatus steam can be got up very quickly; the losses through banking up can, therefore, be largely reduced. Practically all the carbon in the fuel is burned up.

Comparison with the Chain Grate Stoker.

A good deal of harm has been done to the cause of many engineering developments, by claims that this or that scheme is a sort of universal pill suitable for all situations, results being heralded which do not pan out in practice. At Comines the coal is delivered from various seams and collieries; it is analysed on arrival and mixed so as to give what experience has shown to be the best results for each type of stoker. The ash content is high, up to 25 per cent., the coal being unwashed; the heating value is about 11,500 B.th.u. per lb. and the volatile matter 15 to 16 per cent. The coal from the dump is handled in a similar way in both cases, it comes down from the bunkers in trunks to the

chain grates and to the pulveriser. The space required in a boiler room does not materially differ with the two systems, as room has to be allowed for chain grates to be drawn out, and the two pulverisers stand in line in front of each boiler. Under conditions ruling at Comines it is found that for each boiler the pulverisers take from 150 to 180 horse power, or about 2.5 per cent. of the output of the boiler, neither the auxiliary fans nor the Prat induced draught ventilators being usually required.

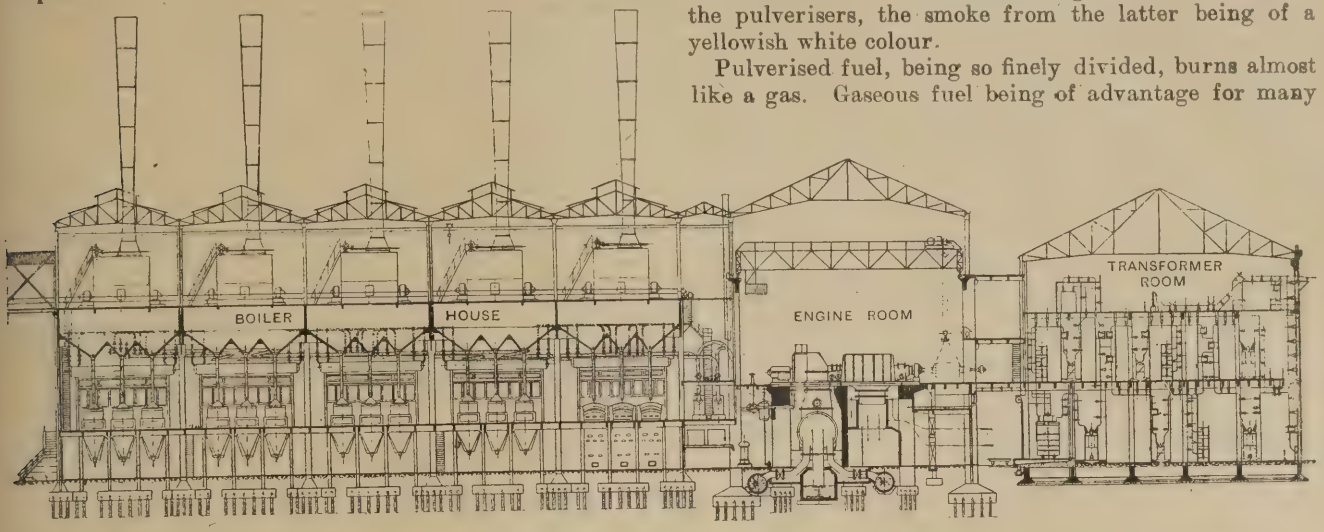


Fig. 15.—Comines Power Station: Sectional Elevation.

With the chain-grate stokers for about the same evaporation the power required is as follows:—Chain grate drive, 7.5 h.p.; three forced draught fans of 25 h.p. each, 75 h.p.; two Prat induced draught fans, 20 h.p. each—total 122.5 h.p., or about 1.9 per cent. of the power of the boilers. The boiler efficiency under test conditions comes out at about 84 per cent. with pulverised fuel and 80 per cent. with chain grates, while under normal running conditions the proportion is about 80 per cent. to 74 per cent. There is also the point that one man drives two pulveriser boilers while one man is put on to each one fitted with chain grates. These figures show that under the circumstances which exist at Comines regarding fuel and operating factors, where efforts are made to get the best results out of each type of stoker, after allowing for the increased power consumption of the pulverisers over the chain grate stokers and fans, there is an ample margin of economy for the former over the latter. It is understood that so satisfied are the users that when the chain grates require renewal they will be replaced by unit system Turbo pulverisers.

Comines power station lies a few hundred yards outside the town of the same name. Except in the direction of the town it is surrounded by open fields. There is but little smoke from the chain grates and less from the pulverisers, the smoke from the latter being of a yellowish white colour.

Pulverised fuel, being so finely divided, burns almost like a gas. Gaseous fuel being of advantage for many metallurgical, ceramic, chemical and other industrial processes, it is of interest to note that in France the makers of this pulveriser have supplied a number for various classes of industrial furnace work; it is only comparatively recently that economy in fuel has been seriously studied in many forms of industrial heating.

The Turbo pulverisers were supplied by a French company, "La Combustion Rationelle," of Paris, the English makers of plant on the same system being Messrs. Clarke, Chapman & Co., Ltd., of Gateshead.

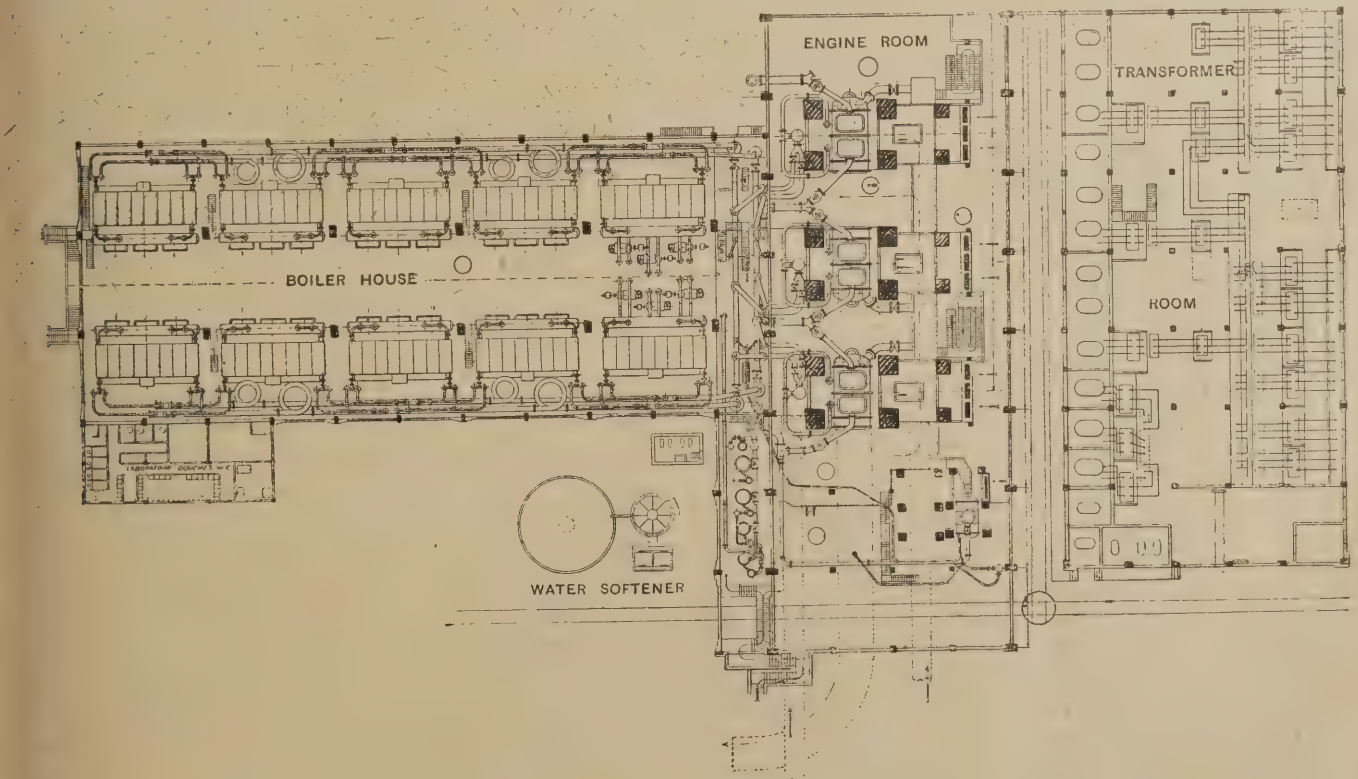

Fig. 16.—Comines Power Station; Plan of First Section.

Circulating Water System.

When the lay-out of the power station as a whole was under consideration, owing to the unsatisfactory subsoil and the urgent necessity for rapid completion, it was decided to avoid as far as possible the excavation

of deep trenches across the site, as not merely would it tend to diminish the stability of the foundation, but also owing to the timbering, pumping, &c., required it would seriously delay the completion of the whole installation, besides being costly.

It was decided, therefore, to put a pump house at the riverside and to install two circulating pressure mains with branches to individual turbines, the flow of water to each condenser being regulated by sluice valves, in lieu of the use of separate circulating pumps for each turbine. A pump house was constructed on the river bank 27.9 metres (91 ft. 6 in.) long and 10.10 metres wide, the floor being 3.2 metres (10.6 ft.) below flood level; the walls, which are of armoured concrete, were made watertight. A ten-ton electric overhead traveller is arranged to handle the plant.

The condenser water flows through double grids into two armoured concrete suction chambers, each having a floor level 2.65 metres (about 8 ft. 8 in.) below the normal level of the river; they are 5 metres (16 ft. 5 in.) wide and have a combined length of 22.8 metres (about 90 ft.). The inlet from the river is 11 metres (36 ft.) wide.

To protect the inlet there is a floating boom arranged with a duck-board so that a man can walk along it to clear away floating rubbish. There are also two sets of grids; the outer one is fixed, and in front of it is a trench for the deposit of mud, which can be washed away by special pumps. The inner grids are arranged so that they can be lifted and cleaned by water jets.

The pump house contains four Rateau type horizontal centrifugal pumps, working up to 12 metres (37 ft. 8 in.) head, two of which usually suffice for the load; each is driven by a three-phase induction motor of 450 h.p. at 730 r.p.m. at 220 volts. Two geared pumps driven by motors are used for priming. The main pumps deliver into a common cross header which can be separated into two parts by a sluice valve, the header being connected at the ends to two armoured concrete pressure conduits of 1.8 metres (5 ft. 11 in.) internal diameter running longways under the turbine house, from which branches controlled by valves are taken to the individual condensers, one branch from each conduit; the condenser discharges flow into a rectangular conduit running under the condenser bodies. Arrangements are made so that as soon as the capacity of the river is exceeded, cooling towers may be erected and the incoming water mixed with suitable proportions of cooling-tower discharge water.

Two 1,000-kW 10,500/220-volt three-phase transformers are placed in an annexe to provide power for the pump house. The transformer cubicles are arranged in a manner similar to those shown in fig. 13, p. 62.

(To be continued.)

Electricity Showrooms.

By W. A. GILLOTT, A.M.I.E.E.

THE question of showrooms for an electricity supply authority is one that, unfortunately, does not receive the attention it deserves, taking the country as a whole. There are comparatively few really good showrooms in existence; where they are in evidence, it is in places where the demand for a supply of electricity is rapidly increasing.

One of the first questions asked when a show-room is suggested is:—"Are showrooms necessary?" It is agreed that a supply authority has a valuable product to dispose of, and by supplying more energy it not only brings profit to itself, but provides means to relieve the monotony of work by the use of labour-saving appliances. The employment of electricity assists to prevent accidents, enables a building to be warmed in a hygienic manner, cooks food, cleans the air, and generally makes for a more healthy race. It is essential, however, that the people who are to receive these benefits, must be shown how they can be obtained by the aid of electricity. There still exists the mistaken belief, that everybody knows that one can cook, heat, clean, wash, &c., by electricity; it is true that a large percentage of the public has *heard* that electricity can be used for such purposes, but it does not *know* it. At a recent electrical exhibition in a town of nearly a quarter of a million inhabitants, many visitors were surprised to learn that electric cookers were actually in use, and the demonstration of an electric bed warmer was witnessed with astonishment. Such instances demonstrate the need of educating the public by direct application. Press advertising is necessary to create the interest; electrical exhibitions fill the part of stimulating that interest; and the showroom, with its congenial surroundings and well displayed appliances, is necessary to secure the order.

Can We Afford a Showroom?

It is not proposed to reply to this question by a plain "yes" or "no," but to give its answer in another way. Above it is shown how necessary it is to have a shop window for the power station to promote the extended use of electricity, and authorities who have not operated an up-to-date showroom cannot realise the business-pulling power which they possess, if properly managed. I have had experience with electricity showrooms where a turnover of some thousands of pounds per annum is done in counter sales—without taking from or upsetting the electrical contractor, and I will refer to him later—in cases where authorities have, or do not have, selling powers, and the result of this is also seen in the yearly returns of output. In one case of which I know, where it had not been the policy to appear in public, it was decided to establish well-appointed showrooms, and by the end of the first year the undertaking was able to trace the effect of this to the tune of nearly a million kWh increase in domestic consumption. In another instance, after showrooms had been opened but a few weeks, the station superintendent reported an appreciable increase in the demand on the station at midday on Sundays, and another undertaking found that it was able to induce shopkeepers to continue their window lighting until late at night. The effect of this showmanship was to earn more revenue, and by encouraging the class of load which the station needed, to materially help in filling up the "valleys" and secure a general improvement in the station costs. The trade slump of 1921 was felt by almost every supply authority, but I know of stations that were able to maintain their profits by an increase in domestic load. It is a fact that whatever the state of industry, people must eat, and it is "up to" the supply authority to see that they eat food cooked electrically. Another aspect is that a consumer has the right to expect (I was going to say require) the supply authority to keep him abreast of the times, show him the benefits of employing electricity, and how to use it to the best advantage, to enable him to extend its use in his home, office and factory, bringing in its wake increased output and profit to the undertaking. An undertaking cannot afford to be without a showroom. It is an excellent form of advertising, producing good results if it is properly managed.

What Form Should the Showroom Take?

Upon the assumption that it is agreed to proceed with a showroom, the next consideration is to be given to its type; this naturally depends upon the class of district covered by the supply authority, and, therefore, local conditions will determine to a large extent the way in

which the building will be equipped or laid out. It may be a palatial establishment complete with an Electric House, model works, kinema, ladies' retiring rooms, lounge with afternoon tea, smoking-room with morning coffee, shop windows arranged for each trade in the district, lecture hall, &c.; or, to go to the other extreme, a small shop with a model kitchen behind. Whatever the size of the building, one object must never be lost sight of, that is, the essential feature of exhibiting the goods in as nearly as possible their normal surroundings. Do not show a table standard with its delicate silk standing on top of a cooker, or a bowl fire on a shelf 8 ft. from the floor. If a small shop only is available it requires but a little more ingenuity to reach the necessary standard of dressing. The first care is to see that every section is properly illuminated; the window should have a minimum of 100 W per foot frontage, spot lights, colour lighting, signs, time switches, &c., all fixed in their proper position and shown working. The electric fire needs a suitable base in a fireplace, or if of the dog grate type, it will look better on an open hearth with the mantlepiece complete; the electric iron should be placed on an ironing board; and the cooker in the kitchen. Where space is limited arrangement can be made for dealing with single subjects at different times, leaving, of course, a section free as a general exhibit. Sufficient plugs and switches or other outlets should be fitted; they are all needed for quick demonstration. A client visits the showroom to obtain ideas of how his home or shop may appear when electrified; it should, therefore, be the endeavour to show the appliances performing the work which they are designed to do, so far as circumstances will permit. The showroom should educate the client in a pleasing manner how to use electricity correctly. Apart from this, goods well shown are half sold.

What of the Electrical Contractor?

The electrical contractor is a necessary link in the chain of progress. It will be admitted that there exists in some districts a feeling of unwillingness to get together, but if the subject is properly handled, both sides can secure lasting benefits to their mutual advantage. It is not intended to give schemes of co-operation here, but to any interested body which would like details of such an arrangement, I should be pleased to submit proposals that would secure the desired result. Almost in every district, where a supply of electricity is available, much greater progress could be made if contractor and supply authority worked together, each having the one object in view, *i.e.*, more consumers. The potential business is enormous but, to secure it, capital, vision and goodwill and new methods of marketing are needed, and co-operative working is but one of the procedures to adopt. Each section should do its utmost and stand by its own results after a proper understanding in working methods has been arrived at. There are districts known to us all where such happy circumstances exist; it is the extension of this that will help to bring us nearer really inexpensive installations that all may receive the full benefits that electricity can provide.

The Next Step.

The stage is now reached where these items are to be put into operation; the question of tariffs, hiring schemes, &c., are all agreed upon and premises secured. This is the critical period of the whole situation, and in order to obtain the best possible results, it is advisable to place the whole scheme in the hands of one who is experienced in these matters. If such an individual is not on the staff, he should be found. If this course is adopted, the foundation of increased output, more profit and better service is established.

Electric Fires.

A Few Notes on the Types of Heating Elements.

By A STATION ENGINEER.

In a recent issue of the ELECTRICAL REVIEW a writer dealing with this season's fires remarked on the multiplicity of designs and questioned the advisability of so many. Undoubtedly, for a comparatively new industry we have far too many types of fires, and when such an old-established industry as the gas apparatus suppliers have found the need to introduce and very extensively advertise a standard model gas cooker and certain standard types of gas fires, surely it behoves the electric fire manufacturers to get together and produce a few standardised models and advertise them in the lay Press. By all means let each manufacturer have complete freedom of action regarding the appearance of the fire, and if they wish, let each manufacturer continue to put any type of heating element he likes on the market, but let us have—and very quickly too—a standardised type of element which, of course, must be of the plug-in type.

As I write I have before me the catalogues of many fire manufacturers running back for some years, and it is amazing to note how many have changed their element designs nearly every season. I may be prejudiced in favour of a particular type of element, but let me say right away that as a supply company engineer with experience in eight different undertakings in various parts of the country, I have yet to come across a burnt-out element where such an element has consisted of a fire-clay former built up in multiple with steel supports of some sort, and the heating spirals wound on *without* any pinning to the fire-clay. Dr. Ferranti has often shown remarkable foresight in design, and whether he was personally responsible for the Ferranti fire or not, the Ferranti fire element was built up of small fire-clay units steel supported, and to my mind was an excellent job. It has not been manufactured for some years now. To-day I can only trace five types of fire elements built up in multiple and two types in which the multiple principle has been partly followed by supporting two or three fire-clay sections on steel. I regret to note that the manufacturers of the last two types are putting them into the background. Second in reliability I have found the old 500- and 600-watt fire-clay bar in which the spiral is run in vertical grooves and hooked on top and bottom. This bar is now being superseded by the 1,000-W bar, and I am afraid it is with the 1,000-W bar that so many makers change their designs frequently. There are several makers who have succeeded in producing a 1,000-W solid bar element and who have so designed the fireclay that no pinning or clipping of the heating spiral is necessary. Why several well known makers who previously made really good 500- or 600-W bars now persist in pining the spirals of their 1,000-W bars to the fireclay, passes my comprehension. Personally, I have had nothing but trouble with this type due to "hot-spots" developing. It is no easy matter to stretch out the spiral to the necessary length, fit it in the grooves and then insert several dozen small split pins and still keep the turns evenly spaced to prevent "hot spots." One maker uses no fewer than 44 small split pins in a 1,000-W bar, and it is an impossibility for the average contractors' electrician to satisfactorily fit a new spiral under 40 minutes.

In referring to my ideal element as a firebar built up in multiple, I do not include the reflector type of element in which some 6 to 12 small fire-clay bridges are fitted in a polished reflector. I believe the reflector type will soon die a natural death, and that any reflector

effect required in any particular design of fire will be obtained by a reflector that is part of the fire frame.

In conclusion, by all means let makers continue to produce their own elements, but at the same time let them get together and decide on a standard plug-in bar, standardised as to distance between centres of the plug-in pins and standardised also as to width. In a few years it should be possible for one to walk into a shop and take home a 500-W or 1,000-W plug-in bar and fit it oneself just as we do with lamps. How often does an electric fire manufacturer advertise his products in the daily Press?—one or two do very occasionally, most of them never. Standardisation should cheapen manufacturing costs, and the pooling of advertising resources should enable frequent announcements to be made in the daily Press. Advertising must be continuous to be successful, and I feed sure that contractors would as a whole be satisfied with smaller trade discounts on well-advertised fires as the turn-over would be so much greater.

The Physical Society's Exhibition.

Annual Display of Electrical Instruments and Scientific Apparatus.

PROMOTED by the Physical Society of London and the Optical Society, this show is an event in the scientific calendar. It is held at the Imperial College of Science, South Kensington (January 5th to 7th, inclusive), and is looked forward to as an opportunity to view the latest products of the leading instrument makers. This year, however, the Councils of the above-mentioned Societies extended the scope of the exhibition, the sixteenth of the series, by including, in addition to the usual trade display (in which some 72 firms participated), three new classes of non-commercial exhibits, namely (*a*) exhibits illustrating the results of recent physical research and improvements in laboratory practice, (*b*) selected examples of effective lecture experiments, and (*c*) repetitions of famous historical experiments in physics.

The object in view, in the case of classes (*a*) and (*b*), was to afford teachers and research workers an opportunity for interchanging ideas and disseminating information on matters relating to their work in practical physics. The exhibits in class (*c*), it was anticipated, would not only interest the scientific worker, but would also be of value as a means of impressing upon members of the general public (who had an opportunity of attending the exhibition on the third day) the connection between the lesser-known fundamental physical phenomena and their more widely-known practical developments.

Amongst the short lectures that had been arranged was one by Prof. A. F. C. Pollard, A.R.C.S., A.M.I.E.E., on "The Mechanical Design of Instruments," and another by Major W. S. Tucker, D.Sc., on "Electrical Listening." The collection of exhibits included several ingeniously constructed novel instruments, and electromedical apparatus was also displayed this year, particularly artificial sunlight lamps.

Cambridge Instrument Co., Ltd.

In accordance with its usual custom, the company had one of the largest displays in the show. Among the electrical instruments we would draw attention to a new electrometer (fig. 1) originally designed by Professors A. H. and K. T. Compton, the principles upon which it is based having already been published. The instrument possesses high sensitivity which can be quickly adjusted to any required value over a wide range, while at the same time it is practically constant over a large range of deflection.

The Duddell oscillograph outfit (fig. 2), first exhibited a year ago in the experimental stage, is now being manufactured for commercial use rather than only for laboratory experiments. It has the advantages of adaptability, robustness, and portability, while the ease with which it is operated adds considerably to its value as a commercial instrument. The outfit is constructed almost entirely of metal; it may therefore be readily moved from one place to another without risk of damage, and can be brought into close proximity with the problem under consideration. The outfit is designed to enable simultaneous records to be obtained from three vibrators, which may be any combination of the electromagnetic and the electrostatic types; in addition, the standard outfit comprises a revolving-drum camera with mechanism for exposing the film or paper, focussing lenses, and a small metal-filament lamp. The uncertainty of operation associated with the electric arc is thus avoided, and in order to obtain the high intensity of illumination required for the photographic recording of the wave form, the lamp is considerably overrun during the period of exposure. By means of a system of rotating mirrors, the wave form under investigation can be observed right up to the moment of exposure.

The vacuum thermo-element designed by Dr. Moll (fig. 3) is based upon the fact that if a thermopile is placed within a vacuum, its sensitivity is considerably increased, while there is also the distinct advantage that disturbances due to air currents are eliminated. Thermopiles constructed in this way have not hitherto yielded the result which might have been

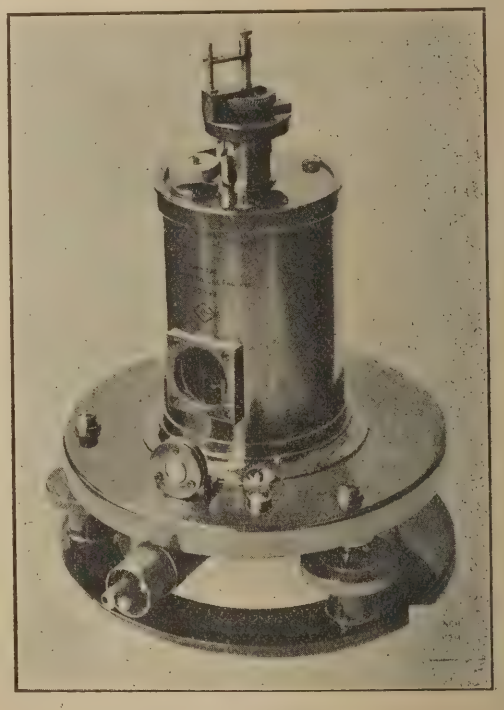

Fig. 1.—A New Electrometer.

expected, owing to the great heat capacity of the thermo-element, but by making use of extremely thin strips of metal, Dr. Moll and Dr. Burger have succeeded in designing a vacuum-element having a sensitivity about 100 per cent. higher than in air. It consists of constantan and maganin strips, brazed together, and blackened on one side; the strip is less than 0.001 mm. in thickness, even at the junction of the two elements, and the thermopile is mounted on platinum wire fused into a glass envelope, which is exhausted to a high degree of vacuity. In order to protect the thermopile against unequal heating, the glass is enclosed in a metal case, having double walls insulated from each other. Windows are provided on opposite sides of the case, that in front being fitted with a worked glass plate, which can be replaced, if desired, by a microscope slide cover glass, or a microscope objective. The window at the rear is fitted with a lens, so that the position of the thermopile may be adjusted relatively to the other parts of the apparatus. This thermo-element is particularly suitable for spectrum work, and is extremely rapid in action, the position of equilibrium being obtained within three seconds of the time of throwing the radiation on to the thermopile.

An electrocardiograph outfit was exhibited in an improved and simplified form, designed for operations from a 12-volt

electric battery. The illuminating source of light is a 50-c.p. half-watt type lamp, and a suitable rectifier, which enables the battery to be recharged from an alternating-current supply, is included.

A vertical force magnetograph with Helmholtz-Gaugain standardising coils, which the Company is supplying to the

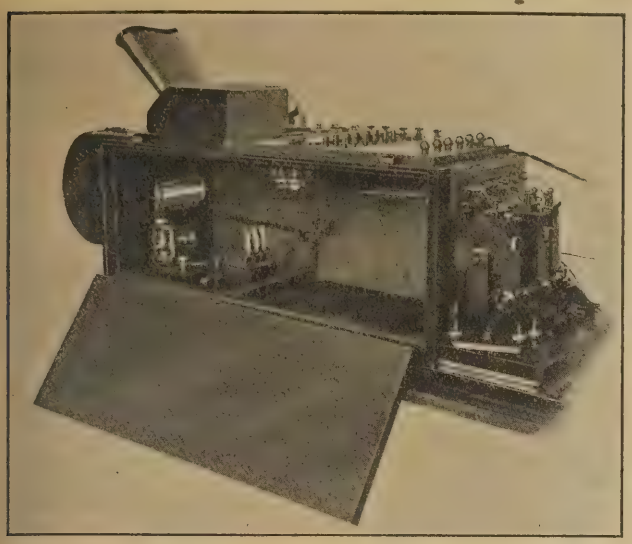

Fig. 2.—Improved Duddell Oscillograph.

Royal Observatory at Hong Kong, is of the Watson type; two tungsten steel magnets, mounted on either side of a platinised quartz mirror, are supported by two quartz fibres stretched in the same plane as the mirror, the system being kept taut by means of a quartz spiral spring. The design provides automatic compensation for changes in temperature, and

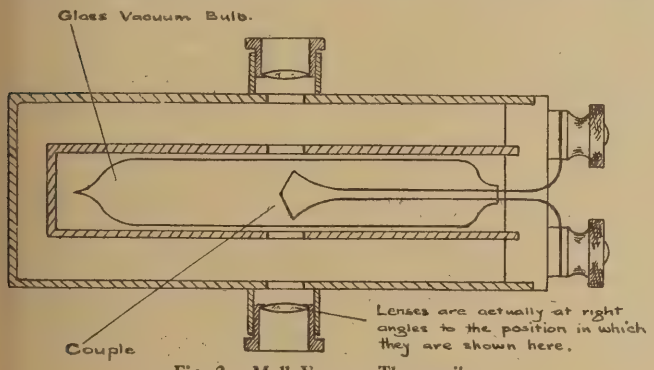

Fig. 3.—Moll Vacuum Thermopile.

the sensitivity is such that approximately 1 mm. is recorded on the chart for a change in magnetic force of 5 γ.

An instrument that should be better known is the "Cambridge" Unipivot galvanometer; this versatile instrument, by fitting a millivolt scale for d.c. and a thermal scale for a.c. work, can be used for the measurement of current or pressure

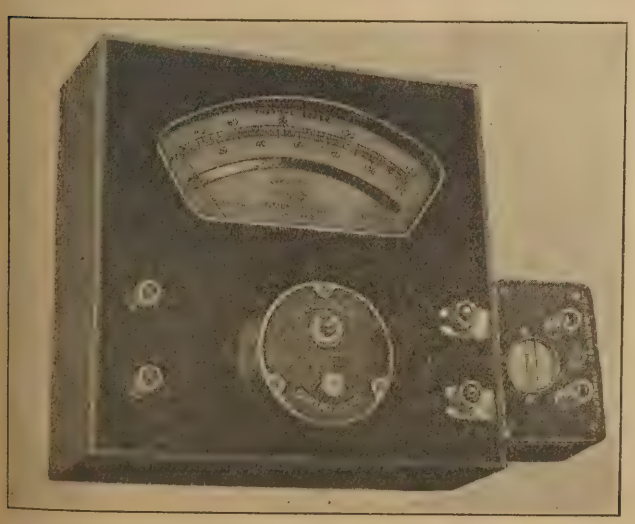

Fig. 4.—"Cambridge" Unipivot Galvanometer.

of either type over a range that can be varied with the aid of easily-attached accessories (fig. 4). Its application may be extended by the use of range multipliers so chosen that the current or pressure being measured is ascertained directly by applying a simple factor to the reading of the galvanometer. The multipliers are arranged for direct connection by means of tongues, as shown, but tapered holes enable connections to be made at a distance by plug-ended leads; they are interchangeable and made to cover ranges of pressure or current, one pattern being arranged for measuring both voltage and amperage without the necessity for changing connections. Alternating current, of high and low frequency, may be measured in conjunction with thermal converters, which are independent of frequency errors. The device consists of a thin wire heater of refractory material, to the centre of which is attached a fine thermo-junction; a.c. passed through the heater raises the temperature, which is measured by the thermo-junction on the millivoltmeter, the deflection being

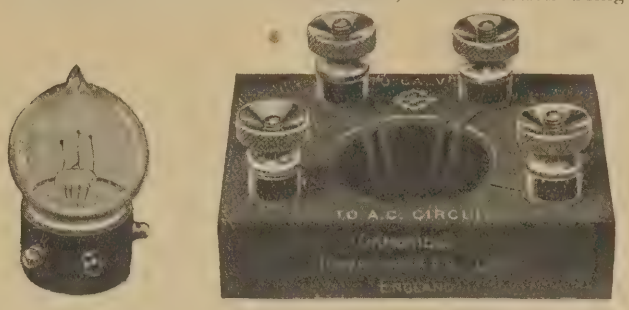

Fig. 5.—Vacuo-Junction.

proportional to the square of the current through the heater; the heater and thermo-junction are enclosed in a glass bulb (fig. 5). Converters are made in two ranges: one for use in conjunction with a.c. range-multipliers for pressure measurement, and the other for current measurement. For high-frequency work the heater is formed of two 0.05-mm. diameter iron and constantan wires looped together at their centres to form a cross. The accessory has a cover that acts as an electrostatic shield, which is completed by the case of the Unipivot instrument being connected to the moving coil.

The diagram (fig. 6) illustrates a millivoltmeter with a thermal converter (in the centre of the diagram), containing the thermo-junction JT in series with a small adjusting resistance r connected across its tongues. A heater H, together with

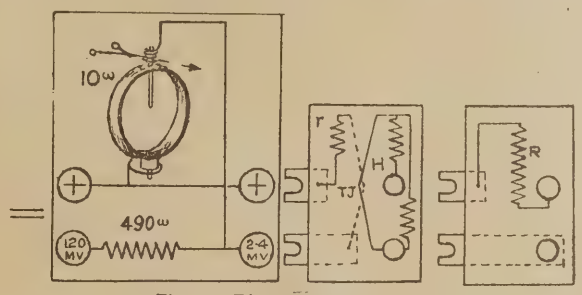

Fig. 6.—Diagram of Connections.

a small shunt and series resistance, is connected between the terminals of the converter. The a.c. range-multiplier (to the right of the diagram) contains a high resistance R in series for reducing the pressure at the converter terminals.

Marconi's Wireless Telegraph Co., Ltd.

In addition to an automatic call key and 4-seconds alarm device, various radio receiving sets were to be seen on this stand. In particular, the short-wave receiver shown in fig. 7, which has a wave range of from 15 to 100 metres, is a reproduction of the experimental apparatus used in Senatore Marconi's yacht for the interception of short-wave signals from

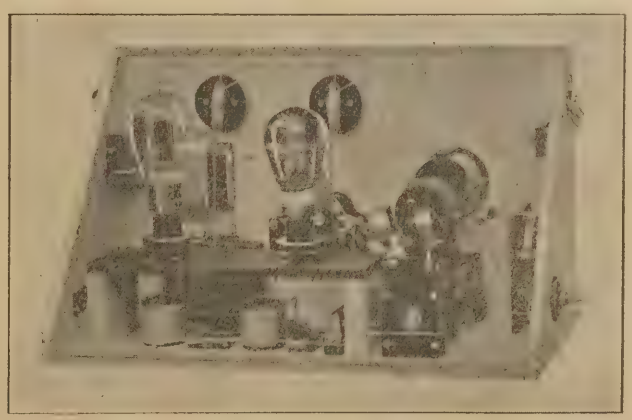

Fig. 7.—Marconi Short-Wave Radio Receiver.

the Poldhu station. Two valves are used, a detector and a low-frequency amplifier, the apparatus being designed to employ Marconi D.E.5 valves. An aerial, either of the "T" or "L" type, 50 to 150 ft. long, is suitable, but it is essential that it should be out of tune with the incoming wave, both as to fundamental and harmonics, and its tuning must always

be over the wave-length to be received. Two sets of tuning coils are supplied, together with a calibration chart for each receiver. The respective ranges of the coils are 15 to 40 metres and 35 to 100 metres. Three 40-volt dry batteries supply the high voltage for the receiver, the detector taking 80 volts and the low-frequency amplifier 120 volts. The broadcast receiver shown in fig. 8 employs no reaction whatsoever. It is composed of five h.f., one detector, and two l.f. stages. Each of the h.f. stages is tuned and separately controlled, adjustments for each being made by rotating the control dials to the wave-length marked on the scales. The circuit is "straight" and has its valve capacities balanced on what is claimed to be a unique method. A volume switch is incorporated in the set. Six D.E.3 and two D.E.5 valves are used, making the total current

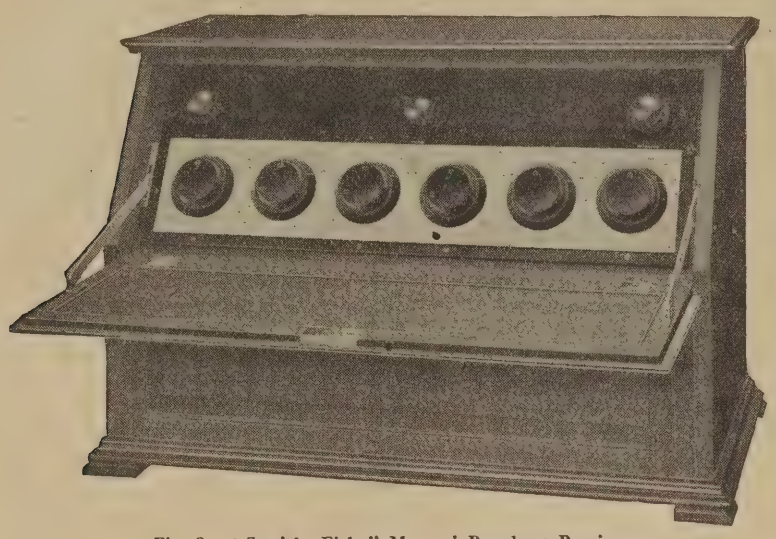

Fig. 8.—"Straight Eight" Marconi Broadcast Receiver.

consumption .68 ampere, using a 6-volt accumulator. Longer wave-lengths than the broadcast band are receivable on this model by additional coils. The h.p. batteries are housed in the base of the instrument; the selectivity is such that reception from stations immediately above or below the London wave-length can be obtained within four miles of 2LO.

(To be continued.)

Electricity Supply in Russia.

Various subjects were discussed at the Pan-Russian conference of representatives of municipal electricity supply works, which was held in Moscow during the third week in December. Dealing with the general situation of the industry, Mr. V. L. Levi pointed out that out of the 5,258 generating stations throughout the country 693, or over 13 per cent., were municipal or regional stations. The average capacity of the municipal stations was 34 per cent. of the average capacity of all the stations, *viz.*, 767 kW. Almost one-half of the plant was in Leningrad, Moscow and Baku. From 1917 the number of stations began to increase, the augmentation having been specially active in the past year. Down to 1923 the works constructed were principally of small size, but since then the average capacity had been raised to the pre-war level.

Internal combustion engines, the author proceeded to state, occupied a predominating position in the small stations, 50 per cent. of the stations being provided with that type of plant, while steam turbines were employed in the large stations. The total value of the stations amounted to about 220,000,000 pre-war roubles in 1923, and since then a total of 250,000,000 roubles has been expended, principally on regional stations, so that the capital invested in these undertakings has more than doubled in the past year or two. On the average about 27 per cent. of the plant in the works was out of service in 1923, while in 1924-25 the percentage of idle plant was further increased, except in the case of the works in Moscow and Leningrad. This circumstance is said to testify to the fact that the plant in the municipal stations has to a considerable degree become obsolete. As to the question whether the stations succeed in meeting the demand, it was mentioned that the load represented 71 per cent. of the capacity in 1924, whereas in 1925 more than half of the works had been operated without any reserve plant, and 16 per cent. were overloaded. The principal feature of the municipal stations was that their load was mainly lighting, 60 per cent. of them not having any industrial customers, although some improvement in the utilisation of the stations took place in 1924. The speaker expressed his preference for small stations, considering that large works were only of greater advantage where a reasonable demand already existed, which was seldom the case with Russian stations.

Mr. U. K. Mitlyan stated that the main problem of municipal stations consisted in the restoration, reconstruction and extension of the existing stations, and the effective administration of the industry. Funds for capital expenditure must be derived, in the first place, from amounts set aside for redemption, and profits. In individual cases funds could be obtained from consumers in the shape of credits granted or shares taken up in the stations. But the basic source of funds for the establishment of new municipal stations must be the granting of long-term loans by the Central Communist and Electrical Banks, which should organise a consortium for giving credit to municipal stations in conjunction with the Industrial and State Banks. The author held that all the stations should be placed on an economic basis by the charging of adequate tariffs, the organisation of redemption funds, the development of the load, and the preparation of correct forms of accounts.

The fuel question was dealt with by Dr. A. V. Volkenau, who stated that the stations used Donetz coal and liquid fuel to the extent of 47 per cent., local mineral fuel to the extent of 44 per cent., and wood to the extent of 9 per cent. As in the next few years there would be a shortage of coal and naphtha as a result of the development of the metallurgical and other industries, it would be impossible for the municipal stations to obtain all the fuel of high calorific value which they required, and they must therefore devote more attention to the use of local fuels of inferior quality, or pulverised coal.

Mr. I. M. Rusak spoke of the success which had attended the scheme of one of the Leningrad stations for the supply of hot water to certain undertakings such as hospitals and baths by means of special pipe-work. It was considered that a considerable scope lay in this direction for new stations.

Dealing with the cost of generation, Mr. M. K. Polivanoff stated that this was at present far too high. A considerable reduction in expenditure would be rendered possible by the erection of large units, a path upon which the Russians had recently embarked. Thus at the Schatur station it was proposed to install 35,000-kW turbo-generators and machines of from 25,000 to 30,000 kW at the Kaschir station, while machines of the same size were projected for Leningrad. Moreover, the success which had attended the use of peat and Southern Moscow coal had rendered possible the erection of boilers with a large superficial heating surface in conjunction with generators of large size; and reference was also made to the use of pulverised coal. At present the boiler efficiency was very low compared with that which was being obtained in the United States.

Many other questions were discussed at the conference, including the grant of credits to municipal stations during the current year (1925-26).

Electricity on Board Ship.—That modern passenger-carrying liners are usually fitted with large electrical installations is well known, but it is not often realised that cargo ships also use electricity to a considerable extent. The M.V. *Upwey Grange*, the latest addition to the Houlder Line, was built by the Fairfield Shipbuilding & Engineering Co., and is of more than usual interest in that she is said to be the largest and fastest refrigerated cargo vessel afloat. The propelling machinery consists of two 3,200-b.h.p. Fairfield-Sulzer Diesel engines and the ship will be used chiefly for carrying chilled meat between Argentina and London, the refrigerated space provided representing a capacity for 260,000 carcasses of mutton. The whole of the electrical material has been manufactured and supplied by the General Electric Co., Ltd. The generating plant consists of two "Witton" compound-wound d.c. generators, each of 25 kW, at 100 volts, coupled direct to reciprocating engines. The main switchboard consists of two generator and two feeder panels, whence cables run to iron-clad distribution boards in various parts of the ship, from which sub-circuits are run to teak-cased fuse boards for lighting. General lighting is provided by means of Osram ship-type lamps, in addition to a large number of Osram gasfilled lamps. Brass and white-metal pendants with obscured globes are used in the cabins, wellglass fittings for the alleyways and shelter deck lighting, the weather decks being lighted by guarded bulkhead fittings, and the engine room by gasfilled lamps in industrial reflectors. In each cabin a "Freezor" oscillating fan is installed and the dining saloon is ventilated by means of "Wing"-type deck-head fans. Special attention has been given to lighting so that cargo can be handled with the same dispatch at night as during the day. Cargo connection boards of a special pattern are provided, with "Neptune" lanterns and 500-watt gasfilled lamps, in addition to portable cargo lanterns accommodating 100-watt gasfilled lamps. A 7½-h.p. motor is installed in the workshop for driving the machine tools. In the pantry there is a 28-way bell indicator for the bell installation throughout the ship. The cable throughout is of Pirelli-General manufacture.

The Metallic Arc Welding of Cast Iron.

Particulars of the Technique to be followed.

By P. L. ROBERTS.

One of the most vexed and discussed subjects in the particular section of the engineering world concerned is the welding of cast iron. It is an exceedingly controversial subject, largely because the majority of engineers know little or nothing of the technicalities involved, and base their opinion entirely on their experience of the results. A great deal of indifferent and really bad welding has been done simply because the whole process has been entrusted to operators who have had no proper training and whose little knowledge is empirical. Then engineers, seeing only the poor results, condemn welding. This is just as sweeping as is the condemnation of electricity because one has had poor service from a particular type or make of electric motor! Research work combined with long and close observation of various methods of welding cast iron and the attendant results, have established the process on a firm basis of reliability. It is possible to state definitely beforehand, by visual examination, the possibility of successfully welding any particular iron casting. This, of course, requires the knowledge gained by intimate experience of such work.

Much has been written about the remarkable repairs effected by the metallic arc welding of cast iron, but little about the actual methods or technicalities involved. It is essential to have some knowledge of the physical properties of cast iron to appreciate the difficulties involved and the nature of the results obtained by welding. The chief difficulty in the welding of cast iron arises where expansion and contraction cannot take place freely, as cracking occurs due to the brittle nature of the metal. This brittleness, or entire lack of ductility, is well known as an inherent property of cast iron, and is caused by the large amount of free carbon, or graphite, in the metal. The graphite separates in flakes round the grain boundaries during and after the solidification of the cast metal, so causing separation in the iron. The tensile strength of cast iron, therefore, is only equal to the tensile strength of the "cement" formed by the graphite flakes between neighbouring crystals. The tensile strength, as a result, is low, as would be expected, and the ductility (stretching without fracture) practically nil. The natural consequence of this lack of ductility is that fracture will occur in or near a welded portion of cast iron in cooling, unless free to contract. For instance, assume a weld to have been made over a small area of a large piece of metal. The weld, in cooling from its molten to normal temperature, must contract. The weld has now become a part of the whole, but must contract independently of the whole, because heating has only been applied at the weld and not to the body of the metal. The result is that considerable stress is set up during cooling. If, however, the weld and welded part is steel or similarly *ductile* metal, it will stretch under the force of contraction, *without* fracture. In the case of cast iron, however, the force exerted due to contraction causes fracture of part or the whole of the portion which is cooling, because of the lack of ductility mentioned.

In practice the welded portion of a casting may be stronger than certain other parts, so that on cooling, the force of contraction will cause fracture at one or other of these parts. There are a number of ways of overcoming this, the greatest difficulty in the welding of cast iron, and they will be described later.

Another important effect on the cast iron due to the large amount of carbon present is that of chilling. The carbon content of cast iron varies from 3 to 4 per cent., which is all in solution, or combined with the iron, when the latter is molten. If the metal is cooled suddenly from that state, the carbon remains in the combined form, causing very considerable hardness of the metal. Such an iron is known as white iron, and cannot be machined in the usual way, grinding alone being effective. Slow cooling, or cooling in a temperate indoor atmosphere, from the molten stage to below a dull red temperature, will enable the carbon to separate from the iron, to form flakes of graphite as the cooling progresses. Slow and prolonged cooling will cause grain growth, and the larger the grain the weaker the iron. It is necessary, therefore, if the best results are to be obtained, to cool neither too quickly nor too slowly. The correct condition is realised when the metal is allowed to cool in air in a place free from draughts. Hence, after welding cast iron, the condition of cooling is arranged to meet as nearly as possible that indicated.

The methods of welding cast iron by the metallic arc may be divided into two classes: "The cast-iron electrode method" and "The mild steel electrode method."

The Cast-Iron Electrode Method.

In welding any metal it is always desirable that the weld should possess so far as is possible the same physical properties as the parent metal. In the particular case of cast iron, the physical properties of the weld can be made to correspond very closely with those of the casting. It is necessary, however, to preheat the whole or part of the casting before attempting to weld. The preheating is essential, when welding with a cast-iron electrode, to prevent cracking due to the contraction stresses set up, and to provide the means of slow cooling to ensure a grey iron weld, as previously indicated. The choice of whether a casting shall be partially or wholly preheated depends entirely on the position of the break and the type of casting. If the welded portion is perfectly free to contract on cooling, it is only necessary to preheat the casting across the broken section, simply to ensure that the deposited metal will not be chilled, resulting in a hard deposit. This is the simplest case, and the welding can always be made a successful piece of work. In cases where the welded portion is not free to contrast, preheating has also to serve the purpose of preventing contraction cracks. It will readily be seen that if the whole of the casting is heated, kept at a high temperature during welding, and then the weld allowed to cool slowly with the casting, no stresses will be set up, as contraction takes place uniformly throughout the whole mass. It is only necessary to heat the casting to a dull red (about 500 deg. C.) and maintain that temperature during welding, and to cool slowly in air practically to eliminate all contraction stresses.

The theoretical considerations having been dealt with, the practical aspect will now be discussed. First, the preparation and welding procedure must be decided. The casting must be prepared for welding by chipping, drilling, grinding, or otherwise opening the defective part so that it is completely accessible to the welding electrode. Where the defect is a crack, it must be opened by "veeing," that is, cutting a vee-shaped groove along the course of the crack to within $\frac{1}{8}$ in. of the bottom. In the case of a blowhole, drilling or chipping may be employed to open the defect so that all sand and carbonised metal may be removed, and every part made accessable to the electrode. Preheating is the next operation, and the method will have been decided when considering the possibility of welding. Total preheating, though the safest and the completely "fool-proof" method of preparing for welding, is avoided whenever possible, as it increases the cost of repair, and when large castings are concerned, radiates so much heat as to make the welding a very uncomfort-

able job for the operator, with the increased risk of scamped work. Local preheating about the weld, as pointed out before, may be used when the weld is free to contract. There is a third group of cases which may be successfully welded by partial preheating. If it is judged that the contraction stresses will be confined to one or two places, it will only be necessary to preheat at those points of stress to eliminate all danger of fracture during cooling. The application of partial preheating, to cases where the stresses set up are only local, saves considerable time and money and often makes welding possible on large castings which it would be impracticable to preheat. It is not possible to give any hard and fast rules governing partial preheating, and experience alone will give the ability to judge the position of contraction stresses.

The actual preheating is simple enough. If total preheating is to be used, the whole casting is raised from the ground and bricked in with *firebricks*, the top row being slightly higher than the top of the casting. The casting is so arranged that the portion to be welded is at the top and as accessible as possible. A loose cover of asbestos millboard should be used to cover the whole completely. The most convenient form of heating is a coal gas or paraffin blow pipe. A hole should be left in the brickwork for the insertion of the blow pipe nozzle. If the casting is small or hollow, a single blow pipe will suffice, the flame in the latter case being directed inside. Otherwise a sufficient number of blow pipes should be used to obtain *uniform* heating of the work. Alternatively, coke or charcoal may be used for heating purposes, but such solid fuel is dirty, gives off dangerous fumes, and is generally inconvenient.

If partial or local preheating is employed, each part to be preheated is built in by fire-bricks, leaving spaces for the insertion of the blow pipe or air-blast nozzles if solid fuel is used. The general rules already given regarding preheating hold good in the above cases.

When the casting is at a red temperature, the amount of heat supplied is reduced considerably, but the casting is not allowed to drop below a dull red temperature during the welding. The cover, or a portion of the cover, is removed and welding commenced. There are a number of electrodes on the market for *depositing* cast iron, but the most satisfactory results are obtained by using any ordinary high-silicon (3 to 5 per cent.) cast-iron rod as used for oxy-acetylene welding. A flux is not used in this case. A moderately high current is used, varying according to the thickness of the work. The electrode is deposited in the usual way, and the welding is made as continuous as possible to conserve heat. When the weld is completed, the cover is replaced, the heating flames removed (or the fire allowed to die out), and the casting allowed to cool normally. The weld is a soft, fine-grain grey iron, and is readily finished by filing or machining.

The Mild-Steel Electrode Method.

It is often undesirable, or even impracticable, to preheat castings—even partially—and so the work has to be welded cold. This calls for considerable skill, both in deciding the best procedure and in completing the actual weld. The reason for this will be apparent from what has already been said regarding the extremely brittle nature of cast iron. Each globule of metal is chilled by the cold casting as it is deposited from the electrode, and the contraction in the weld is sudden, leaving a residual stress in the metal, which readily results in fracture in or near the weld. The sudden chilling also causes hardness of the deposited metal. The simpler cases where the weld is free to contract will not be considered here; in fact, they are generally welded with a cast-iron electrode. All other cases are considered very carefully beforehand to decide the best method of welding procedure to avoid fracture due to contraction. Local contraction in the weld cannot be prevented, because it is an inherent effect, and preheating is not employed to make it uniform throughout the casting. Therefore, the endeavour is always to prevent the contraction stresses resulting in *fracture*. As pointed out previously, if local contraction takes place in a ductile metal, it will stretch without fracture. This fact is made use of in the welding of cast iron, and the mild steel electrode is employed to utilise this effect. When a mild steel electrode is fused with cast iron, a considerable amount of the carbon present passes into solution in the deposited metal. The result is a kind of carbon steel which is always more or less blown, due to carbon monoxide being given off and trapped during the solidification. A second layer of metal deposited on the first will contain very much less carbon, because a part of the carbon that the first layer contains will be uniformly re-distributed throughout the re-fused portion of the first and the whole of the second layer. In this way each succeeding layer will contain less carbon than its predecessor. The third or fourth layers are for all practical purposes mild steel. The surfaces of the parts to be welded are "coated" carefully with three or four layers of mild steel before any attempt is made to weld them together. Then the parts are welded together, and the deposited metal remaining a mild steel, stretches without fracture under the force of contraction. Such welding procedure necessitates special preparation of the defect beforehand. Cracks are veed out with a space of an inch between the edges to allow three or four layers to be built up along both sides of the vee without meeting in the centre. Cracks which only extend part-way into the casting are drilled at the end to prevent spreading. Blowholes are opened up in the usual way.

Welding is commenced at any point, using only sufficient current to obtain fusion of the electrode with the cast iron. Each run is short, not more than 2 in. in length, to prevent contraction in the weld metal causing local fracture at the fusion line with the cast iron. After making two or three runs, welding is commenced at another point further along the crack, and this method of progression continued, returning to the starting point eventually and repeating the cycle of welds until the sides of the vee are covered with one layer of weld metal. The second layer is then commenced. The casting is never allowed to reach a temperature above 50 deg. C. Even using the method of alternative positions, it is necessary to allow the casting to cool periodically before proceeding with the welding. The welding is carried on in the same way until the third or fourth layer has been deposited, when the edges of the vee are nearly touching; then the two sides of the crack may be fused together by welding down the centre, in alternative position as before. The deposited metal is stronger than the cast iron, but the absorption of carbon from the cast iron which has been fused with the electrode causes a line of weakness, along which fracture will take place if excessive stress is subsequently put on the casting. Although the general mechanical properties of this zone are inferior to those of the cast iron, such a weld will serve very satisfactorily for the majority of cases. Though the case of a crack was instanced above, the principle is the same for a blow-hole.

If the casting is part of a machine subject to considerable working stresses, such as a press frame, it is desirable to obviate the weak zone caused by absorption of the carbon. This end is accomplished by the use of studs. The break is prepared by veeing as before—though the gap between the edges of the vee is unnecessary—and the sides of the vee are drilled and tapped for steel studs. The size of the studs varies from $\frac{3}{8}$ in. to $\frac{5}{8}$ in., according to the thickness of the casting, and they are placed at intervals. After the studs have been screwed into the holes, welding is commenced by making a single run round each stud, fusing the stud and the cast iron. Welding round each stud in successively larger circles is carried on until the circles meet and the gaps between are filled. Further layers are built on top until the vee has been completely welded. Any stress that may arise due to contraction of the weld, or subsequent working conditions, is chiefly transferred through the studs to the cast iron right outside the welded area, which consequently has been unaffected in its physical properties by the welding. The weld, and

the area around the weld, is stronger than the cast iron itself, and so gives the full service which may be required of it.

The choice of the most suitable of the described methods of welding for a particular case is decided primarily according to whether the casting belongs to the class in which the weld is free to contract, or the rigid type. If the former, either the cast iron or the mild steel electrode may be used without having to do more than locally preheat in the former case or take any of the special precautions in the second. Great care is necessary, however, if the casting belongs to the "rigid" class. If small, the casting is preheated and difficulties due to contraction are eliminated, combined with the advantage of a grey cast-iron weld. When the casting is large, it may be impracticable to preheat, or uneconomical. It may be possible to overcome contraction stresses, however, by partial preheating at the areas where the stress will be set up. Then either the cast iron or the mild steel electrode may be used according to the kind of weld metal desired. Should the casting be complicated, and any of the foregoing methods impossible, one resorts to the mild-steel electrode method, employing the gap between the edges of the vee as described. If done carefully, welding by this method is invariably successful. As a special precaution, studs may be used as explained.

By the judicious use of one or other of these methods, and by close observation of the effects, much skill has been gained in the successful repair of all classes of the most complicated castings. Long service under conditions of high working stresses has proved that the application of the process of arc welding to such repairs is not only fully justified, but saves a very considerable amount of money in replacements. The time saved in obtaining and refitting replacement parts is often of greater consideration. Now that systematic research work has established the process on a scientific basis, and it is becoming thoroughly known, engineers generally will accept welding without doubts as to its reliability. Then the process will come into well-merited prominence.

Business Notes.

Commercial and Industrial Developments, Business Changes, Trade Opportunities, New Publicity Literature, Liquidations and Failures.

Information for Shareholders.—WHITEHALL ELECTRIC INVESTMENTS, LTD., has issued a handsome brochure with the object of giving information to its share and debenture holders as to the various electrical undertakings in which the company's capital has been invested. The publication is profusely illustrated with views of the power stations, &c., in South America operated by the company's Latin-American subsidiaries. Particulars are given of the improvements which have recently been carried out, and the capacity and output of the supply undertakings. The latter have a total capacity of 122,000 kW, and the output in 1925 approached 300 million kWh.

Wiring Old Houses.—During the last decade or so the Northern States Power Co. has carried on a "campaign" for the wiring of old houses in Minneapolis. The result has been to bring the number to near "saturation point." In this city of between three and four hundred thousand inhabitants there were 52,000 unwired houses in 1914; by the end of 1924 only 6,000 remained unwired, and the campaign is being continued. The *Electrical World* says that the effect of the company's efforts is seen in the decreasing proportion of old houses wired in the number of new lighting customers. In 1922 the old houses wired accounted for 63 per cent. of the total, whereas in 1924 only 47 per cent. of new lighting customers were represented by old houses wired.

A Great Charitable Effort.—During the year which has just ended the employés of Messrs. A. Reyrolle & Co., Ltd., subscribed over £1,130 for hospitals and charities. The Employés' Hospital and Charities Committee has allocated this amount to 21 institutions and funds. The Newcastle Royal Victoria Infirmary and the Hebburn Infirmary receive £325 each and £100 is allotted to the Employés' Benevolent Fund.

Tyneside Developments.—On January 5th, Mr. H. W. Clothier presided at a meeting of the Electrical Section of Newcastle Chamber of Commerce when it was decided to strengthen the committee in view of the developments which may take place as a result of the effort being made to attract new industries. It is intended to obtain information as to the general costs of starting works on Tyneside, as compared with the costs experienced in other districts.

British Rails for British Railways.—The London and North-Eastern Railway has announced that in future it intends to specify that all rails supplied to it must not only be of British manufactured steel but must also be made from steel of British manufacture throughout. The other railway groups state that they already make this proviso in their contracts, the Southern Railway, indeed, insisting upon British goods for all its contracts.

British steel rails have made good showing in Japan. According to a recent statement by Sir William Larke, director of the National Federation of Iron and Steel Manufacturers, an investigation into the history of rails which had been in service for 54 years proved that after 40 years of service British rails showed no signs of breakage. Although American, Belgian, German, Russian and Japanese rails had lives of from 10 to 40 years, only a small quantity reached the latter figure.

"Underfeed" Contracts.—Among the more important orders recently received by the Underfeed Stoker Co., Ltd., for power station equipment are the following:—London Electric Supply Corporation, Ltd., air heaters and two Detrick arches; Nottingham Corporation (North Wilford station) six self-contained stokers; Central Electric Supply Co., two Detrick arches and four self-contained stokers; and Poplar Borough Council, ash and coal conveying plant.

Swiss Water Power Exhibition.—An International Exhibition of Inland Water Transport and the Utilisation of Hydraulic Power is to be held at Basle from July 1st to September 15th. During the period of the exhibition (from August 31st to September 12th) the first sectional meeting of the World Power Conference will be held in the city.

The Home Market.—Speaking at a recent luncheon at Nottingham, Sir Philip Cunliffe-Lister, President of the Board of Trade, said that the home market had of recent years assumed greater importance. It was our greatest market, and the more it could be developed the better our trade balance would be, providing more money for new markets abroad. Sir Philip said that the growing recognition of the value of Imperial trading relations was a hopeful sign for the future.

Electrical Trades Commercial Travellers' Association.—The social evening arranged for Friday, January 15th, has been postponed until Friday, the 22nd.

British Enterprise in South America.—In the course of a note on the British Industries Fair, the *Review of the River Plate* says:—"The publicity which has been given in Argentina to the forthcoming exhibition is a most excellent sign. It shows that manufacturers at home are acting in a fuller consciousness of their responsibilities to their emissaries in this part of the world and that merchants and representatives here will be able, in the future, to count upon the practical help and support they need, but which has not always been theirs in the past. This awakening of British manufacturers and traders to a sense of what is needed of them in the way of livelier enterprise and more wide-awake initiative is progressing satisfactorily. Numerous publications in the Spanish language giving valuable information regarding British industrial aims and developments show that Britain is waking up in many ways. Once the awakening process has been completed, we may be sure that the resultant and welcome trade push will be such as will take all minor obstacles in its stride."

A Holophane Staff Conference.—A half-yearly conference of the indoor and outdoor staff of Holophane, Ltd., was held on December 29th and 30th. In addition to the various matters discussed by the staff, the conference had the benefit of hearing interesting and instructive papers read by gentlemen prominent in the illuminating engineering movement who are not connected with the firm. Amongst these were Mr. Leon Gaster (secretary of the Illuminating Engineering Society) who gave a review of illuminating engineering progress during 1925; Mr. L. L. Robinson (Borough Electrical Engineer of Hackney), who dealt with "Street Lighting"; Mr. W. E. Bush (of E.L.M.A.) on "The Policy of E.L.M.A. Lighting Service Bureau"; Mr. W. J. Jones (of E.L.M.A.) on "Shop Window Lighting"; and Mr. Dudley Diggs (of the Street Lighting Department, International General Electric Co., of Schenectady, U.S.A.) on "Some International Aspects of Street Lighting."

Belgian Import Regulations.—The *Board of Trade Journal* for January 7th contains a list of goods for which certificates of origin are required upon importation into Belgium. The list includes tubes and pipes of iron, steel or cast iron; cable-making machinery, complete; dynamo-electric machines; electric accumulators and plates; submarine and land cables; electric and electrotechnical apparatus and parts; articles for electrical purposes of porcelain, faience, terra-cotta, stoneware or glass with metal parts; and insulating parts of asbestos, mica, micanite, rubber, ebonite, and other materials.

Local Exhibition.—MOTHERWELL.—At a recent exhibition of electrical cooking appliances the Credenda Conduit Co., Birmingham, displayed the "Creda" cooker, with which demonstrations were given by Mrs. Mole, M.C.A. (gold medallist). Other exhibits were made by the General Electric Co., Ltd., and Carron Co., while the tea-room lights were by the British Thomson-Houston Co., Ltd. An exhibit of model lighting was given by the Glasgow Lighting Service Bureau. In the radio section the General Electric Co., Ltd., and the British Thomson-Houston Co., Ltd., were represented. Lady Belhaven, president of the Scottish Electrical Association of Women, visited the exhibition, and spoke of the great saving effected by electric cookers and fires.

Meter Approved. — The Electricity Commissioners have approved of the construction, pattern, and method of fixing the meter known as the Chamberlain & Hookham single-phase watt-hour meter, Type "A1," rated from and including 5 amps to 20 amps., 200 V, at a frequency of 50 cycles.

An English Offer to Costa Rica.—*Commerce Reports* states that an English manufacturer of hydro-electric equipment has offered to install all the necessary plant for the recently-formed Cia. Nacional Hidro-electrica, Costa Rica, for about $375,000, the payments to be made over a period of five years following the installation and operation of the plant.

On the Ability to Sell Goods.—An address entitled "Notes on Salesmanship" was delivered to the Junior Institution of Engineers on Friday last by Mr. A. J. Simpson, the chairman. He summarised the qualities required in a salesman or representative as optimism, patience, tact, individuality, judgment of human nature, knowledge of things in general, and method, and he then described the nature of the work that a salesman had to do and the parts all those qualities played in it. Mr. Simpson invited discussion of his remarks, and a large number of members expressed their views. Mr. J. S. Highfield, who presided, said that he agreed with Mr. Simpson that it was generally desirable that salesmen should know how the articles they were selling were made; there were sometimes objections, and he gave examples of when it was desirable and when otherwise. Messrs. Rentell, A. E. Knight, and E. North spoke about means for securing the interest of buyers. Mr. F. E. Murrell said that he was now in England for the purpose of arranging a contract because representatives abroad had not sufficient technical knowledge to deal with the contemplated order. In distant lands a knowledge of things in general was very important indeed; an agent who could retail the latest information would never have his name forgotten. Mr. H. R. Williams and many other members contributed to the discussion. Some of their points may have seemed to be only small ones, but they were useful for intending or persevering salesmen.

Employés' Representative on J.E.A.—The Minister of Labour announces that he will shortly notify the Electricity Commissioners of the employés' organisations having members in the employment of the authorised undertakings composing the West Midlands Electricity District in order that these organisations may choose a representative. The unions concerned must make application to the Minister of Labour, on a special form, by January 23rd.

Trade Announcements. — MESSRS. BURWOOD (CONCESSIONAIRES) LTD., of 41, Great Queen Street, Kingsway, London, W.C.2, wish the trade to know that their letter-box was broken open on the morning of January 5th and all correspondence stolen. They would appreciate copies of letters due for delivery on that morning.

MR. J. H. GREENWOOD, of 21, Weston Lane, Otley, Yorkshire, asks for copies of trade circulars and catalogues for the use of students.

MESSRS. SIDNEY G. JONES, LTD., of Victoria Street, S.W., have removed to 1-3, Brixton Road, Kennington, London, S.W.9.

MESSRS. J. & E. HALL, LTD., of Dartford, have acquired a controlling interest in Medway's Safety Lift Co., Ltd., and are taking an active part in the management. The lifts will be manufactured at Dartford, where extended facilities are available, and special attention will be devoted to the maintenance department.

MESSRS. ALLEN-LIVERSIDGE, LTD., have just registered a company in Bombay under the name of Allen-Liversidge (India), Ltd., for the purpose of carrying on, in India, their business of dissolved acetylene manufacturers, carbide merchants, and lighting and heating engineers.

MESSRS. TAYLOR & PETTERS, LTD., mica merchants, have removed from Hatton Garden to 3-11, Westmoreland Place, City Road, London, N.1. New 'phone number:—"Clerkenwell 4105."

MR. GEORGE E. WHITEHEAD, who for some years has represented Messrs. Ferguson, Pailin & Co., Ltd., and the Lancashire Dynamo & Motor Co., in South Wales and the Western Counties, has severed his connection with these companies and has commenced on his own account at 102, St. Mary Street, Cardiff, as engineers' agent, having secured agencies for Messrs. Erskine Heap & Co., Ltd., and Edison Accumulators, Ltd.

THE MANCHESTER DISTRICT WIRELESS CO., of 21, Agur Street, Bury, Lancs., whose premises were damaged by fire on January 5th, has secured temporary accommodation at 14, Union Street.

Catalogues and Lists.—MESSRS. P. L. DWYER & Co., 30, Grosvenor Place, S.W.1.—January price list of electrical materials and accessories.

MESSRS. L. G. HAWKINS & Co., LTD., 30-35, Drury Lane, W.C.2.—An illustrated pamphlet for the trade announcing details of the "Universal" electric cleaner, electric ironer, washing machine, and other domestic appliances.

THE ATHOL ENGINEERING CO., Cornet Street, Higher Broughton, Manchester.—An illustrated pamphlet advertising a number of radio components—coil holders, earthing plugs, valve holders, &c.

BRITISH INSULATED CABLES, LTD., Prescot, Lancashire.—A well-produced catalogue of mining cables and accessories, containing particulars and illustrations of v.b., paper, and v.i.r. cables, joint boxes, cable racks, cable winches, switch-fuses, insulators, compounds, &c.

THE GENERAL ELECTRIC CO., LTD., Magnet House, Kingsway, W.C.2.—A mailing card drawing attention to the company's radio sets, valves, wall plugs, and lampholders. Also Leaflet F.3,974, containing illustrations and prices of "Gecoray" shop-window lighting reflectors.

THE DE LAVAL CHADBURN CO., LTD., Wellington House, Buckingham Gate, S.W.1.—A booklet entitled "The Purification of Insulating Oils," containing details of the construction and operation of the company's centrifugal machines, and notes on the determination of the dielectric strength of insulating oils.

THE WHOLESALE FITTINGS CO., LTD., 23, 25 & 27, Commercial Street, E.1.—A pamphlet, illustrated in colour, giving prices of "Silchrome" glass shades with burned-in designs.

MR. HENRY JOSEPH, 96, Victoria Street, S.W.1.—A pamphlet illustrating radio cabinets made by Messrs. W. & T. Lock, Bath. Fully priced.

THE SUN ELECTRICAL CO., LTD., 118-120, Charing Cross Road, W.C.2.—Illustrated and priced booklets dealing, respectively, with display lighting equipment and domestic electrical appliances. Also a leaflet advertising "Memrex" ironclad switchgear.

MESSRS. J. & W. B. SMITH, LTD., 15-23, Farringdon Road, E.C.1.—An illustrated price list of "Redot" electric fires and domestic appliances; a booklet dealing with electric lighting for the home; and a pocket price list of electrical accessories.

MESSRS. E. BROOK, LTD., Empress Works, Huddersfield.—A folder containing prices of two- and three-phase protected squirrel-cage motors up to 16 h.p., and air-break starters.

Bankruptcy Proceedings.—W. A. A. C. ROBINSON, electrical engineer, 10, Carnaby Street, Golden Square, W.C.—Bankrupt's discharge suspended for two years until November 24th, 1927.

J. ADDY, lately wireless and cycle dealer, Bridge End, Long Preston.—Last day for proofs for dividend, January 19th. Trustee, Mr. J. O. Morris, Official Receiver, 12, Duke Street, Bradford.

A. H. MONCRIEFF, wireless manufacturer, late of 197, Anerley Road, S.E.20, and 60, Thornton Road, Bradford.—Last day for proofs for dividend January 19th. Trustee, Mr. J. O. Morris, Official Receiver, 12, Duke Street, Bradford.

T. A. WICKHAM, electrical engineer, Snaresbrook, Station Road, New Milton, Southampton.—Last day for proofs for dividend, January 20th. Trustee, Mr. H. Ashton, Official Receiver, Bank Chambers, High Street, Southampton.

A. F. WEBB, electrician, 102, Duke Street, St. Helens, Lancs.—Receiving order made January 6th on debtor's own petition.

A. C. STUART and C. PERRIER (Stuart Wireless Telephone Co.), 109, Kingsway, W.C.—Trustee, Mr. D. Williams, Official Receiver, Carey Street, W.C., released December 31st.

M. D. ROSENBLOOM (D. Rose & Co.), electrical engineer, 25, Osborn Street, E.—First and final dividend of 1s. 1d. in the £ payable January 20th at Messrs. Poppleton, Appleby and Hawkins, 4, Charterhouse Square, E.C.

JOHN BRODIE, electrical engineer, 59, High Street, Dunfermline.—This debtor was examined on January 7th. He admitted liabilities of £456, with assets amounting to £231, and said that he started business with a capital of £60. He attributed his bankruptcy to the loss of over £200 on a large contract.

Company Liquidations.—HOLOPHANE, LTD.—Winding up voluntarily for reconstruction purposes. (See ELEC. REV., January 1st, p. 15.) Liquidator, Mr. J. W. Ife, 122, Manor Waye, Uxbridge, who is authorised to consent to the registration of a new company to be named Holophane, Ltd. Meeting of creditors at Elverton Street, Vincent Square, S.W., January 15th. (This notice is purely formal, as all creditors have been or will be paid in full.)

CLEVELAND ELECTRICAL ENGINEERING CO.—Particulars of claims to Mr. M. McGilligan, 29, Grange Road, Middlesbrough, liquidator, by January 26th.

SOUTH-EASTERN AND CHATHAM CONSTRUCTION AND POWER CO., LTD.—A meeting of members is called for February 10th at the offices of the Southern Railway Co., Waterloo Station, to hear an account of the winding up from the liquidator, Mr. R. D. Heckels.

RE-ECHO ELECTRICAL MANUFACTURING CO., LTD.—Liquidator, Mr. G. D. Pepys, Official Receiver and Liquidator, Carey Street, released January 6th.

American Boiler Company's Purchases.—The *Financial Times* reports that the Babcock & Wilcox Co., of America, has purchased the Fuller-Lehigh Company and its subsidiaries, manufacturers of pulverised fuel and cement mill equipment; also the Bailey Meter Company, manufacturers of meters and recorders, combustion-control equipment, pulverised fuel plant, and water-cooled furnace walls.

Charge of Obtaining Goods by False Pretences.—At Old Street Police Court, on Tuesday, Charles Fredk. Kidby, 29, gramophone dealer, of 4, Roslyn House, Rushcroft Road, Brixton, and Alfred Sidney Taylor, 42, engineer's fitter, of 77, Carysfort Road, Stoke Newington, were charged on remand from January 4th with being concerned together in knowingly obtaining by false pretences a quantity of wireless goods, value £44 8s. 4d., from Ernest Edward Rooke, with intent to cheat and defraud, at City Road, E.C. Mr. Clayton prosecuted for the Director of Public Prosecutions, and, in opening the case, said that there would be further charges of obtaining goods by false pretences and also charges of conspiring to defraud. The two men had been trading as a company, C. F. Kidby, Ltd., from January, 1924. Premises were taken in City Road, and according to their bill heading they were wireless set manufacturers, cycle and gramophone manufacturers and importers, and apart from that they seemed to have dabbled in all sorts of things. There was no doubt about it that before the formation of the company the business seemed to have been paying its way, but it was suggested by the prosecution that from October, 1924, to June, 1925, the business was nothing but a fraudulent one. So far there were 110 complaints, and the total amount was about £3,000 in varying sums.

Mr. James Crewys, director of the Power Equipment Co., electrical engineers, Hendon, said that on December 9th, 1924, he received a letter from Kidby, Ltd., signed "A. Taylor, director." They replied and sent on a sample transformer. On December 18th a letter was received acknowledging receipt and enclosing an order for 50 transformers, the approximate value being £20. On January 7th they received another order for 50 transformers, value £22 18s. 6d. They had not been paid in respect of those orders.

Mr. Ernest Edward Rooke, proprietor of Rooke Brothers, wireless component manufacturers, W.C.1, said that on January 17th they received an order for wireless components, value £20 11s., and on February 3rd a similar order to the value of £23 8s. They had not been paid.

A further remand was ordered, defendants being admitted to bail in one surety in £250 each.

Copper Prices.—Messrs. F. Smith & Co. report January 12th:—No change in the prices of electrolytic copper.

Messrs. James & Shakespeare report January 12th:—Copper bars (best selected), sheet and rod, no change; English pig lead, £36 10s., 10s. decrease.

Messrs. Edward Till & Co. report January 12th:—India-rubber, Para fine, 3s. 6d., 4d. decrease.

Dissolution of Partnership.—MARLEY & WHITE, radio engineers, agents and merchants, 17, Sand Hill, Newcastle-on-Tyne.

Receivers Appointed.—COLE, MARCHENT & MORLEY, LTD., Bradford.—On behalf of the debenture-holders Mr. Alfred Greaves (F. H. Lee & Greaves, chartered accountants, 35, Bank Street, Bradford) and Mr. R. S. Brailsford have been appointed joint receivers. The announcement was made public on January 6th. The object of the appointment, it is stated to inquirers, is primarily for protection of the debenture-holders, but it is also hoped that it will enable the business to be continued as a going concern and without stoppage, whilst meanwhile it is hoped to find a solution of the difficulties arising out of the long period of bad trade during the past several years' slump. The business of Cole, Marchent and Morley, Ltd., has been established about 70 years, and employs normally between 300 and 400 workpeople. Our Bradford correspondent writes:—"At present the undertaking is fairly busy and the report on the past year's trading was one of the most bright in the rather doleful reports generally of engineering conditions in Bradford during 1925. During the past year orders completed by the company included a large twin condensing plant for the recently-inaugurated 20,000-kW turbo-generator at the Valley Road station of the Bradford Corporation Electricity Department and a somewhat similar order for the Leeds Corporation. The concern has nearing completion an order for two condensing plants for 15,000-kW turbo-generators for an electrical power station in the Midlands, and during the year it has been engaged on, or is still working on, condensing plants for Cardiff, Swansea, and Oxford."

Calendars, Diaries, &c.—A literary calendar has been received from BULL MOTORS, LTD., Ipswich. This has a block of slips with a quotation from Shakespeare for every day.

A neat calendar has been issued by the SOLENOID REGULATOR Co., 268, Moseley Road, Birmingham, consisting of a purple and gold case containing monthly date cards.

From MESSRS. W. W. SPRAGUE & Co., LTD., lithographers, of Bread Street Hill, Queen Victoria Street, London, we have received copies of their wall calendar, and blotting pads with memoranda slips, calendar, &c.

The D.P. BATTERY Co., LTD., of Bakewell, Derbyshire, once again dispels our London gloom with a beautiful piece of local scenery ("The Valley of the Dove, near Crowdicotes, Derbyshire") on its wall calendar for 1926.

MESSRS. HENRY WIGGIN & Co., LTD., Victoria Station House, Victoria Street, London, S.W., have sent us an excellent vest pocket diary which is unquestionably "one of the best."

MESSRS. W. G. BEAUMONT & SON, painters and contractors, of Priory Works, Bow, E.3, have sent us a copy of their annual year book and desk diary, and a calendar with a humorous picture by Lawson Wood.

Lead.—Reporting on January 9th, Messrs. James Forster and Co. stated:—"There is still little active buying by consumers, and it is really remarkable under these circumstances that the price has held up so well in view of the recent heavy arrivals. With these out of the way and a revival in demand from the trade, we might quite see a further recovery in values."

Social Events.—The second annual carnival of the A.T.M. Sports and Social Club (Automatic Telephone Mfg. Co., Ltd.) was held on December 29th, at the Grafton Rooms, Liverpool. It proved a very successful event, about 800

Prizewinners at an A.T.M. Carnival.

attending, and many original and attractive costumes were in evidence. We reproduce herewith a photograph of the prize-winners.

The annual staff dance and whist drive of the Clydesdale Supply Co., Ltd., Glasgow, was held on January 5th. Mr. A. Levine, managing director, and a representative gathering attended.

The annual staff dinner of Messrs. Francis Polden & Co., Ltd., took place on January 9th, at Anderton's Hotel, Fleet Street. The chairman (Mr. E. C. Polden) presided, and was supported by Mrs. Polden and a number of guests. Mr. F. J. Baker, in proposing the toast of "The Chairman and Company," expressed the appreciation of the staff of the efforts of the company. Mr. Polden replied, and later proposed the toast of "The Staff," and thanked them for their endeavours to maintain the work at a high standard. A musical programme was given by "The Merry Dominoes."

On January 2nd, the Sales Department of Standard Telephones and Cables, Ltd. (formerly Western Electric Co., Ltd.), held its second annual companionship dinner and dance at the Connaught Rooms. About 120 people were present, including representatives of the engineering, manufacturing, and other departments. Mr. H. C. Trenain, general sales manager, presided, and a thoroughly enjoyable and successful evening was spent.

Brazilian Concessions to Rubber Factories.—In an effort to encourage the establishment of rubber factories in Brazil, the Government is offering special privileges to manufacturers. Among the concessions to factories for the manufacture of rubber articles which may be established in Brazil during the next three years, and those already established which increase their plants during the same period, is exemption from import duties and bureau charges during a period of 25 years for machinery, tools, and material necessary for the installation and extension of the factories or plants, chemical substances, various textile materials, combustibles and lubricants, indispensable to the working of the factories or plants. The exemption conceded on machinery, utensils and tools is retroactive, being applicable to such articles imported after January 5th, 1921.—*Reuter's Trade Service* (Washington).

The Shannon Scheme Dispute.—While the wages dispute in connection with the Shannon hydro-electric scheme cannot be said to have reached a definite settlement, the contractors, Messrs. Siemens-Schuckert, Ltd., have offered unskilled workers an advance in the rate from 32s. to 35s. 6d. per week, and more men are now being employed, with the result that a considerable amount of work is proceeding. The general feeling is that the strike will collapse. There is a marked increase in the opposition to the Labour Party's attempt to boycott the work by withholding labour.

German Radio Exhibition.—Under the auspices of the German Messe Amt and the German Association of Radio Dealers, a radio exhibition is to be held in Deutz-Cologne from January 30th to February 7th next. It is stated, however, that the Central Association of German Electrical Firms and the Union of German Radio Manufacturers have decided that the present financial position of the industry in particular, and Germany in general, is such as to render official recognition of the exhibition undesirable. The members of the two bodies have consequently been notified that they must not take part in the display.

For Sale.—The Director of Army Contracts invites offers for one 150-kW rotary converter, with starter and starting and distribution panels. Blackpool Corporation Electricity Department has for disposal one Browett, Lindley triple-expansion type engine, coupled to a British Westinghouse generator. Mr. H. J. Shaw will sell by auction on January 20th, at 13, High Holborn, W.C., the stock of an electrical and wireless goods factor and the stock of an electrical motor lamp and cable manufacturer. Bexhill Corporation Electricity Committee has for disposal two 500-kW Belliss-Dick, Kerr and Westinghouse d.c. generating sets, with field rheostats and circuit-breaker panels. Edinburgh Corporation Electricity Supply Department invites offers for two B. & W. boilers, with chain stokers and economisers, three Lancashire boilers, and two 330-kW Howden-Crompton 460-V, d.c. generating sets. Wembley Amusements, Ltd., invite offers for surplus electrical equipment. (See our advertisement pages to-day.)

The New Zealand Electric Federation.—Our New Zealand correspondent says that electrical utility services in New Zealand have grown to such a degree of popularity that the recently-formed Electric Federation is considered to be a move in the right direction, calculated to restore public confidence in the conduct of the trade generally, a confidence which showed a tendency to waver as the result of many anomalies which previously existed. As a first move the Federation sent its president overseas to study electrical matters in Canada and the United States, and as a result of the data thus obtained it is intended to develop the Federation's policy in New Zealand. New Zealand electrical houses have much to learn from America in the matter of merchandising electrical goods, as well as with regard to methods for popularising electrical utilities, but before definite selling and advertising campaigns are undertaken, it will be necessary to put New Zealand's house in order in other directions. The Federation is alive to this necessity, and is now concentrating upon the standardisation of materials and the securing of uniformity in the regulations governing electrical installations. At the present time some conflict of methods exists among the various Power Boards and others interested in distribution, and the Government is bringing in a measure to secure the licensing of all wiremen. The Government, as previously reported, is also considering the matter of establishing an Electric Standards Board with a view to testing and standardising all electrical material coming into the country. A conference of the Power Boards, the Government, the traders, and the Federation is being held shortly, when some matters of importance will be discussed.

Burnley and the Sale of Appliances.—At a recent meeting of the Burnley Town Council, Alderman Nuttall moved the reference back of minutes dealing with the sale of electrical appliances for cash or hire purchase. Councillor Parkinson inquired whether at the proposed electrical exhibition the Corporation would sell appliances at prices lower than those of private contractors, and whether it was wise to charge for admission to the exhibition. Alderman Nuttall replied that appliances sold by the Corporation would bear the same price as those of contractors in the town. It was necessary to have some charge for admission, but ten thousand free tickets would be issued to suitable people. Councillor Proctor said that if the Corporation could sell appliances cheaper than private firms it ought to be proud of doing so, and it would be to the advantage of the public. Councillor Whittaker asked if the price charged by the Corporation would include distribution, cost of fixing, &c. Alderman Nuttall said he was not sure that it was in the best interests to answer these questions. Their policy would be to sell at the same price as contractors, both at the exhibition and afterwards.

A Report upon North Africa.—A composite report upon the economic and commercial conditions in North Africa has been issued by the Department of Overseas Trade (Stationery Office, 3s. net). The principal feature of this is that it shows the predominance of French influence, and in the case of Cyrenaica, of Italian interests. Among the matters touched upon in the report is the electrification of the normal-gauge railway system in Morocco. The bulk of the material for this is being received from France. The line from Casablanca to Fez is the first line being electrified. The power station in the former place was completed at the end of 1924, and in May, 1925, it was linked up with a transformer station to supply Rabat and Salé. An automatic telephone exchange is approaching completion at Rabat. From a list of imports during 1924 it is seen that, of a total value of 1,149,000 fr. of dynamos imported, France was responsible for 1,145,000 fr. In the Tangier Zone there was a decrease in the quantity of machinery (unspecified) imported, but the French share was considerably greater. Interest in radio is being manifested in Algeria, but the use of British apparatus is generally precluded by the low exchange value of the franc. This factor also militates against the importation of other classes of British goods, although during 1923 British machinery to the value of 6,303,000 fr. was imported. In the section dealing with Tunisia, mention is made of the Cie. des Tramways de Tunis, which supplies electricity and runs an electric tramway and railway. In 1924 the company earned a gross profit of 1,208,077 fr. upon its capital of 12 million fr., paying a dividend of 6.5 per cent. net.

Explosion at Rubber Works.—An explosion occurred last Saturday in the power station of the Leyland and Birmingham Rubber Works. It is stated that damage to the extent of £6,000 was caused, the building being completely wrecked.

Book Notices.—"The *Mechanical World* Electrical Pocket Book, 1926." Pp. 401; figs. 130. Manchester: Emmott & Co., Ltd. Price 1s. 6d. net.—As usual, this work treats the many phases of electrical engineering in a manner rendering it a useful book of reference to the practical engineer, wireman, &c. Several new features are to be found in this edition; an additional chapter deals with magnetic chucks and clutches, while a variety of new methods has been included in the chapter on jointing conductors. New material is furnished on electro-chemistry, and other new sections include industrial electric heating, cutting by the electric arc, and electric lifts, cranes, &c. The diary and memoranda for the year in question are included as usual.

"O'Connell's Coal and Iron Diary and Manual, 1926." (Pp. 508, diary and memoranda pages.) London: Harper and Co. Price 10s. 6d. (subscribers 5s.), post free.—In addition to being a useful general handbook and diary, this publication is a complete guide to the coal industry of Great Britain. The directory section contains exhaustive lists of collieries, coal owners, factors, and exporters, and the type of coal produced by British coal owners. The Coal Mines Act is reproduced, and so are the regulations governing the use of electricity in mines, the Explosives Act, 1875, and other legislative measures. The volume closes with a classified trades' directory in which electrical firms have a good showing.

"The Practical Electrician's Pocket Book, 1926." By H. T. Crewe, M.I.Mech.E. Pp. xci+585; illustrated. London: S. Rentell & Co., Ltd. Price 3s. net.—This is the 28th edition of this publication. It has been revised, and much of the matter dealing with elementary principles has been re-written. New chapters on power factor correction, fault localisation on underground cables, and automatic protective gear have been included in this edition, and the central station tables have been brought up to date.

Foreign Machinery in Japan.—Japan's dependence upon foreign countries for her electrical equipment is illustrated by recent statistics showing the amount of plant installed in the country and the proportions of it made by foreign and Japanese firms respectively. For instance, the total capacity of installed water turbines is given as 1,143,800 h.p., and of this 960,800 h.p., or 84 per cent. has come from abroad. As regards other plant, Japanese manufacturers have only supplied 14 per cent. of the 450,250 kW of steam turbines installed; 17 per cent. of the hydro-electric generator capacity of 819,544 kW; 12 per cent. of the steam-driven generators (472,500 kW); and 20 per cent. of the transformers (3,033,680 kVA). Only 3 per cent. of the boiler capacity installed consists of Japanese plant, and this is all in private service.

A Rumanian Radio Exhibition.—It is reported from Bucharest that the Rumanian postal authorities are organising a permanent exhibition of radio apparatus in the head office in that city with the object of encouraging interest in radio matters in Rumania. Any British firm interested in the exhibition would doubtless be able to obtain particulars through the British Consul in Bucharest.

Lighting and Power Notes.

Barrow.—LOAN.—The Corporation has approved the recommendation of the electrical engineer that application be made for sanction to the borrowing of £48,000 for electricity purposes, made up as follows:—E.h.p. transmission lines, £31,000; sub-station buildings, £2,500; sub-station switchgear and transformers, £8,000; h.p. and l.p. distributing mains and services (Dalton and Ulverston R.D.C.), £6,000; meters, £500. The General Purposes Committee has considered terms with the Backbarrow Charcoal Iron Company and the Lancashire Ultramarine Company for the use of the River Leven at Backbarrow for the purpose of a proposed hydro-electric station. An official report of this meeting has not been issued, but it is understood that the members were in favour of the terms submitted subject to the proposed agreements being approved by counsel.

Bolton.—LOAN.—The Electricity Committee is applying for sanction to the borrowing of £75,000 for mains extensions for the next three years.

(*Continued on page 103*)

Imperial Wireless "Beam" Communication.

Progress of the Canadian and South African Service Stations.

THE year 1926 bids fair to be one of the most important in the history of commercial wireless telegraphy as it affects Great Britain and the Empire. In a few months' time the first of the new Marconi-type "beam" stations will be brought into operation, and in the course of the year direct high-speed wireless services on the short-wave system will be established with all the principal Dominions The first of the "beam" stations are in an advanced state of construction. All the masts have been erected, the buildings completed, and the machinery and some of the wireless apparatus installed. The main part of the wireless apparatus (the transmitters and receivers) is now being tested at the Marconi Co.'s works at Chelmsford, and it will be installed as soon as the tests are completed. Meanwhile, work is progressing on the erection of the aerial and feeder systems, and in fencing and roadmaking.

Fig. 1.—Bodmin Transmitting Station: Rectifying Panels.

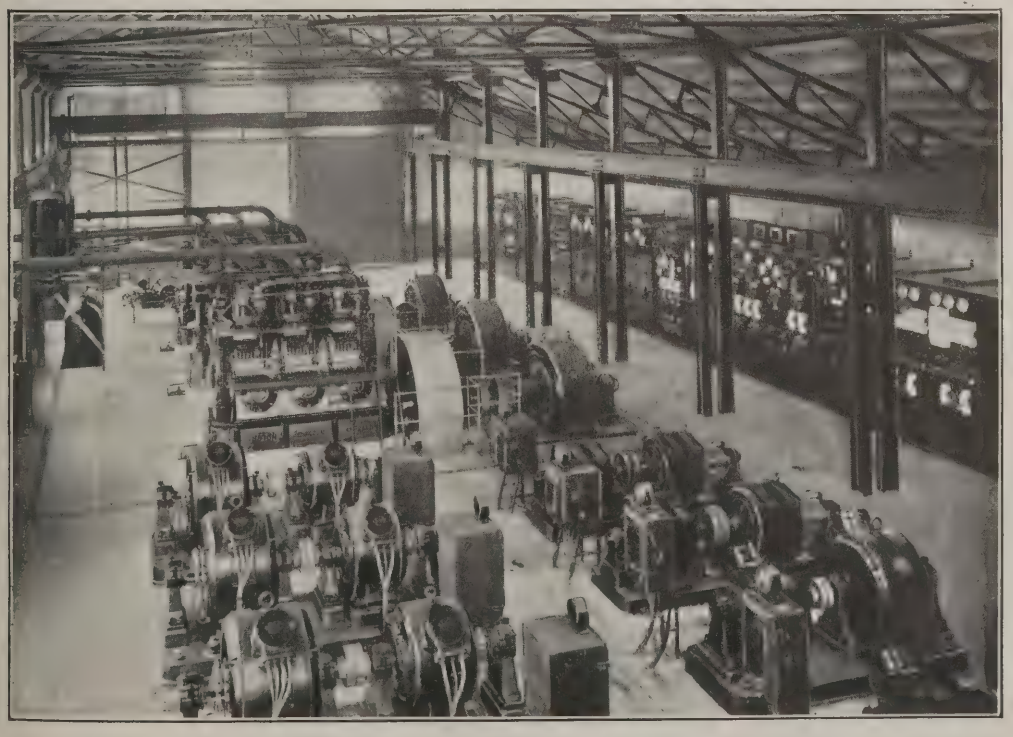

Fig. 2.—Bodmin Transmitting Station: Power Generating Plant and Switchboard.

The stations now nearing completion are at Bodmin in Cornwall, and at Bridgwater, in Somerset. The Bodmin transmitting station will be used for communication with Canada and South Africa, and the Bridgwater station will be the receiver for these services. At each station there are ten masts, five for communication with each Dominion, and their design is identical for the transmitting and receiving stations. The five masts for each Dominion are erected in a straight line at right angles to the direction in which communication is to be established; they are 277 ft. high, each having a cross arm at the top measuring 90 ft. from end to end. The aerial and reflector will consist of a number of vertical wires suspended from triatics attached to the cross arms of the masts. There will thus be two parallel steel cables, separated by a distance which depends on the wave-length used, running on each side of the masts from the first to the last. From these cables the vertical aerial and reflector wires will be suspended, the lower ends of the wires being kept in position by balance weights. The distance between the masts is 650 ft., from centre to centre, and the length of the whole system of five masts for each transmitter is about 3,200 ft. from tail anchor block to tail anchor block.

Fig. 3.—Bridgwater Receiving Station: Switchboards and Station Lighting and Battery Charging Plant.

At the Bodmin transmitting station the power plant consists of Ruston & Hornsby cold-starting oil engines driving d.c. generators built by Messrs. Newtons, of Taunton. The various voltages required for the operation of the valves will be supplied by motor generators and alternators. The valves themselves will be of the oil-cooled type, and the complete valve transmitters will be housed in a separate room adjacent to the power house. The generating plant has been mounted on a concrete raft, supported on cork to prevent vibration reaching the transmitting set, and the valve oscillators themselves are mounted on a similar raft. From the transmitting room feeders are led to the aerials by

means of copper tubes fixed above the ground. At the Bridgwater receiving station power is supplied by 18-h.p. two-cylinder Aster engines driving the d.c. generators which supply the station with light and drive the machines for charging the receiver batteries.

The first of the accompanying reproduced photographs shows the rectifying panels at the Bodmin transmitting station; behind them are mounted the "smoothing" units (which are illustrated in fig. 5), the well-known Marconi system of rectified alternating current being utilised at these stations. At the Bodmin station all the power required will be generated on site, and fig. 2 shows the machinery hall containing the plant referred to above. In striking contrast to this, fig. 3 is a view of the much smaller power plant needed at the Bridgwater receiving station; on the left are seen the switchboard and one of the small generating sets which supply the station lighting and drive the motor-generators (shown on the right) provided for battery-charging purposes. It will be noticed that the two lines of masts depicted in the last illustration are at right angles to each other, which arrangement provides for the left-hand row being used for the Canadian service, while the right-hand row of masts serves for the South African service.

Both transmitting and receiving stations will be connected by direct land lines with the Central Telegraph Office, G.P.O., London; the incoming signals will be automatically relayed to the land line at Bridgwater and passed on to the Central Telegraph Office, London, and the outgoing and incoming messages will be dealt with at the same table in the telegraph office, thus giving true duplex working and complete central control over the traffic. For the "beam" system, whereby the radiated energy is concentrated in one direction, very much smaller power is required for communicating over any given distance than in the case of high-power stations which radiate energy in all directions, while, in addition, the speed of working, and freedom from interference, are greatly increased.

Fig. 4.—Bridgwater Receiving Station, showing some of the Masts.

The corresponding stations in Canada, near Montreal, and South Africa, near Cape Town, are in practically the same state of advancement as the English stations, and other similar stations of the Imperial system are being erected at Grimsby and Skegness, in England, for communication with other stations at Poona, in India, and Melbourne, in Australia. In fact, at the present time the Marconi Company has in hand no fewer than 17 short-wave transmitting stations, including its own station at Dorchester, for communication with New York and South America.

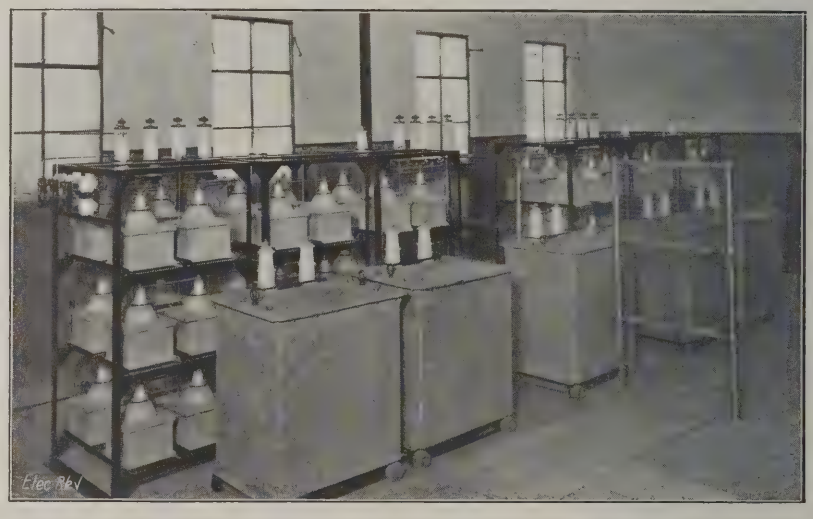

Fig. 5.—Bodmin Transmitting Station: "Smoothing" Units for Rectifiers.

Fig. 6.—"Canadian" Masts (Left) and "South African" Masts (Right) at Bridgwater.

The Imperial stations have been designed and are being built by Marconi's Wireless Telegraph Co., Ltd., for the General Post Office, the buildings and foundations being carried out to the Marconi Co.'s design by the Foundation Co., of London. At Bodmin the masts have been supplied and erected by the Armstrong Construction Co., and at Bridgwater they have been erected by Messrs. Francis Morton and Co., who are also responsible for the supply and erection of the masts at the Grimsby and Skegness stations.

It is understood that probably two wave-lengths will be utilised at each station so that in the event of interference, or fading, being experienced on one, a change over to the other could be made. It will be recalled that the original intention was to have the stations in operation this month as specified by the Canadian agreement which was signed in July, 1924.

Electricity Supply at Maidstone.

Some Particulars of the Recently Inaugurated Extensions.

THE public supply of electricity in Maidstone was commenced in 1901, with plant consisting of four hand-fired boilers and five d.c. engine-driven generators, having a total capacity of 675 kW. In 1908 the buildings were extended, a 500-kW set and an additional boiler were

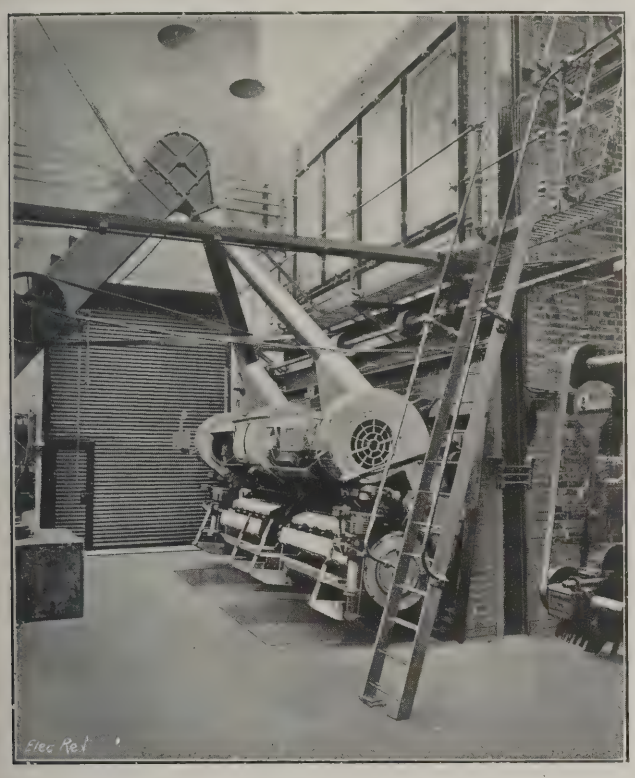

Fig. 1.—30,000-lb. Boiler with Underfeed Stoker.

installed, and mechanical stokers were fitted to the boilers. Additional plant became necessary in 1913, when a sixth boiler and another generator set, 825 kW, were added to the plant. Early in the war three of the old 150-kW sets were taken for "urgent Government requirements," and in their place were installed a 1,250-kW turbo-alternator and a 1,000-kW rotary converter. At a later date a second turbo-alternator, 1,500 kW, and a 30,000-lb. water-tube boiler were installed. In 1919 and 1920 the system of generation was changed to a.c., 3-phase, 50-period, 6,600-V, and a further 30,000-lb. water-tube boiler together with a third Brush-Ljungström turbine of 1,500 kW were put down. The recent extensions which were officially inaugurated on December 19th last (ELECTRICAL REVIEW, December 25th) include boiler and turbo-alternator plant, and the necessary switchgear, contained in a new ferro-concrete building, designed by Messrs. Mouchel & Partners, and erected by Messrs. Corben & Son, local builders.

The boiler plant was supplied and erected by Messrs. Vickers Boiler Co., Ltd., and comprises two water-tube boiler sets in brickwork, with a working pressure of 225 lb. per sq. in., and a heating surface of 6,000 sq. ft. each. They are fired by mechanical stokers, one having a stoker of the Bennis chain-grate type, and the other an Underfeed self-contained travelling-grate stoker, fig. 1, the grate area in each case being 170 sq. ft. Integral superheaters designed to give a final steam temperature of 650 deg. F., and a Green vertical economiser are provided with each boiler. A new draught equipment consists of one Louis Prat "Evasé" chimney, 80 ft. high, equipped with induced-draught fans. Two vertical direct-acting boiler feed pumps, each capable of dealing with 6,000 gallons of water per hour, one cast-iron hot-well tank having a capacity of 2,500 gallons, and two Bennis 8-in. bucket coal elevators are also installed.

A large panel placed opposite the front of the boilers accommodates the boiler instruments, including CO_2 recorders, pressure and draught gauges, and load indicators.

A 3,000-kW Brush-Ljungström turbo-alternator, fig. 2, with the necessary condensing plant and auxiliaries form the turbine generating plant. The turbine is direct coupled to two alternators having a combined output of 3,000 kW at 0.8 power factor, 6,600 V, 50 cycles, 3-phase, at 3,000 r.p.m. The condenser is of the two-flow surface type; it has a cooling surface of 4,000 sq. ft., and is capable of dealing with 35,500 lb. of exhaust steam per hour. Air is extracted from the condenser by means of a two-stage Brush-Delas ejector, capable of dealing with 20.75 lb. of dry air per hour. The condensate is removed by means of a Pulsometer centrifugal pump, and delivered to a Wright recorder, whence it is pumped to the hot well by a separate lift pump. The circulating water is delivered to the condenser by a motor-driven centrifugal pump of the Sunturbo type, made by Messrs. J. Stone & Co., Ltd., and a Carr's patent rotary screen, made by Messrs. Ledward and Beckett, deals with the circulating water. The coal handling plant was supplied by Messrs. Edward Bennis and Co., Ltd.; it consists of a conveyor trough incorporated with that previously existing so that fuel is fed in two directions at the same time, dealing with both coal borne by road and by rail. Installed at the river side is an electric crane which takes the coal from barges, and discharges it into a hopper serving an Avery weigher and totaliser.

A three-panel G.E.C. slate switchboard, with steel plate cubicles, accommodates the necessary switchgear and instruments. The alternator switchgear consists of an oil circuit breaker having a breaking capacity of 125,000 kVA, and provided with two overload and one shunt trip coils. Two sets of signal lamps indicate

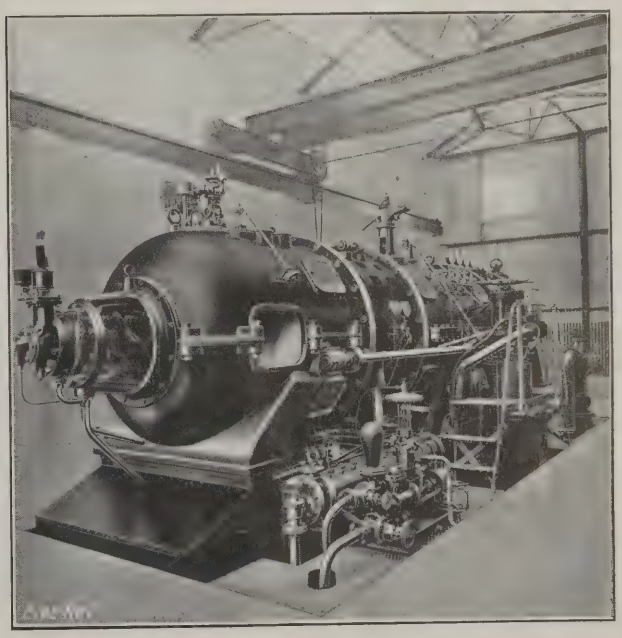

Fig. 2.—3,000-kW Turbo-Alternator.

whether the oil switch is in the "on" or "off" position, and whether the isolating switches are closed. A Brown, Boveri automatic pressure regulator is installed.

The total capacity of the station is now 8,575 kW, and the consumption of electricity per head of the population is about 400 kWh per annum.

The extensions to the plant were designed by the electrical engineer, Mr. E. E. Hoadley, M.I.E.E., who was assisted by Messrs. C. E. Winkle, E. E. Pope, and T. F. Maud.

A Large Hydro-Electric Development.

The New Generating Station at Isle Maligne, Quebec.

WHAT was to be completed by the middle of last summer, the first of two hydro-electric schemes projected by the Quebec Development Company for harnessing the waters of the Saguenay River at Isle Maligne, is claimed to be the largest single installation in water-power development ever undertaken. The Saguenay River is one of the great tributaries of the St. Lawrence River and flows out of Lake St. John by two channels, the Grand Discharge and Little Discharge. Lake St. John is located about 100 miles north of Quebec City. Its normal water level is 310 ft. above mean sea-level, and its drainage area is estimated to be 30,000 square miles. The Grand Discharge is divided into two channels by Isle Maligne, at the foot of which, in the left channel, fig. 1, is located the power house.

Fig. 1.—Plan of Development.

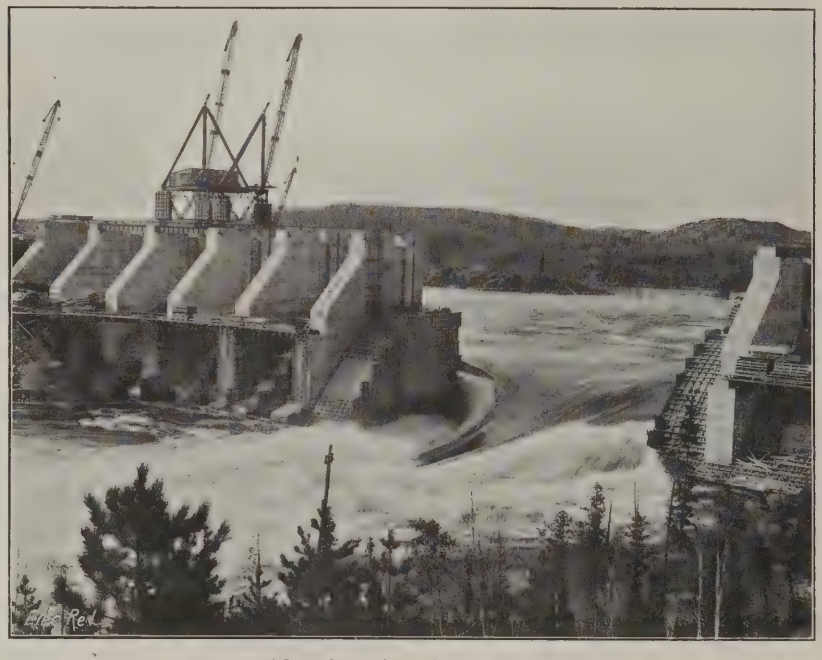

Fig. 2.—Main Dam, Isle Maligne, during Construction.

The main structure, fig. 2, consists of a combined gravity dam and power house, 720 ft. in length, with a bulkhead extension at the north end, 330 ft. long, inclined upstream at an angle of 30 deg., and tailrace walls carried downstream at either end at right angles to the building. The power house sub-structure and adjacent walls are built of concrete and the superstructure is built round a steel framing with brick and tile walls and a roof of reinforced gypsum slabs with tar and gravel finish.

The intake of each turbine is formed by twin rectangular openings, 16 ft. by 22 ft., in the concrete wall, each controlled by a butterfly valve. These converge into one, in which the rectangular section is gradually changed into a circular one, meeting the 22-ft. diameter steel penstock which carries the water to the steel-plate spiral casing. The latter surrounds and is riveted to the speed-ring, a massive cast-steel erection, 21 ft. 6 in. in diameter, consisting of top and bottom machine-faced flanges with interconnecting ribs between which the water is delivered to the runner. This is of cast iron, with a maximum diameter of 15 ft. It is cast in one section, and is connected to the generator by the main shaft, which is 28 ft. long and 29 inches in diameter.

In addition to the main structure, there are seven spillways and an earth dam to close up the channels and waterways and to direct all the water to the required channel only.

The construction of the station provides for the installation of 12 vertical, single-runner, Francis turbines, aggregating a total of 540,000 h.p. At the time of the preparation of our information eight turbine units were completely installed, and the foundations for the four additional machines were well advanced. The head on the turbines is between 100 and 120 ft., giving each a variation in horse power from 35,000 to 45,000. An individual governor system operating under an oil pressure up to 220 lb. per sq. in. is provided for each turbine, and the piping is so arranged that the governors may be operated separately or as an interconnected system of units in groups of four. The governor flyballs are directly connected to the turbine shaft below the rotor. The governor stands, gear-type oil pumps, pressure tanks

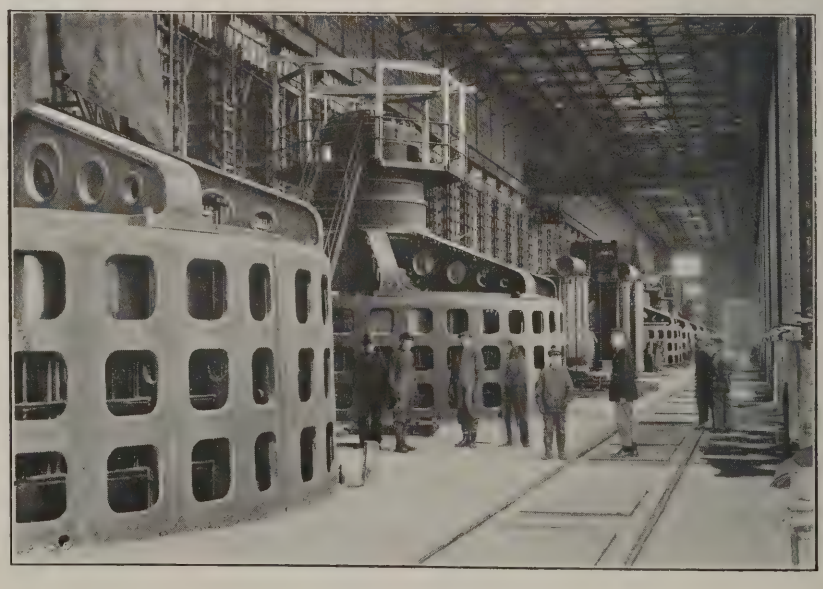

Fig. 3.—Interior of Power House.

and receiving tanks are located in the spacious power-house basement or turbine room. An emergency stop device is installed for each turbine, enabling the operator at the benchboard to shut the turbine gates and stop any machine without the assistance of an operator in the turbine room. The closing time for each of the governors is three seconds.

The eight generators directly connected to the turbines each have a continuous full-load rating of 30,000 kVA at 13,200 V, three phase, 60 cycles, 112.5 r.p.m. Each generator is equipped with an upper and a lower guide bearing. The thrust bearing on top of the generator is of the Kingsbury type, and its housing is provided with water-cooling coils. The individual exciters placed above the thrust bearings each have a full-load rating of 185 kW at 250 V.

The oiling system of each generator unit is self-contained and automatic in operation. The thrust bearing is immersed in an oil reservoir containing water-cooling coils located on top of the upper bearing bracket. A geared pump, mounted in a smaller oil reservoir located below the lower bearing bracket, is driven by a gear on the generator shaft and forces the oil to the upper thrust-bearing reservoir. Proper pipes also conduct the necessary oil to the two guide bearings, and the overflow oil from each bearing is carried back to the lower reservoir for re-circulation. Large brakes are provided for four of the eight arms of the lower generator-bearing bracket. If operated by air pressure, the brakes will stop the generator with the turbine gates closed, and if operated by oil pressure from the governor system, the brakes may be used as jacks to lift the rotor. Cast-iron stools are provided for mounting on the bracket arms to support the rotor when lifted.

Each generator armature is star-connected, and the six leads are brought out from the upstream side of the generator. By means of a 15,000-V disconnecting switch, the neutral point is connected to the neutral bus-bar consisting of a $\frac{3}{4}$-in. copper tube suspended by porcelain insulators on the mezzanine floor along the upstream side of the power house, and it is then earthed outside the station. Normally each generator feeds its own transmission line, and a low-pressure bus system provides for the transfer of energy from another generator in case of emergency and the means for delivering energy to the transformers for the station auxiliaries.

The rating of each circuit breaker is 3,000 A at 15,000 V, and the guaranteed interrupting capacity is 65,000 A at 13,200 V. An electrically-operated motor mechanism is provided for each breaker, and an arrangement is made for emergency manual operation. D.c. energy at 230 V, for the operation of the mechanism, is furnished from a 25-kW motor-generator set.

For the station use there are installed two banks of transformers, which are located in the centre of the high-pressure room, and each bank consists of three 200-kVA single-phase transformers stepping down from 13,200 to 550 V. Two 100-ton power-house cranes, a 100-ton crane for lifting and transferring apparatus from the generator room to the high-pressure room, a 60-ton gantry crane on top of the power house bulkhead, and 16 headgate hoist motors are installed.

For the actual construction of the power house, fig. 3, a steel trestle was built on the site of the structure and along its full length, carrying three lines of standard track and derrick gantry rails on either side. The whole of this trestle, with the exception of the floor members and the rail girders, is built into the dam.

During the construction an electricity supply was received from Chicoutimi, where Messrs. Price Bros., who are part owners of the development, have a hydro-electric plant, by means of a 44,000-V 40-mile transmission line.

We are indebted to Mr. W. S. Lee, chief engineer of the Duke Price Power Co., for the information given above, to the *Electrical News* (of Toronto) for the diagram, fig. 1, and to the Canadian National Railways for the photographs.

Lighting and Power Notes.

(*Continued from page 98.*)

Birmingham.—ELECTRICITY EXTENSIONS APPROVED.—At a meeting of the City Council on January 5th the chairman of the Electricity Supply Committee, moved a resolution authorising the latter to proceed with the installation of a 10,000-kW turbo-alternator set at a cost of £60,000. The resolution was adopted, and it was agreed to spend £158,000 on additional sub-stations and equipment and £260,000 on mains.

Bromley (Kent).—PRICE REDUCTION.—The Bromley Electric Light & Power Co., Ltd., has made a further reduction of 1d. per kWh in the charge for electricity for lighting. The revised rate is 7d. per kWh subject to a minimum charge of 8s. 9d. for the winter quarters and 5s. 10d. for the summer quarters.

Canada.—HYDRO-ELECTRIC DEVELOPMENT.—An official statement recently issued shows that new hydro-electric installations during the past year totalled 719,000 h.p., bringing the total to 4,290,000 h.p. The year's developments have involved a capital expenditure of $70,000,000, exclusive of the new capital required for the utilisation of the energy generated.—*Reuter's Trade Service* (Ottawa).

Clitheroe.—ELECTRICITY SUPPLY.—The Corporation is preparing for the early introduction of electricity in its area. The terms include a fixed charge for power purposes of £5 per kW of maximum demand, and $\frac{1}{2}$d. per kWh, the consumer to provide a transformer station and the Corporation the transformer.

Continental.—SWEDEN.—It is announced from Stockholm that the hydro-electric station which has been established at Lilla Edet by the Swedish Government for the supply of power to the Stockholm-Gothenburg railway has recently been completed.

FRANCE.—The City Council of Paris has recently approved a large programme of works to be executed by the Compagnie Parisienne de Distribution d'Electricité with the object of coping with the continuous development of the consumption. The works will extend over several years, and will involve a loan of about 356 millions of francs.

GERMANY.—The Berlin correspondent of the *Daily Mail* reports that £3,000,000 is being spent on the erection of electricity works at Rummelsburg, on the outskirts of Berlin. Dr. Rehmer, the director of the works, states that the undertaking will be completed in the course of the year and that the plant will have a capacity of 160,000 kW.

Elland.—LOAN.—The Urban District Council has applied for sanction to a loan of £1,400 for street lighting in the north ward.

Hamilton.—TRANSFER OF UNDERTAKING.—The local electricity undertaking was recently formally transferred from Messrs. Edmundsons' Electricity Corporation, Ltd., to the Town Council.

Hebden Bridge (Yorks.),—LOAN.—The Urban District Council has made application for sanction to borrow £1,000 for the purchase of electric cookers and other domestic appliances, to be let out on hire.

Keighley.—EXTENSION OF SUPPLY.—The Town Council has authorised the Electricity Committee to proceed with the transmission line from Eastburn Foundry and the laying of mains for the purpose of a supply of electricity to the township of Sutton.

Liverpool.—LOANS.—The Corporation has received sanction to a loan of £200,000 for distributing mains.

The Tramways and Electric Power and Lighting Committee has made application for sanction to the borrowing of £69,799 for provision of h.p. and l.p. mains and services, and sub-station buildings and plant, for the supply of electricity to the Walton-Clubmoor, Highfield, Pinehurst Road, and Strawberry Lane housing estates.

MAINS EXTENSIONS.—The City Council has approved of the extension of mains in the Old Swan district at an estimated cost of £7,960, concurrent with the laying of a h.p. main from Lister Drive to Knotty Ash. Authority has also been granted for extension of mains in Higher Road, Hunt's Cross, at an estimated cost of £1,350.

Maidenhead.—OPPOSITION TO BILL.—The Town Council has decided to oppose the Bill of the Metropolitan Electric Supply Co. for powers to increase the area of supply which might encroach upon the powers of the Corporation undertaking.

LOAN.—Sanction has been received to a loan of £5,000 for mains and services.

Manchester.—PROGRESS DURING NOVEMBER.—During the month of November the Corporation electricity undertaking showed an increase in connections of 1,784 kW, bringing the total to 273,412 kW; and the number of applications received for supply, including existing consumers for additional supplies, was 1,052, representing a total of 2,942 kW. The number of consumers connected increased by 441, and the number of hired cookers connected by 81, bringing the total actually on circuit to 1,149. Applications for the hire of cookers totalled 108.

ELECTRICITY SUPPLY RECORDS.—On December 3rd, the output reached 1,575,920 kWh, and on December 15th, the maximum supply demanded reached 136,560 kW, both figures constituting records in the history of the undertaking.

Morecambe.—ELECTRICITY CHARGES.—At a recent meeting of the Town Council a letter was received from the Heysham Urban District Council, suggesting a joint arrangement for charging for electricity supplied from Morecambe to private houses in Heysham on the basis of the rateable value of the premises, plus a small charge per kWh. It was resolved that the Heysham authority be informed that the proposal was at present under consideration and would shortly be reported on by the borough electrical engineer. The Council also received correspondence from the Morecambe and Heysham Master Builders' Association, with regard to the revision of charges for laying electricity services in private premises. The electrical engineer submitted a revised table of charges for various classes of service, and the matter was deferred to the next meeting. The borough electrical engineer reported that the laying of an additional e.h.p. feeder cable had not been commenced owing to the L.M. & S. Railway Company's asking to be supplied with energy for working the Heysham branch electric line, and that would affect the direction in which the cable would be laid. There was a considerable portion of the feeder which would be common to both schemes, and the engineer was instructed to proceed forthwith with the laying of such portion.

Newport (Fife).—ELECTRICITY AGREEMENT.—The Newport Town Council has come to an agreement with the Fife Tramways Light & Power Co., Ltd., regarding the laying of cables in the burgh.

North-West Midlands Electricity District.—LOCAL INQUIRY.—In pursuance of the Electricity Commissioners' provisional determination of the above-named district, the Commissioners will hold a local inquiry at the Town Hall, Stoke-on-Trent, on February 17th, 1926, at 10.30 a.m. and following days, if necessary, with reference to the area to be included in the proposed district, and to consider a scheme which has been submitted by a Conference of Authorised Undertakers in the District for improving the existing organisation for the supply of electricity in the district and for the formation of a Joint Electricity Authority. Copies of the scheme may be obtained from Mr. H. H. Battle, hon. secretary to the Conference of Authorised Undertakers, Borough Hall, Stafford, at a cost of 10s. 6d. each. Representations with regard to the scheme should be addressed to the Secretary, Electricity Commission, Savoy Court, Strand, London, W.C.2, not later than February 6th, and a copy of such representations should at the same time be sent to the hon. secretary to the Conference at the address mentioned above.

Retford.—ELECTRICITY SCHEME.—At a recent special meeting of the Town Council it was agreed that the draft specification and tender form prepared by Mr. A. H. Seabrook for the new electricity scheme be accepted, and that a fee of £1,600 be paid on an estimated expenditure of £27,000. The plant, which is to be installed at the Corporation gasworks, will consist of one 50-kW steam-driven generating set and one 150-kW and one 250-kW gas engine-driven sets. The Committee was given power to increase the capacity as the demand arose.

Scarborough.—TRANSFER OF UNDERTAKING.—The formal transfer of control of the Scarborough electricity works from the Scarborough Electric Supply Co., Ltd., to the Corporation, under a recently agreed purchase arrangement, took place on January 1st, Mr. J. J. Addy, a director of the company, formally handing over the works to the Mayor.

Sheffield.—MAINS EXTENSIONS.—The Corporation Electric Supply Committee has approved extensions of mains for general distribution purposes at an estimated cost of £21,843, and electricity extensions and works at an estimated outlay of £3,705.

South Africa.—JOHANNESBURG.—The Johannesburg correspondent of *The Times Trade and Engineering Supplement* reports that the Town Council has failed to obtain from the Transvaal Provincial Council the necessary sanction to a proposed expenditure of £500,000 on a new power station, the Provincial Administrator taking the view that the town could more economically supplement its existing supply by an arrangement with the Electricity Supply Commission, on whose behalf the Victoria Falls and Transvaal Power Co. is at present erecting a super station on the Witbank coalfield. The Council, being already committed to an expenditure of over £20,000 on the scheme, has decided to carry out the proposed extensions by means of a 10 per cent. addition to the existing plant annually, which it is empowered to do without reference to the Provincial Authority. Already a new 10,000-kW set is being installed, but it is doubtful if this will be sufficient to meet the needs of the town during the next winter. Although the Victoria Falls and Transvaal Power Co. generates electricity at a cost which enables it to supply the requirements of the gold mines of the Witwatersrand at less than 4½d. per kWh, the Johannesburg Town Council estimates that it can generate at a still lower cost and effect a saving of about £23,000 per annum, as compared with the cost of taking a supply from the company.

South-East Lancashire Electricity Advisory Board.—*Electricity Supply for Eccles.*—The Engineering Advisory Committee has considered the question of a bulk supply to Eccles Corporation, and has decided that in the interest of the district, it is of opinion that the supply to Eccles should be furnished from the Barton station of the Manchester Corporation, but that as the Agecroft station is a possible alternative source of supply, the Eccles Corporation be recommended to invite offers for its requirements from the Lancashire Electric Power Co. and the Salford Corporation upon conditions defined by the Committee.

Main Transmission Line.—The Committee has recommended the Board to approve the construction of the 33,000-V transmission line by the Lancashire Electric Power Co. and Rochdale Corporation.

Bulk Supply to Leigh.—The question of a bulk supply to Leigh Corporation has been considered, and the Committee has decided that the proper source of the bulk supply required by the Corporation is the Barton power station, *via* the Lancashire Electric Power Co.

Alderley Power Station Extension.—The consideration of the application of the Alderley and Wilmslow Electric Supply, Ltd., for permission to install an additional 120-kW Mirrlees Diesel engine, direct coupled to a 3-phase, 50-cycle alternator, was adjourned.

The minutes of the proceedings of the Committee have been adopted by the Board.

Southport.—NEW PLANT.—In view of the increasing maximum load on the station, the borough electrical engineer (Mr. E. Moxon) has suggested to the Electricity Committee that it should approach the Electricity Commissioners with reference to the installation of a 6,000-kW turbo-alternator. This would be required for service in the winter of next year.

Special Orders.—The Electricity Commissioners have submitted to the Minister of Transport for confirmation Special Orders made by them authorising the Birmingham Corporation to supply electricity in the rural district of Solihull, and part of the rural district of Meriden, and the Isle of Wight Electric Light & Power Co., Ltd., to supply in the rural district of the Isle of Wight.

Applications have been made for Special Orders by the following authorities:—The Brighton Corporation to supply electricity in the parish of Telescombe, and to revoke the Order granted under Section 6 of the Electric Lighting Act, 1909; and Norwich Corporation to supply in the urban district of North Walsham and certain parishes in the rural districts of Aylsham, Blofield, Forehoe, Henstead, Loddon and Clavering, Mitford and Launditch, Smallburgh, St. Faiths and Wayland.

Sutton Coldfield.—ELECTRICITY EXTENSIONS.—The Borough Council is applying for sanction to the borrowing of £28,650 for improvements and alterations to plant. The electrical engineer (Mr. T. Bloore) states that whilst the present plant should meet satisfactorily the winter demand, it would be advisable to make further provision at Roland Road power station and the Lime Grove sub-station in readiness for the winter of 1926-27. On December 4th the maximum load on the undertaking was 1,102, against 783 kW last year. Further provision is necessary, in view of the probability of supplying in the near future the districts of Streetly and Little Aston.

Truro.—ELECTRICITY SUPPLY.—The City Council has approved the proposed agreement with Messrs. Edmundsons and the draft of the Special Order in connection with the electricity supply for the district.

United States.—HYDRO-ELECTRIC DEVELOPMENT.—The *Electrical World* reports that work is now actually under way on the Bucks Creek development of the Feather River Power Company in Northern California, to cost $8,500,000, and equipment for the two 32,000-h.p. impulse waterwheels and the two 25,000-kVA generators will soon be ordered. The development is being made by the Feather River Power Company of San Francisco, and upon completion of the project in August, 1927, the entire output of the plant will be sold to the Great Western Power Company. In consideration of the price to be paid for the power the plant is to become the property of the Great Western Power Company at the end of 35 years.

The House of Representatives, by 248 to 47 votes, has authorised the creation of a Joint Congressional Committee empowered to negotiate a private lease for the nitrate and water-power project constructed in war time at Muscle Shoals, at the confluence of the Tennessee and Alabama rivers.

Wath-on-Dearne.—ELECTRICITY IN SMALL HOUSES.—It was reported at a recent meeting of the Council that the Dearne Valley Electric Board had decided to allow householders to extend the payment of the cost of installation of electricity in their houses over a period of five years. This will amount to about 1s. 6d. per week per house.

Wimbledon.—ELECTRICITY SUPPLY.—The Electricity Committee has decided to lay new feeder mains at a cost of £12,250, and to enlarge and re-equip five sub-stations at a cost of £3,200.

Worcester.—ELECTRICITY EXTENSIONS.—The City Council has authorised the Electricity Committee to spend £3,000 on account of the £33,000 sanctioned, to procure plant for the supply of electricity to the extended area. It was stated at a recent Council meeting that the Electricity Commissioners' consent to the scheme was expected about the middle of January.

Worthing.—LOANS.—The Electricity and Waterworks Committee has recommended to the Town Council that application be made for sanction to the borrowing of £10,500 for plant and cables in connection with the supply of electricity to the East Preston rural district, and £12,635 for a Diesel engine and dynamo, &c.

Tramway and Railway Notes.

Continental.—SWITZERLAND.—The Swiss Federal Railway Authorities in Berne have recently issued a report on the progress of the electrification of the Swiss railways, which shows that, excluding the lake valley lines, about 488 miles of the system have so far been converted to electric traction. All the lines, with the exception of about 47 miles, are operated on the single-phase a.c. system. Additional sections of the system are being electrified at the rate of about 125 miles per year. The Palezieux-Geneva section will soon be completed; the Zurich-Rapperswil line will be completed next summer; the Brugg-Biel line and the Brigniue-Sitten line by the end of 1926; the Winterthur-St. Gall-Rorschach, Rothkreuz-Rupperswill and Palezieux-Freiburg-Berne sections by the summer of 1927; the Richterswil-Chur, and the Winterthur-Romanshorn-Rorschach lines by the summer of 1928; the Biel-Delsberg and the Zurich-Schaffhausen lines by the end of 1928. The length of the track in hand is about 490 miles, which will bring the total of electrified lines in Switzerland, including the lake valley lines, to approximately 1,010 miles by the beginning of 1929. This represents about 56 per cent. of the Swiss railway system.

GERMANY.—Inquiries are being made into the possibilities of economies in working by electrifying the railway between Frankfort-on-Main, Mannheim and Basle. It is considered that the necessary electrical energy could be supplied by the hydro-electric stations on the Upper Rhine.

Japan.—NEW ELECTRIC RAILWAYS.—It is reported that a contract has been given to the Kawakita Denki Kigyosha, of Tokio, by the Nasu Electric Railway Co., Ltd., for the construction of an electric railway between Kurodahara station on the Government north-eastern line and the Nasu Yumoto hot springs, a distance af ten miles.

The Uyeda Onsen Denki K.K. is to proceed with the construction of the suburban electric railway at Uyeda, Shinshu.

The Odawara Rapid Transit Railway Co., will shortly commence work on the line from Shinyuku to Odawara, a distance of 60 miles. The line will be opened for traffic in May, 1927.

Liverpool.—TRAMWAY EXTENSIONS.—The Ministry of Transport has sanctioned the borrowing by the Corporation of £91,102 for the purpose of constructing tramways authorised by the Liverpool Corporation Tramways Order, 1925. The Tramways Committee intends to apply for sanction to borrow £6,132 for the construction of tramways connecting Great Crosshall Street with Tithebarn Street, and the construction of an additional junction at the corner of Great Crosshall Street and Byrom Street.

London.—TUBE "SPEED-UP."—In the course of the next eighteen months the rolling stock of the Central London Tube is to be remodelled and refitted throughout, to provide the same standards of comfort and efficiency as are now afforded on the Hampstead and City lines, at a cost of £200,000. The first of the 250 new coaches is already in commission, and a recent experiment demonstrated that passengers alighted from it in 12 seconds, as against 28 seconds taken by passengers in an adjoining coach. This is due to the substitution of pneumatically controlled doors, giving access immediately into the compartment, for the manually-operated and much smaller gates at the ends of the coaches. The improvements include more commodious seats, better lighting, and better ventilation. Instead of four motors on the six-seven car trains, there will be six, and this increase of power will, it is estimated, enable four minutes to be saved on the through journey. Six trains will be running by Easter.

INQUIRY.—It is anticipated, according to the Finance Committee of the Camberwell Borough Council, that the inquiry to be held by the London and Home Counties Traffic Advisory Committee into the question of the provision of tube railways for the South-East London district will be held about the end of the present month.

Newcastle-on-Tyne.—LOAN.—According to the *Financial Times*, subject to the assent of the ratepayers under the Borough Funds Act, the Corporation is applying to Parliament next session for power to borrow £2,147,125. Of this sum £118,125 is the amount proposed to be paid for the purchase of the undertaking of the Tyneside Tramways and Tramroads Co., and £71,500 is for improvements to the tramway system.

Telegraph and Telephone Notes.

France.—INCREASED TELEGRAPH AND TELEPHONE RATES.—The further fall of the franc has been followed by a fresh increase in foreign telegraph and telephone rates. The basic rate now has to be multiplied by 5.3 for international messages, as compared with a multiplication by 4 at the beginning of August, 1925, and by 5 on December 10th, 1925. Contrary to the practice obtaining hitherto, substantial increases have also been made in French colonial rates, the same multiplier index being applied as for international telegrams except in the case of messages sent to French colonies by wireless, or *via* Dakar, in which case the basic rate will be multiplied by 3.5 only.—*Reuter* (Paris).

Germany.—AUTOMATIC TELEPHONY.—Despite the financial difficulties attending the introduction of new methods by the post office authorities, the introduction of the automatic telephone system has made rapid progress in Germany. A beginning in this respect was first made in 1907 by the conversion of the Hildesheim network to the automatic system, but further work was interrupted by the war and in the three years immediately following, and it was only possible to make a fresh start in 1922 in a systematic manner. As a manual exchange only has a life of about 15 years and many exchanges have to be annually renewed, it was decided in the latter cases to change over to the automatic system as being more appropriate, notwithstanding the additional expenditure involved of from 50 to 100 per cent. above the cost of manual exchanges; on the other hand, the automatic system results in a saving of labour and of other working expenses. The aim of the postal authorities now is to completely transform the local networks within a period of 15 years. At present in the old Reich telegraph area there are 33 large exchanges with 105,000 automatic connections, 29 medium exchanges with 10,000 automatic connections, and 113 exchanges with 8,000 such connections, and preparations are being made for the conversion of a similar number of other exchanges. The course of the financial position will determine whether the 15 years' programme will be entirely carried out.

Peru.—MARCONI CONCESSION.—One of the most bitterly contested concessions in the recent legislative history of Peru terminated with the Senate's ratification of the Marconi contract for twenty-five years for the administration of the Peruvian post, telegraph and wireless services. The concession has been in effect under a referendum clause since 1921, though the opposition of politicians and private interests threatened its annulment, says the *Financial Times*. It is understood that its ratification coincides with the initiation of an energetic construction programme, including the erection of a "beam" station for communicating with the United States, Buenos Aires, Rio de Janeiro and Bogota. The programme provides for expenditure exceeding £500,000.

The Telephone Service.—POLICE SIGNALLING DEVICE.—A new system of police signalling is being tried in the provinces. At some twenty sites in the borough of Halifax telephone boxes have been placed, and in an elevated position near them are fixed coloured lights; by the latter the officer on duty at the police station can call the attention of a constable on beat in the neighbourhood, who will at once go to the telephone box for instructions.

LONG-DISTANCE SERVICE.—It is understood that London will shortly be able to communicate by telephone direct with Wick, a distance of about 730 miles, when junction apparatus has been installed. This installation will also link the extreme north of Scotland with Penzance and enable subscribers to talk from Penzance to Wick, a distance of about 850 miles. At present Inverness is the farthest north town in Great Britain that can be telephoned to direct from London.

SERVICE RESTORATION FEE.—The Postmaster-General has decided that a fee of five shillings will in future be charged to telephone subscribers in every case in which delay in payment of an account leads to the withdrawal and restoration of telephone facilities. The cost entailed by temporary suspension of the service owing to non-payment has now reached a sum of about £25,000 per annum.

MANCHESTER'S NEW EXCHANGE.—Some 4,000 tons of steel will be required for Manchester's new main telephone exchange, the contract for building which has just been placed with a local firm, Messrs. Gerrard, of Swinton. It will take three years to complete, will occupy a floor space of six acres, and will cost altogether some £250,000; its ten floors will house a staff of 1,500. Three units of automatic apparatus, each dealing with 10,000 lines (30,000 lines in all) will be accommodated in the building, which has been designed by Mr. C. P. Wilkinson, of H.M. Office of Works.

SWANSEA DOCKS INSTALLATION.—In order to improve the telephone facilities at Swansea Docks, the Great Western Railway Co. is installing an enlarged branch exchange in the docks offices, which will enable all important parts of the docks to be linked up and provide for both dock traffic control and marine control. The existing exchange in the High Street will be abolished and the lines now connected therewith transferred to the new exchange.

United States.—NEW YORK TELEPHONE RATES.—The New York Telephone Co. has filed a supplemental complaint in the District Court in its action against the Public Service Commission and the Attorney-General of New York, seeking to restrain them from enforcing the rates last set by the Commission. The Company asks that the 10 per cent. surcharge on local rates in New York City allowed by Federal Judge John C. Knox, on May 1st, 1924, be increased to 35 per cent.; also that it be allowed to increase its charge within the State sufficiently to show a fair return on the value of its properties. The Company alleges that, after including the present 10 per cent. surcharge now applied to New York City, the rate level collected there is only 12.9 per cent. over the 1914 level, while living costs have increased 68.5 per cent. in the same period. The Company, after including money derived from the application of the surcharge of 10 per cent. in the city permitted by the terms of the injunction, has been able to earn only 3.96 per cent. on its property devoted to the service in the city and only 4.28 per cent. on its entire property used in the service throughout the State. The property, the Company asserts, has a value largely in excess of $500,000,000.—*Financial Times.*

Radio Notes.

Broadcast Wave-lengths.—SOME PROBABLE CHANGES.—The International Broadcasting Conference, first held at Geneva and recently at Brussels, has accepted the principle that the broadcast wave-band should be extended, the proposed limits being 200 and 600 meters inclusive. On account of shipping interference, no British station will be permitted to use a longer wave than 550 m., whilst 250 m. is probably the lowest limit that can be reached by the existing types of receiving sets; if it is found necessary to operate a British station below 250 m., at least a year's notice will be given, so that present sets need not be modified before March, 1927 (the Commission's findings will probably be published in March next). Moreover, the use of waves shorter than 300 m. is subject to the permission of the Post Office authorities. The Conference has adopted the principle of the allocation of exclusive and non-exclusive wave-lengths, and will respect the seniority of the longest-established stations so far as is possible. The *Evening News* says that Capt. P. P. Eckersley, chief engineer of the B.B.C., left for Brussels on January 11th, where the Conference met again, and is resigning his presidency of its technical section in order to retain an unbiased position.

India.—BROADCASTING COMPANY.—The Indian Radio Telegraph Co., which is building "beam" stations in connection with the Empire wireless chain, has been granted a licence by the Government of India to form a separate broadcasting company for India, with stations in Calcutta and Bombay. The capital of Rs.15,00,000 is all underwritten, it being an entirely Indian company with Indian capital. The *Daily Telegraph* expects that both stations will be working at the beginning of 1927. The income of the company will be 80 per cent. of the licence fees, and the remainder will go to the Government.

United States.—BROADCASTING HELPS FARMERS.—A complaint received by the State Railroad Board shows that the installation of radio receivers by farmers enables them to listen to the market and receive earlier returns, so that if the market falls they can sell their stored grain before the elevator operator learns of the change in price. The Board admits that the situation may be a difficulty for the elevator man, but says that the Board can do nothing in the matter.—*Reuter's Trade Service* (Bismark, N.D.).

Contracts Open and Closed.

(The date given in parentheses at the end of the paragraph indicates the issue of the "Electrical Review" in which the "Official Notice" appeared in our advertisement pages.)

Open.

Australia.—MELBOURNE.—March 16th. Postmaster-General's Department. Battery-charging power board equipment.*

March 23rd. Telephone switches.*

March 29th. State Electricity Commission. Transformers and auxiliary apparatus.*

Bath.—January 29th. Electricity Department. One 6,000-kW turbo-alternator, one water-tube boiler, mechanical stoker and economiser, and one 1,000-kVA transformer. (See this issue.)

Belgium.—ANTWERP.—February 1st. Municipal Council. Electric motor-driven centrifugal pump.*

Blackpool.—January 23rd. Electricity Department. One 2,500-kVA phase and frequency changer. (January 1st.)

Clitheroe.—January 20th and February 23rd. Corporation. Transformers, switchgear, and cable connection for sub-station; e.h.p. and l.p. cables, boxes, &c. (See this issue.)

Dewsbury.—January 23rd. Town Council. Reciprocating electrically-driven sludge pumps with motors and electrical equipment for Mitchell Laithes sewage disposal works. Specification from Mr. H. Dearden, borough engineer, Town Hall.

Edinburgh.—January 25th. Tramways Department. 25 air brakes suitable for electric tramway cars. Specifications from manager.

Grimsby. — January 30th. Electricity Department. 500-kW traction converting plant, sub-station e.h.p. switchgear, e.h.p. feeder and pilot cables. (See this issue.)

Ilkley.—January 20th. Electricity Department. Feeder cables, distribution cables, feeder pillars, and network boxes. (January 1st.)

India.—March 8th. India Store Department. 40 electric freight locomotives in connection with the G. I. P. Railway electrification. (See this issue.)

Liverpool.—January 28th. Electricity Department. Twelve months' supply of cables, meters, electrical sundries, electric lamps, &c. (See this issue.)

London.—METROPOLITAN ASYLUMS BOARD.—January 27th. Installation of electric lighting at the Darenth Colony, Dartford (approx. number of points, 2,300).

E.C. January 30th. Marryat & Place. 113,000 5-amp., 220-V tumbler switches. (January 8th.)

LONDON COUNTY COUNCIL.—January 25th. 4,425 tons of standard steel girder tramway track rails, fishplates and fish-bolts, and about 600 tons of conductor rails. Specifications from the Chief Engineer, Old County Hall, Spring Gardens, S.W.

ISLINGTON.—January 28th. St. Mary's Board of Guardians. Installation of electric lighting at Andover Row schools. (See this issue.)

Lye.—January 16th. Worcestershire E.C. Electric lighting installation, Valley Road and Orchard Lane schools. Mr. A. V. Rowe, county architect, 38, Foregate Street, Worcester.

Manchester.—January 29th. Electricity Committee. Wiring for electric lighting and power circuits, offices, stores, and workshops at the High Street depôt, Chorlton-on-Medlock. Specification from Mr. H. C. Lamb, manager, Electricity Department, Town Hall.

New Zealand.—WELLINGTON.—March 8th. New Zealand Government Railways. Two 25-h.p. variable-speed motors, one 125-kW motor-generator set and 17 400-V, 3-pole switches.*

Plymouth.—February 4th. Electricity Department. One 6,000-kW turbo-alternator, condenser, &c.; one 350-kW converter. (See this issue.)

Sheffield.—January 18th. Electric Supply Department. Erection of stores and ambulance room, on site of Neepsend generating station, Club Mill Lane. Particulars from Mr. S. E. Fedden, general manager and engineer.

South Africa.—JOHANNESBURG.—S.A. Railways and Harbours. February 25th. Electrically-operated hoists for raising, &c., heavy locomotives, electrically-driven geared winches, &c.*

CAPE TOWN.—January 27th. Electricity Department. Oil-cooled transformers.*

Tenterden (Kent).—January 27th. Board of Guardians. Electric lighting installation at the Institution. Master of the Institution.

Uruguay.—MONTEVIDEO.—February 26th. State Electricity Works. Diesel oil engine and a direct-coupled generator.*

Walthamstow.—January 27th. U.D.C. Electricity Department. Two water-tube boilers, mechanical stokers, economisers and pipework, &c. (January 8th.)

*Further particulars can be obtained at the Department of Overseas Trade (Inquiry Room), 35, Old Queen Street, S.W.1.

Closed.

Belgium.—The Société des Ateliers de Constructions Radiophoniques, of Brussels, has lately secured a contract for the supply of wireless apparatus for the aeroplane section of the Belgian Army.

Bradford.—Tramways Committee.

Three railless vehicles, with one spare set of equipment (£4,913).—Associated Equipment Co., Ltd.
Three ditto, and spare equipment (£5,040).—Richard Garrett & Sons, Ltd.
50 chrome steel axles (£286).—Vickers, Ltd.

Electricity Committee. Accepted:—

Supply and erection of radiant heat superheater at Valley Road works.—Power Speciality Co., Ltd.

Burton-on-Trent.—Electricity Committee. Accepted:—

Three 50-kVA transformers and three 100-kVA transformers (£847).—Metropolitan-Vickers Electrical Co., Ltd.

Glasgow.—Corporation. Accepted:—

Conversion of two existing service lifts at Govan Town Hall into electrically-controlled lifts (£106).—A. & P. Steven, Ltd.

Irish Free State.—The following contracts were among those placed by the Controller of Stores, Posts and Telegraphs, Dublin, from November 23rd to December 21st, inclusive:—

Cable.—Siemens-Schuckert (Ireland), Ltd., and Routledge & Co.
Electric lamps.—E. C. Handcock; Sphinx Electric Supplies (Ireland), Ltd.
Bronze and copper wire.—W. F. Dennis & Co., Ltd.
—*Irish Builder and Engineer.*

Lamp Contract.—The Admiralty has placed a contract for carbon-filament lamps with the Edison Swan Electric Co., Ltd.; and the British Thomson-Houston Co., Ltd., has received a six months' contract for the supply of "Mazda" lamps from the Great Northern Railway Co. (Ireland), Ltd.

Leeds.—Electricity Committee. Accepted:—

Supply of transformers for two years.—British Electric Transformer Co., Ltd.
Cables.—Enfield Cable Works, Ltd. (£1,491); W. T. Henley's Telegraph Works Co., Ltd. (£1,358).

Leicester.—Tramways Committee. Accepted:—

Special trackwork in manganese steel (£1,999).—Hadfields, Ltd.

London.—METROPOLITAN ASYLUMS BOARD.—Works Committee.

Renewal of electric lighting cables at Brook Hospital:—

T. Clarke & Co., Ltd. (Accepted.)	**£430**
G. E. Taylor & Co.	460
Riddle & Goddard, Ltd.	480
Toy & Winslow	546
V. G. Middleton & Co., Ltd.	575
Read & Partners, Ltd.	695

HACKNEY.—Electricity Committee. Recommended:—

Two 10-ton overhead travelling cranes (£407).—Herbert Morris, Ltd.

SOUTHWARK.—Electricity Committee. Recommended:—

Reconstruction of generating set (£5,136).—Fraser & Chalmers, Ltd.

Manchester.—Housing Committee. Accepted:—
Electric lighting installation at houses on the Openshaw estate.—Armstrong and Co. On the Withington estate.—A. Spreadborough.

Marlborough.—Town Council. Accepted:—
Conversion of street lamps for electric lighting (£591).—James Bros.

Oldham.—Electricity Department. Accepted:—
Three 12,500-kW turbo-generator sets and condensers for the new power station.—Metropolitan-Vickers Electrical Co., Ltd.

Portsmouth.—Electricity Committee.
Four carbon-dioxide recorders (£340).—Jas. Gordon & Co. (Accepted.)
Cables (£946).—Johnson & Phillips, Ltd. (Recommended.)

Salford.—The Council on January 7th accepted the tender of the Nederlandsche Kabelfabrick, of Delft, Holland, for the supply of cable to the Electricity Committee for £1,792. The lowest offer by a British firm was £717 more than that of the Dutch company. Inquiries were made as to whether the conditions of employment under the Dutch firm were satisfactory, and no contrary report was received. Some opposition was raised to the order being given to a Dutch firm, to which it was replied that trade was reciprocal, and if there was no buying abroad on the part of this country we could not sell goods abroad.

Shrewsbury.—Electricity Committee. Recommended:—
600-b.h.p. 6-cylinder 4-cycle heavy oil engine, 400-kW Rees Roturbo generator, switchboard panel, 8-ton crane, &c. (£8,137).—Belliss and Morcom, Ltd.

Stockton-on-Tees.—Board of Guardians. Accepted:—
Installing electric lighting at Portrack Lodge (£392).—T. B. Watson and Sons, Ltd.

Torquay.—The Electricity Committee quotes £2 5s. per house for wiring 100 houses now being erected by the Newton Abbot U.D.C. at the Broadlands estate.

Woolwich.—Town Council. Accepted:—
Cables in connection with the bulk supply of electricity to Erith and Bexley (£13,261).—Standard Telephones & Cables, Ltd.

Worcester.—City Council. Accepted:—
One 6,000-kW turbo-alternator, with accessories (£23,758).—British Thomson-Houston Co., Ltd.
Continuous-flow condenser (£6,200).—G. & J. Weir, Ltd.

Forthcoming Events.

Institution of Engineering Inspection.—Friday, January 15th. At the Royal Society of Arts, John Street, Adelphi, W.C. At 7.30 p.m. Paper on "The Characteristics of Electric Lamps in Relation to their Testing," by Messrs. B. P. Dudding and G. T. Winch.

Institution of Mechanical Engineers.—Friday, January 15th. At the Institution, Storey's Gate, S.W. At 7 p.m. Discussion on "Novelties at the 1925 Engineering Exhibition."

Manchester Electro-Harmonic Society.—Friday, January 15th. At the Albion Hotel, Piccadilly, Manchester. Concert.

Electrical Development Association Conferences.—Friday, January 15th. At Caxton Hall, Westminster, S.W. Lecture on "Suggestion and Auto-Suggestion in Salesmanship," by Mr. Ll. B. Atkinson.

Electrical Trades Commercial Travellers' Association.—Friday, January 15th. At E.L.M.A. Lighting Bureau, 15, Savoy Street, W.C.2. At 7 p.m. Lecture, "Demonstration of Lighting," by Mr. W. E. Bush.

Salford Technical and Engineering Association.—Saturday, January 16th. At the Royal Technical College. At 7 p.m. Presidential address by Mr. J. Morris.

Faraday Society.—Monday, January 18th. At Burlington House, W. At 5.30 p.m. Ordinary meeting.

Junior Institution of Engineers (North-Western Section).—Monday, January 18th. At the Manchester Geographical Society, 16, St. Mary's Parsonage. At 7.30 p.m. Lecture on "The Importance of the Selling Aspect of Production Planning," by Mr. W. D. Adamson.

Royal Institution.—Tuesday, January 19th. At 21, Albemarle Street, W. At 5.15 p.m. Lecture on "X-rays and Living Matter," by Dr. J. A. Crowther.
Friday, January 22nd. At 9 p.m. Lecture on "The Work of the Davy-Faraday Research Laboratory," by Sir William Bragg.

Paisley Association of Engineers.—Tuesday, January 19th. At the Paisley Technical College. At 7.30 p.m. Lecture on "The Spectrum Visible and Invisible," by Principal A. McLean.

Association of Mining Electrical Engineers (London Branch).—Tuesday, January 19th. At the Junior Institution of Engineers, 39, Victoria Street, S.W. Paper on "Rescue Apparatus for Mines," including demonstration of certain apparatus by Messrs. Siebe Gorman, Ltd.

(South Wales Branch).—Saturday, January 16th. At Cox's Café, Queen Street, Cardiff. At 6.30 p.m. Annual dinner. Visit of the president, Mr. Theodore Stretton.

Electrical Contractors' Association.—Tuesday, January 19th. At the Trocadero, Piccadilly Circus, W.1. At 6.30 for 7 p.m. Annual dinner.

Edinburgh Electrical Society.—Wednesday, January 20th. At the Royal Scottish Society of Art, 117, George Street. At 8 p.m. Paper on "Maintenance," by Mr. J. M. Couch.

Electrical Power Engineers' Association (West Yorks. Section).—Wednesday, January 20th. At the Cinema Exchange Theatre, Queen's Arcade, Briggate, Leeds. At 7 p.m. Paper on "Boiler Plant Efficiency: Some Practical Considerations," by Mr. B. Samuels.

Institution of Electrical Engineers.—Thursday, January 21st. At the Institution, Victoria Embankment, W.C.2. At 6 p.m. Paper, "Notes on the Testing of Static Transformers," by Messrs. J. L. Thompson and H. Walmsley.

(Irish Centre, Dublin).—Thursday, January 21st. At Trinity College, Dublin. At 7.45 p.m. Faraday Lecture on "Illumination and Light," by Mr. A. P. Trotter.

(Mersey and North Wales (Liverpool) Centre).—Monday, January 18th. At The University, Liverpool. At 7.30 p.m. Faraday Lecture on "Illumination and Light," by Mr. A. P. Trotter.

(North-Western Centre).—Tuesday, January 19th. At the College of Technology, Manchester. At 7.30 p.m. Faraday Lecture on "Illumination and Light," by Mr. A. P. Trotter.

(North-Midland Students' Centre).—Tuesday, January 19th. At the Hotel Metropole. At 7 p.m. Address by the chairman of the Centre, Mr. S. Derwen Jones.

(London Students' Section).—Friday, January 22nd. At the Institution, Victoria Embankment. At 6.15 p.m. Paper on "Switchgear," by Mr. C. F. George.

Institution of Electrical Engineers—(*continued*).

(East Midland Sub-Centre).—Tuesday, January 19th. At the College, Loughborough. At 6.45 p.m. Paper on "Justifiable Small Power Plants," by Mr. A. B. Mallinson.

(Sheffield Sub-Centre).—Wednesday, January 20th. At the Royal Victoria Hotel, Sheffield. At 7.30 p.m. Short addresses on "Regulations," by Messrs. G. H. Nelson, H. W. Walker, D. M. Rait, and D. H. Davies.

(Tees-side Sub-Centre).—Monday, January 18th. At the Cleveland Technical Institute, Middlesbrough. At 7.15 p.m. Informal discussion on "The Isolation, Location and Repair of Faults," to be opened by Messrs. E. E. Dunn and W. S. Ramsdale.

Illuminating Engineering Society.—Thursday, January 21st. At the Royal Society of Arts, John Street, Adelphi, W.C. At 7 p.m. Discussion on the "Lighting of Coal Mines," to be opened by Mr. E. Farmer.

Institution of Production Engineers.—Friday, January 22nd. At the Society of Motor Manufacturers, Ltd., 83, Pall Mall, S.W. At 7.30 p.m. Paper on "Features of Machine Tools which make for Increased Production," by Mr. G. W. Rawlings.

Physical Society of London.—Friday, January 22nd. At the Imperial College of Science, South Kensington, S.W. At 5 p.m. Ordinary Scientific Meeting.

The "Electrical Review" Service Department.

INQUIRIES must be accompanied by a stamped addressed envelope.

We should be glad to learn the names and addresses of makers of the following:—

TAIFUN electrical ventilators.
BEAR portable punches.

Notes.

Appointments Vacant.—Assistant telegraph superintendent (Rs. 500 per cal. month), for the Burma Railways Co., Ltd.; female cooking demonstrator and show-room attendant, for the Cardiff Corporation Electricity Department; plumber-jointer, for the Penmaenmawr U.D.C. Electricity Department; electrical engineer and electrical assistant, for the Bettws-y-Coed U.D.C. Electricity Department; lecturer in preliminary technical studies (£400), for the Cape Technical College; plumber-jointer for the Stepney Corporation Electricity Department. (See our advertisement pages to-day.)

The British Association.—This year's meeting of the British Association for the Advancement of Science is to be held at Oxford from August 4th to 11th under the presidency of the Prince of Wales. The name of the president of the Engineering Section is to be announced later. Dr. A. Fowler, Research Professor of the Royal Society, is to be president of the Mathematics and Physics Section; Dr. J. F. Thorpe, Professor of Organic Chemistry at the Imperial College, is to be president of the Chemistry Section; and Sir Josiah Stamp is to be president of the Economics Section.

Local Societies.—BIRMINGHAM ELECTRIC CLUB.—The following officers for the year 1926 were appointed at the annual meeting, held on December 18th:—President, Mr. A. E. Cunningworth; hon. treasurer, Mr. D. G. Brooks; hon. secretary, Mr. J. M. Dunkley; hon. social secretary, Mr. F. W. Martin.

LIVERPOOL ENGINEERING SOCIETY.—The annual dinner will be held at the Midland Adelphi Hotel, Liverpool, at 7 o'clock, on Thursday, February 4th. The Lord Mayor of Liverpool has accepted an invitation. Tickets (exclusive) will be twenty shillings each, and the dinner list will be closed on Saturday, January 30th.

Electrical Development.—In an interesting "talk" on this subject broadcast from the London station on Tuesday evening, Mr. D. N. Dunlop recalled that on a visit to an engineering works, Lord Kelvin once remarked to him: "I place no limit on the possibilities of the future; if man will only learn to be unselfish enough to be trusted with Nature's secrets." He proceeded to refer to the marvellous development of engineering since the time when James Watt occupied his little attic workshop, and declared that national progress depended more upon the use of electricity than on any other factor. In Watt's time men worked with their hands, and their horizon was restricted; now machinery did so much for them that few could realise what the world would be like without steam and electricity—such a city as London could not even exist. Power entered into every phase of their daily life—but they were not yet in a position to use electricity as freely as they should. The Government intended to introduce legislation to foster electrical development; all political parties were agreed as to its necessity, and such legislation, if effective, would confer countless benefits on the people, relieving them from drudgery and enabling them to develop those qualities which would make them a finer and nobler race.

Legal.—TELEPHONE MFG. Co., LTD., *v.* WM. SOUTTER & SONS, LTD.—Mr. Justice Greer, in the King's Bench Division on January 11th, heard an action by the Telephone Manufacturing Co., Ltd., against William Soutter & Sons, Ltd., of Birmingham, an action by the plaintiffs to recover from the defendants damages for alleged breach of warranty and misrepresentation.

Defendants counterclaimed for loss, which they alleged they had sustained through the cancellation of the agreement entered into between the parties in June, 1924, by which the plaintiffs were appointed the defendants' sole distributing agents for the sale of "Soutterware," a description of ironmongery manufactured by the defendants.

The plaintiffs' case was that the defendants represented that their sales amounted to some £30,000 per annum, upon the strength of which they spent large sums of money in advertising and getting the distributing organisation into working order, but that the defendants had dealt with the deliveries in such a way that orders were lost and plaintiffs were compelled to cancel the agreement. They accordingly asked for cancellation of the agreement and damages for the alleged neglect by the defendants to carry it out.

In the result, Mr. Justice Greer decided to send the case to an Official Referee, and made an order accordingly, the plaintiffs, through their counsel, agreeing that any charge of fraud they had originally made should be unreservedly withdrawn.

The Accident at Barking Power Station.—Referring to the accident which took place at the power station of the County of London Electric Supply Co., Ltd., at Creeksmouth, on December 14th, we have received the following particulars from the Company:—About 12 o'clock noon on Monday, December 14th, 1925, when the second line of a 40,000-kVA compound set was being run up, the cover of the governor valve was dislodged and fell through the floorplates on to the feed-pump gallery below, other pieces of metal of small section being at the same time scattered throughout the engine room in the vicinity of the turbine. Fortunately, the damage to the other equipment in the station was confined to the jamming of the governor gear on the other line of the same turbine, which was on load at the time. Three men (the driver, a pump attendant, and an employé of one of the contractors) received injuries, one of them having both legs fractured. The men were removed to the Poplar Hospital, and are reported to be making good progress towards recovery; in fact, two of them will, it is expected, be able to leave the hospital very soon.

The Company's supply was not interrupted, and the effect on the system was only slight, thanks to the Barking power house being interconnected with other generating stations.

The cause of the trouble has not so far been fully diagnosed, as, until the men concerned are fit to give evidence, those who are carrying out the investigations will be unable to arrive at any final conclusion.

From the foregoing it will be seen that the parts involved were of minor importance, and that the reports circulated in the first instance were exaggerated.

Electrical Association for Women.—The Association is arranging a musical afternoon at the Æolian Hall on January 23rd, when the application of electricity to the production of good music for the home will be fully demonstrated. Members and guests will be received at 3 p.m. by Mrs. Wilfred Ashley (vice-president of the Association), and later in the afternoon Mr. H. V. Spanner, Mus.Bac., F.R.C.O., a blind musician, will lecture on "The Place of Music in the Home."

The Economy of Railway Electrification.—The Interstate Commerce Committee is conducting an inquiry into the financial condition of the Chicago, Milwaukee and St. Paul Railway, and the *Electrical World* states that Mr. R. Beeuwkes, the company's electrical engineer, recently gave evidence showing that since electrical operation began, in 1916, up to the end of 1923 a saving of $12,400,000 had been effected. The total cost of electrification was less than $16,000,000. Mr. Beeuwkes estimated that it would take about two years to electrify the remaining 212 miles of the mountain section of the railway, if there were no interruptions. His opinion was that the company had been fully justified in the result of the electrification already carried out, and he believed that it would be profitable to convert the remaining stretch.

International Electrotechnical Commission.—The following important matters will come before the I.E.C. Advisory Committee at the meetings to be held in New York from April 13th to 22nd, 1926:—

1. Preparation of Part 2 of International Specification for Electrical Machines. (Large machines.)
2. General discussion on rating of electrical machinery, including presentation of papers by experts from various countries.
3. Preparation of a specification for traction motors.
4. Revision of the I.E.C. Publication 29—Hydraulics, including proposals for an International Specification for Hydraulic Turbines.
5. Preparation of an International Specification for Steam Turbines for driving Electrical Plant.
6. Completion of the list of International Graphical Symbols.
7. Preparation of an international basis for the testing of insulating oils.
8. Approval of the international standards for lamp caps and holders.
9. Confirmation of the list of international standard high pressures.
10. Preparation of international standards for high-pressure tests.
11. Preparation of an international code of rules and regulations for overhead lines.
12. Preparation of an international code of terminal markings.
13. Preparation of an international electrical vocabulary.
14. Some additional minor matters.

It will be seen that the questions under discussion at this meeting are of vital industrial interest to this country. Delegates will be present from all the principal countries, and information with regard to the meeting can be obtained from the Secretary of the British Electrotechnical Committee.

Women's Engineering Society.—A visit has been arranged for Monday, January 25th, to the Research Laboratories of the General Electric Co., Ltd., at Wembley. Those wishing to join the party should notify the secretary of the Society not later than January 20th. On February 12th Miss E. M. Kennedy will lecture on "Some Problems of the Machinery Market," and on March 12th Mrs. G. Shaw Scott, B.Sc., will lecture on "Women's Contribution to Metallurgy."

Tramway Equipment for New Zealand.—We learn from our New Zealand correspondent that new machinery is now on its way from England to that country for the Thorndon and Karori tramway sub-stations. It consists of automatic supervisory gear which will enable the whole of the plant to be controlled by an operator at the main station by means of an instrument of the automatic telephone type. This plant was described in the ELECTRICAL REVIEW for October 16th, 1925, page 621.

Institution Notes.

Institute of Metals.—The Institute increased its membership last year from 1,571 to 1,692. Such progress at a time of acute depression in the engineering and metal trades indicates that manufacturers are anxious to avail themselves of the latest scientific knowledge of metals with a view to meeting foreign competition. A ballot for the election of members and student members will take place on February 24th. Persons elected will be entitled to membership advantages for the extended period ending June 30th, 1927. Particulars of these advantages, and membership application forms, can be obtained from the secretary.

Institution of Heating and Ventilating Engineers (Inc.).—At a meeting held on January 6th, a paper was read on heating with hot water by Mr. J. R. Preston, who said that systems dispensing with mechanical power had in this country given way to electrically- or steam-driven pumps, largely because of the almost universal supply of electricity.

Our Personal Column.

(Electrical men are invited to enable us to keep readers of the "Electrical Review" posted concerning their movements).

Mr. FRANK GILL, M.Inst.C.E., M.I.E.E., has found it necessary, owing to an important engagement abroad, to resign his position as President of the National Association of Supervising Electricians. This decision is widely regretted, but the Association has been fortunate in securing as President Mr. A. M. Sillar, M.Inst.C.E., M.I.E.E., M.I.Mech.E. Mr. Sillar was formally introduced to the members at a meeting on January 5th, held at the Junior Institution of Engineers, 39, Victoria Street, London, S.W.1, by Mr. A. H. Dykes, M.Inst.C.E., M.I.E.E., a past President of the N.A.S.E. He will give his presidential address on the opening of the new session in October next. An account of the career of Mr. Sillar was published, together with his photograph, in the ELECTRICAL REVIEW for December 15th, 1922, in connection with his presidency of the Association of Consulting Engineers.

The *Daily Chronicle* states that Mr. N. ASHBRIDGE, B.Sc., A.M.Inst.C.E., has been appointed assistant-chief-engineer of the B.B.C. During the war he served with the Royal Engineers in France, and afterwards joined the Marconi Company as head of the Writtle experimental section, which he took over from Captain Eckersley when the latter joined the B.B.C. in 1923.

Dumfries Town Council has appointed Mr. W. ERSKINE as electrician for the ensuing year.

Kendal Town Council has increased the salary of the electrical engineer and manager by £44 to £450 per annum.

Subject to the proviso that no increase be granted to any official whose salary was advanced last year unless he has been promoted or has undertaken additional official responsibilities or duties, Manchester Corporation has accepted the following recommendation:—Traffic superintendent, tramway department, £981 to £1,000; permanent way engineer, superintendent, stores superintendent, parcels superintendent, chief claims clerk, carworks department, all of the tramway department, each from £703 to £750.

On January 6th the Liverpool City Council approved the appointment of Mr. H. A. W. WILLIAMS as turbine house superintendent in the electricity supply department at a salary of £425 per annum.

Beckenham Urban Council has decided to increase the salary of the electrical engineer and manager from £600 plus bonus, to £850 per annum, rising by annual increments of £25 to £1,000, as from April 1st, 1925.

In connection with the taking over of the local electricity undertaking by the Dalkeith Town Council, Mr. H. SMITH, at present employed at the station, has been appointed resident engineer at £286 per annum.

SIR GEOFFREY CLARKE, C.S.I., has been appointed to the board of the Telegraph Construction & Maintenance Co., Ltd., in the place of Mr. F. J. Lucas, who recently retired. He will act as joint managing director.

SIR A. HENRY MCMAHON, G.C.M.G., &c., has accepted a seat on the board of the Oriental Telephone & Electric Co., Ltd., and will take the chairmanship, in place of the late Sir George S. Gibb.

The *Board of Trade Journal* announces that, owing to ill-health, Mr. W. G. WICKHAM, Senior Trade Commissioner in South Africa, is relinquishing his position. Mr. N. ELMSLIE, Trade Commissioner in New Zealand, has taken up duty at Johannesburg pending the appointment of a successor to Mr. Wickham.

Science reports that DR. HARRIS J. RYAN, professor of electrical engineering at Stanford University, has been awarded the Edison Medal for the year 1925 by the Edison Medal Committee of the American Institute of Electrical Engineers "for his contributions to the science and the art of high-tension transmission of power."

On Friday last the Lancashire and Cheshire Tramways Authorities Council presented a grandfather clock and a trio of silver bon-bon dishes to Mr. JOHN BARNARD, M.B.E., the Bolton manager, to commemorate his silver wedding, and in recognition of his services as hon. secretary to the Council since its establishment.

Obituary.—MR. CONRAD W. COOKE.—We regret to record that Mr. Conrad William Cooke, M.I.E.E., passed away at Hampstead on Sunday last in his 83rd year. The deceased gentleman was for many years prominent in the consulting and electrical engineering world, but in recent times his activities did not bring him into such close touch with electrical affairs and those connected with them. It is by the older generation that he will be especially remembered, for it was just over fifty years ago (1872), after coming to London and entering into the partnership Whieldon & Cooke, engineers, of Lambeth, that, according to the published records, he introduced and made the first dynamo-electric machine (Gramme), and designed and installed the first electric light on the Clock Tower of the Houses of Parliament, which is stated to have been the first searchlight. He was joint author with the late Mr. James Dredge, of the celebrated work "Illuminating Engineering," and he was a regular contributor to the pages of our contemporary *Engineering* on electrical and physical subjects. He was very closely interested in the introduction of the incandescent mantle system of gas lighting. Mr. Conrad Cooke reported for *Engineering* the proceedings of the British Association at Glasgow in 1876, when Lord Kelvin described the invention of the telephone. He lectured at the Society of Arts in 1879 and gave them the first account of the Edison loud-speaking receiver. He was a witness for the defendants in the telephone case at Edinburgh, when it was first explained that the tilted diaphragm to the iron box receiver illustrated by him in *Engineering* and since incorporated in most text books, though accurate as regards the instrument shown by Lord Kelvin, was not in accordance with the design of the inventor. He also appeared as an expert witness in later cases, but took no active part in the development of telephony. As an expert witness in electrical and other technical cases in the Courts, his services were in frequent demand, while he was also a member of the Juries of many International Exhibitions. His numerous interesting additions to literature included a memoir of Gilbert of Colchester, and together with the late Prof. S. P. Thompson, he founded the Gilbert Club in the year 1889. The funeral service took place at Hampstead Parish Church on Wednesday, followed by cremation at Golders Green.

MR. C. G. DAY.—The death took place on January 2nd, of Mr. Colin George Day, who had for 17 years been secretary of Messrs. Mirrlees, Bickerton & Day, Ltd., of Stockport, of which his brother, Mr. Charles Day, is the managing director. He was 61 years of age.

MR. J. A. BRINELL.—The death recently occurred in Stockholm, at the age of 76 years, of Mr. J. A. Brinell, whose name was known throughout the world in connection with his ball hardness-testing machine. He also took a prominent part in metallurgical development in Sweden.

Will.—The late Mr. A. W. GATTIE left £1,208.

New Companies Registered.

Ormond Engineering Co., Ltd. (210,790).—Private company. Registered December 31st. Capital, £25,000 in £1 shares. Objects:—To adopt an agreement with E. J. L. Defosse, and to carry on the business of screw manufacturers and manufacturers of wireless components and accessories formerly carried on by the vendor as the Ormond Engineering Co. at 203, Pentonville Road, and 36, Whiskin Street, London. The directors are:—E. J. L. Defosse, 266, Green Lanes, Stoke Newington, N., engineer (permanent governing director and chairman); O. H. Delfosse, 21, Queen's Court, Wembley Park, engineer; Evelyn H. L. Townsend, 16, Claremont Square, Clerkenwell, secretary. Qualification, £100. Remuneration (except governing director) as fixed by the company. Registered office: 3, Throgmorton Avenue, E.C.

Bowden & Higlett, Ltd. (210,922).—Private company. Registered January 6th. Capital, £3,000 in £1 shares. To acquire the business of electricians and electrical engineers and mechanics carried on in Guildford as Bowden and Higlett, recently purchased by R. H. Tribe. The permanent directors are:—R. H. Tribe, Highfields, Nightingale Road, Guildford, builder; C. G. Howard, Kingsby, Bray Road, Guildford, electrician (managing director). Qualification, £50. Remuneration as fixed by the company. Solicitors: Smallpiece & Merriman, Guildford.

Official Returns of Electrical Companies.

Victoria Electrical (Manchester), Ltd.—R. N. Brookes, C.A., of 6, Princess Street, Manchester, was appointed receiver on December 28th, 1925, under powers contained in debenture dated January 28th, 1922.

Medway's Safety Lift Co., Ltd.—Second debenture dated December 22nd, 1925, to secure all moneys due and to become due not exceeding £10,000, charged on the company's undertaking and property, present and future, including uncalled capital. Holder:—J. and E. Hall, Ltd., 10, St. Swithins Lane, E.C.4.

Charles Fitz-Hugh, Ltd.—Particulars filed of £500 debentures authorised December 23rd, 1925, charged on the company's undertaking and property, present and future, including uncalled capital, the whole amount being now issued.

C. & J. Arrigoni & Co., Ltd.—Particulars filed of £100 debentures authorised December 4th, 1925, charged on the company's undertaking and property, present and future, including uncalled capital, the whole amount being now issued.

Oriental Telephone and Electric Co., Ltd.—Satisfaction to the extent of £6,876 on December 22nd, 1925, of debenture stock covered by trust deed dated June 28th, 1905, and a supplemental deed of acknowledgment dated June 12th, 1907, securing £200,000.

City Notes.

Reports and Meetings of Electrical Companies, Dividend Results, &c.

International Automatic Telephone Co., Ltd.

An extraordinary general meeting was held on January 5th, when the proposals outlined in our issue of December 11th (p. 946) were considered. Sir Alexander Roger (chairman), who presided, said that the proposals marked an important stage in the company's progress. The telephone field was engaging the attention of new interests, and fresh efforts were being made all over the world to accelerate the development of the telephone. In order for the company to keep abreast of its responsibilities and opportunities it was necessary to raise fresh capital. The association of the company and the Automatic Telephone Mfg. Co. had resulted in a period of marked prosperity for them both; this association was made possible by the co-operation and assistance of Messrs. Theodore Gary and Co., who, as a consideration, were given an option to purchase 360,000 ordinary £1 shares of the company at 30s. each. The directors considered that the removal of this option would be in the interests of the shareholders. It was accordingly proposed that, in lieu of the option, Messrs. Gary & Co. should be offered, in the first instance, 360,000 of the 640,000 new ordinary shares which were to be created, at the price of 30s. per share. It was the intention of the board to issue in the near future shares, numbering probably 60,000 and not exceeding 140,000, in connection with certain trade investments already arranged or being negotiated. It was also necessary to alter the articles of association. The chairman then formally moved the resolutions; they were seconded by Mr. D. Sinclair, vice-chairman, and unanimously adopted. At a subsequent meeting of ordinary shareholders the resolutions were sanctioned and assent was given to the variation of their rights.

Vickers, Ltd.

The resolutions passed at the meeting held on December 17th (*vide* ELECTRICAL REVIEW, December 18th, p. 989, and December 25th, p. 1026) came before an extraordinary meeting on January 5th for confirmation. Mr. Douglas Vickers (chairman) presided, and said that the following shareholders had been invited to confer with the company's advisers:—Mr. Albert, senior managing director of George Senior & Sons, Sheffield; Mr. C. E. Siddall, chairman and managing director of the Sheffield Forge & Rolling Mills Co.; and Sir John F. Beale, a director of Guest, Keen and Nettlefolds, Ltd., and other companies. The resolutions were then formally moved. These, it will be remembered, provided for the reduction of the ordinary capital, the reorganisation of the board, the formation of three separate management boards, the winding-up of unremunerative subsidiaries, &c.

A shareholder endeavoured to move a resolution declining to sanction the proposed reduction of capital and appointing a committee of investigation to examine the financial transactions of the company. He was, however, ruled out of order and the original resolutions were confirmed by a large majority.

Electrolytic Zinc Co. of Australasia, Ltd.—A dividend at the rate of 12 per cent. has been declared on the preference and ordinary shares in respect of the half-year ended December 31st last.

The annual meeting was held at Melbourne on October 27th, when Mr. W. L. Baillieu, the chairman, said that apart from the zinc industry the company had been able to satisfy all the demands made upon it for superphosphate. This product was of a high uniform standard and the business was rapidly expanding. The directors had been able to increase the dividend and the financial position was such that there was every prospect of maintaining the rate.

Stock Exchange Notices.—Dealings in the following securities have been specially allowed by the Stock Exchange Committee under Rule 159:—

Crittall Manufacturing Co.—22,535 ordinary shares of £1 each, fully paid, Nos. 427,466 to 450,000.

Application has been made to the Committee to allow the following to be officially quoted:—

Montreal Tramways Co.—$17,826,500 series "A" 30-year 5 per cent. general and refunding mortgage sinking fund gold bonds, Nos. M1 to M8,599 and M8,601 to M15,902 ($1,000), D1 to D2,750 ($500), and C1 to C5,505 ($100).

Chili Telephone Co., Ltd.—An interim dividend of 3s. per share, free of tax, has been declared.

Stocks and Shares.

MONDAY EVENING.

STOCK Exchange markets are once more unsettled by the apprehension of a possible rise in the Bank Rate. So many millions of money have been required during the past few weeks for the purposes of new issue flotations that it has been fairly apparent to many people that the drain of money could not go on indefinitely without the money market being affected sooner or later. A great deal of the capital required during the past couple of months has been for interests outside the United Kingdom; British money has flowed into foreign loans raised without any proviso that the cash, or part of it, should be employed in this country for the encouragement of trade.

In these columns we have suggested that there is plenty of scope for employment of considerable sums of money in the various branches connected with electrical work, railway power, equipment, &c., and that the investment of British money in bonds and shares of American utility companies is a policy which has disadvantages from the patriotic point of view. Since the embargo was removed by the Government from the issue of foreign loans in this country, there has been a not unnatural scramble on the part of promoters to raise as much money as possible through the foreign issues which are so readily absorbed by British investors. The experience of the past few days is alone sufficient to emphasise the readiness with which the British investor subscribes to any stocks, foreign or otherwise, that appear to him to be cheap.

The electricity supply market is firm, with rises in several of the London shares. Kensingtons are ¼ better at 13½, St. James's have hardened to 15⅝, and Westminsters are 2s. up at 2½. Charing Cross strengthened to 49s. 6d.; Chelseas to 2 3/16. Countys are once more over £3. Deduction of the dividends from prices of several of the preference shares is being recovered, and the market is firm throughout. The warning is raised in several quarters against shareholders expecting too much from their boards of directors in regard to forthcoming dividends. Some of the financial guides maintain that prices in this section are already too high, as compared with those that rule for other sound industrials. Certainly the existing level of shares in home electricity supply companies offers temptation to those who recognise the discretion of taking a good profit upon the original purchase prices, but, in spite of this, the outlook is sufficiently promising to justify proprietors in keeping at any rate the greater part of their shares, though they may elect to sell a proportion in order to lessen the cost of the remainder.

The Home Railway market has been better, and the Undergrounds hold their improvements, although the stocks of the steam companies show a tendency to dwindle. The strength of the market is ascribed to dividend anticipations that, at the moment, are rather more optimistic than they have been of late. Underground "A" shares rose to 7s. 6d. Metropolitans and Districts are both better.

International Telephones are a strong market at 45s. Since the re-arrangement of the company's agreement with the American firm of Messrs. T. Gary & Co., the price of Internationals has gone sharply ahead. Automatics are 2s. 6d. up at 53s. 9d. Marconis have developed a firmer tendency, and the price of the parent shares is 1/16 better, at 26s. 3d. Marines are unchanged at 17s. 6d. Cable stocks exhibit little change.

Manufacturing shares are unusually quiet. The reaction in the price of raw rubber is deemed to be a bull point for the companies that use large quantities of the produce, but, in view of the likelihood of recovery in Mincing Lane, the investor in "equipment" shares prefers to go slowly as regards fresh purchases. Edison 5 per cent. debenture is quoted at 83 ex dividend, a price at which the yield on the money comes, once again, to a shade over 6 per cent. General Electrics remain at 29s. 3d. Babcock & Wilcox have strengthened to 51s. 3d. bid. The iron and steel market, with that for engineering shares, shows a disposition to improve: the argument is that prices can hardly be expected to go much lower than the existing range, and this suggests, of course, an expectation of recovery.

While Mexico Tramways fives have risen a point, Mexican Light & Power Firsts are again 1½ down. Brazilian Tractions put on a modest fraction; British Columbia deferred has regained the dividend taken off the price last week. Business in rubber shares has dwindled very appreciably, and the Stock Exchange as a whole is inclined to blame the Bank Rate uncertainty as being the cause for the quietude of trade that prevails in most of the markets round the House.

A Hospital Radio Installation.

A Large Igranic Receiving Outfit at the London Hospital.

IN connection with the equipment of hospitals in this country with broadcast radio receiving apparatus, under the *Daily News* scheme, for the entertainment of both patients and staff, the installation recently completed at the London Hospital is worthy of notice. As the hospital is the largest in the United Kingdom, a set of unusually large size had to be provided, it being capable of serving 1,000 listeners at different points.

The receiving apparatus, which has been designed and presented by the Igranic Electric Co., Ltd., is housed in an asbestos-lined hut on the roof of the institution. It employs 16 valves and is operated through the agency of relay mechanism

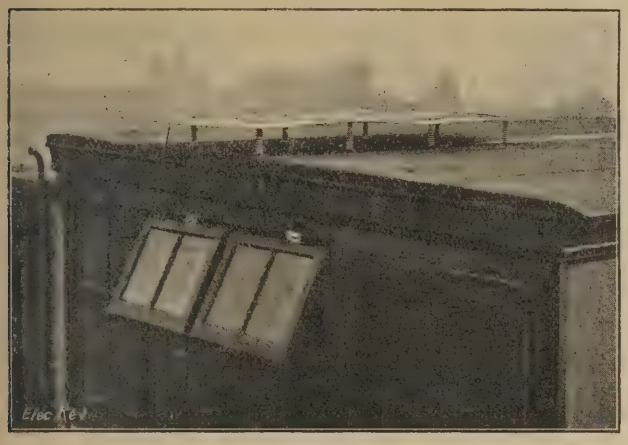

Fig. 1.—Plate Aerial on Roof.

controlled by a tumbler switch in the porter's lodge. The various wards have been wired into nine distinct circuits, eight of which supply 842 pairs of headpnc es, whilst the ninth actuates a series of loud-speakers in the children's wards.

The Receiver.—As indicated in fig. 1, a sheet of metal fixed to the roof of the hut serves as the aerial for an Igranic 6-valve super-heterodyne receiver (illustrated in fig. 2, with the glass covers removed), the wiring arrangement of which is similar in essentials to that of the standard model. By employing various combinations of terminals it is possible to use a variety of signal input circuits. Thus, either the recently developed twin-winding frame aerial, or a simple frame, may be used directly coupled or else *viâ* the intermediary of a two-circuit tuner. Alternatively, any form of open aerial may be used, either directly or variably coupled, as before. The comprehensive nature of these arrangements facilitates the treatment of any regional interference on the lines best suited to its elimination.

The initial valve (an Osram DH5, working at 60 volts) functions in the dual capacity of oscillator and rectifier, a capacitative balancing system permitting the signal-frequency and oscillator-frequency circuits to be worked without mutual interference. The use of this system not only dispenses with one valve, but also restricts the amount of locally-generated energy passed into the aerial circuit, so reducing the possibility of radiation to negligible terms.

This valve communicates with three stages of intermediate-frequency amplification, each of which employs a form of reactance-capacity coupling adjusted to a wave-length of some 6,000 metres. This wave-length would seem to be the most satisfactory choice when it is intended, as in this case, to effect reception from stations using waves up to 2,000 metres in length, for it implies a desirably substantial frequency difference between the two channels of signal acceptance, whilst the copper losses remain low and the unwanted electrostatic couplings are of high reactance.

Great importance attaches to the resonance curve of the intermediate-frequency amplifier, for it is said that in no other practical receiving system is there the same opportunity of maintaining the most satisfactory selective condition throughout the entire range of received signal wave-lengths.

In the instrument under review it has proved possible by proportioning the l.c. ratios and damping factors to effect a form of band filter which cuts off sharply at the outer limits of the useful sidebands emanating from the transmitter. This is the condition of maximum selectivity consistent with faithful telephony. The characteristics of the band filter are, of course, entirely independent of the signal frequency and remain unaffected by any change of signal wave-length, since the frequency at which amplification is conducted remains constant.

As the result of an extinction of limiting couplings between the intermediate-frequency stages, the designers have been able to cascade three Osram DE5B valves, working at 120 volts, and to employ their high M value to the maximum in each stage without instability or resorting to the deliberate introduction of losses as a means of suppressing undesirable oscillation. Indeed, so stable is the amplifier claimed to be that it has been possible to impart to the grids of the intermediate-frequency valves a negative bias of 1½ volts in order that no grid current shall flow and so encourage premature rectification and consequent distortion.

A novel arrangement is used to apply reaction to the amplifier when desired; the potential gradient between the grids of the first and second amplifying valves is controlled by means of a variable non-inductive resistance having a maximum value of one megohm. The third intermediate-frequency stage delivers to the final rectifier (an Osram DE5B working at 120 volts) the grid of which is maintained at a positive potential so as to stimulate the flow of grid current that is essential for cumulative rectification.

The single stage of note amplification of the super-het receiver is not included in the hospital set, since the latter is attached to a special power bank amplifier as shown in fig. 2.

Although, by virtue of the very high amplification available, the plate aerial proves effective for full-load reception from a number of stations, higher selectivity and responsiveness are obtainable when the patent frame aerial is employed. The latter is collapsible for portability and performs an interesting secondary function, for it eliminates interference set up by stations using wave-lengths in, or near, the band to which the intermediate-frequency amplifier is responsive. It embodies two geometrically parallel windings consisting of an equal number of turns, one winding being tuned to the signal frequency by means of a condenser in the receiver, while the other is wound in the opposite sense and not tuned. The two windings are so arranged in the receiver circuit that the arrival upon the frame of a widely non-resonant frequency results in the simultaneous formation of two potentials of equal voltage and opposite sign, a condition producing mutual cancellation and elimination of the long-wave interference to which super-heterodyne sets working on directly-coupled frame aerials have always been subject. On the other hand, when dealing with resonant frequencies the responsiveness of the tuned winding rises to a maximum, while that of the untuned winding remains low; hence there are no opposing effects and reception from desired stations is therefore in no way effected.

The Power Bank Amplifier and Distribution Scheme.—In the power bank amplifier the secondary winding of the input trans-

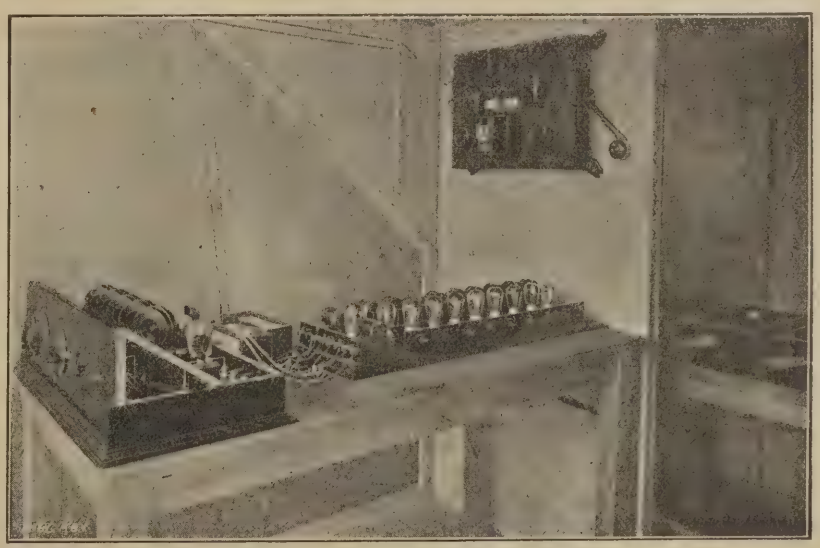

Fig. 2.—Super-heterodyne Receiver and Power Amplifier.

former is common to nine valves; the anode circuit of eight of them contains an output transformer, the secondary winding of which is earthed at its centre point in order to maintain the output leads at balanced potentials. The impedance of the various output circuits has been approximately equalised and it is such that, considered in relation to the anode impedance of the Osram LS5 valves, 7 to 1 step-down transformers were designed. Since the capacity of the line is reflected across the primary winding of its associated transformer inversely as the square of the ratio of transformation, it may be as high as 0.1 mfd, without seriously impairing the amplitude of the higher frequencies. This figure is not attained

at the London Hospital and even on the longest line there is no interference with the tonal balance.

The ninth valve delivers *via* an appropriate transformer to an Osram LS5A valve, the anode circuit of which is coupled through an output transformer to a number of Amplion loud speakers. An indication of the input voltage swings which are qualitatively permissible (and desirable to ensure a reasonable safety factor) is provided by the fact that a negative bias of 45 volts is imparted to the grid of each of the LS5 valves, while the grid of the LS5A valve is negatively biased to the extent of 120 volts. The anode current to all the valves in the power bank is supplied at a pressure of 300 volts.

The output lines are paired off and run in lead-covered cables, all the coverings being bonded and earthed to obviate induction effects. Each headphone circuit is sub-divided into four or five ward sub-circuits at appropriately placed junction boxes, and in the event of a local fault it is therefore possible to isolate any ward expeditiously without detriment to the main service. Some idea of the magnitude of the installation may be gauged by the fact that about 15 miles of lead-covered line had to be laid to carry the current from the radio hut to the bedside headphones and loud speakers in every part of the hospital.

Although primarily intended for reliable reception from the London and Daventry stations only, the plant is able to give a full-load service from a number of European broadcasting stations.

Batteries and Charging Mechanism.—The filaments of the receiver and power-bank valves require a total current of 10 amperes at 6 volts, while the combined anode requirements account for 150 milliamperes at 300 volts, a 3-ampere-hour accumulator providing the latter supply.

The batteries are housed in an isolated and separately ventilated section of the instrument hut. Practical considerations dictated the provision of two motor-generator sets for charging purposes and they are also installed in the battery compartment of the hut. No. 1 set has an output of 15 amperes at 10 volts, and No. 2 set delivers 0.3 ampere at 350 volts.

Since the apparatus has been designed to provide a possible 14-hour reception programme daily, it was necessary to adopt means of expeditiously conducting the charging operation; to this end the action of the motor generators is governed by Igranic automatic controllers. Directly the receiver is switched off, the controllers start the generators and the charging current, *inter alia*, drives a small mercury motor that communicates with an indicator which registers the extent to which the ampere-hour capacity of the batteries is satisfied. When the indicator is driven to the position denoting a complete charge, a relay is tripped and the charging circuits are broken. If the receiver should be switched on during the charging process, the generators will automatically stop and resume their task when the receiver is switched off.

The employment of this mechanical battery attendant, coupled with the fact that the two essential tuning adjustments of the receiver are normally fixed for reception from Daventry, eliminates the necessity for skilled attention.

Australian Trade and Industry.

The Growth of Home Production.

A REPORT upon the economic and commercial situation of Australia has been forwarded to the Department of Overseas Trade by Mr. R. W. Dalton, Senior Trade Commissioner in the Commonwealth.*

In his opening remarks Mr. Dalton says that in general conditions in Australia during the past 12 months (*i.e.*, to June, 1925), were very favourable and production was at a high level. Mention is made of the gradual drift of the small population of Australia to the large cities, and it is said that the development of manufacturing industries by a system of high protection has intensified this drift, and will probably continue to do so. This aspect of Australia's life is not without considerable interest and importance from an economic point of view, and it is also one which must be taken into account in the consideration of commercial organisations for the development of trade. In the early part of the year 1924-25 the financing of industry and shipment was attended by considerable difficulty; the position later improved and is now much easier. Regarding the general financial condition of the Commonwealth, Mr. Dalton states that at the last annual conference of the Associated Chambers of Commerce, a resolution was passed emphasising the paramount importance of the restriction of expenditure and public borrowing to reproductive public works. The resolution also deplored the action of the Government in treating as revenue that proportion of State loans which represented the amount of Customs duty paid by the State to the Commonwealth, on plant and machinery imported for State use.

Manufacturing Industries.

Statistics are given in the report indicating the rapid development of manufacturing industries in Australia during the last few years, and the undoubted desire to intensify this development. It is shown that the number of factories increased from 18,023 in 1921-22 to 20,189 in 1923-24, and the number of hands employed from 395,425 to 429,990. The value of plant and machinery increased from £78,085,680 in 1921-22 to £99,552,539 in 1923-24. Mr. Dalton says that Australian industries on the whole are advancing in the satisfaction of home demand. The output of Australian factories per head of the population is very much in excess of the imports per head. This is a feature of Australian trade which is often overlooked, the belief being widespread that the import trade is very much more serious than it actually is in competition with Australian industries. A more or less detailed list of the various classes of industry appears in the report, from which it is gathered that the number of factories producing metalwork, machinery, &c., in 1922-23 was 2,349, with a total output value of £51,038,984. In another section, "Heat, light and power," the number of works is given as 590 and the total value of output £13,467,604. Apart from industries in connection with the production of food and drink, by far the most important industries in Australia are those connected with the manufacture of goods from metals and textiles. There has been a rapid development in these in the last few years; as regards the former, particularly in iron and steel. It has been maintained by these industries that they have to face very severe competition from imported goods, and they have made persistent requests for increased protection, which is likely to be accorded them. Considerable added protection has already been given them, particularly by the tightening up of the regulations with regard to the percentage of British labour required to qualify for preference and by the application of the Industries Preservation Act. A number of branch factories of British firms have been established in Australia, and during the past year many representatives of other British firms have visited the country in order to ascertain what possibilities of success might attend the establishment of additional factories. In some outstanding cases, the establishment of such factories has not been successful—sometimes due to over-capitalisation, high production costs, uncertainty of labour conditions, and lack of demand. It will soon be necessary, even if it is not now necessary, for Australian industries in certain sections to find an export outlet for their goods.

Tariff Questions.

Most of the secondary industries of Australia have made persistent demands during the past year for increased tariff protection, and the Tariff Board which was made permanent by Act of Parliament during the last session, has been busy throughout the year hearing applications in connection with a large number of classes of imports. During the year there was a great deal of complaint by Australian manufacturers regarding the importation of British goods containing a large proportion of foreign material, and it was contended that the requirement of only 25 per cent. British labour or material, or both, to qualify for British preference, was much too small. The Minister of Customs therefore decided to alter the basis on which preference was given, and it was at first thought that the new regulation would make the requirement for preference 75 per cent. British labour, or material, or both, but after discussion this view was modified. There has been, and still is, a good deal of misconception as to the requirements of the new regulation, many importers in Australia and exporters in Great Britain appearing to believe that there is an all-round 75 per cent. requirement. This is not the case. If no process of manufacture has been carried out abroad which could be carried out in the United Kingdom there is no specification of the percentage of British labour or material required to qualify for preference. That is, supposing that in £100 value of goods shipped no labour was applied to the goods abroad which could have been applied in the United Kingdom, as much as £99 might represent foreign raw material if the remaining £1 represented British labour, and still the goods would be admitted for preference. On the other hand, if any process of manufacture were carried out abroad which was commercially practicable in the United Kingdom, then if the goods were of a class made in Australia, 75 per cent. United Kingdom labour or raw material, or both, would be required to qualify for preference; thus, if in £100 value of goods 6d. represented labour carried out abroad which could have been carried out in the United Kingdom, £75 at least would have to represent United Kingdom labour or material before the goods would be admitted to preference. In cases of goods of a class or kind not made in Australia, in which foreign processes have been applied which are commercially practicable in the United Kingdom, the old "25 per cent. United Kingdom labour or material, or both" requirement still obtains.

Electrical Machinery Imports.

The report states that the total imports of machines and machinery into Australia in the year 1923-24 were valued at £12,716,184, as compared with £10,963,874 in the preceding

* Stationery Office. 2s. net.

year. No separate total for electrical machinery is given, but the chief sections of the electrical trade are set out. It is shown that the two most important items were cables and wires of all kinds, amounting in value to £1,274,274, of which the United Kingdom supplied £1,240,088; and dynamo-electric machinery valued at £990,351, the United Kingdom's share being £613,153 and that of the United States £271,041. Complete lists of Australian electrical imports in the years 1922-23 and 1923-24 appeared in our issue of July 10th, 1925 (page 76).

Trading Methods.

Although the population of Australia is only about 6 millions, the Commonwealth is Great Britain's second largest export market—a fact that should be sufficient to attract the attention of firms in the United Kingdom and to lead them to look more closely into the possibility of development of this very valuable market. Close study of the market is necessary, for the difficulties of organisation facing any firm which sets out to extract the maximum amount of business from the Commonwealth can only be realised after first-hand investigation. The placing of agencies requires most careful consideration and appreciation of the differences between the various States. There are some well-known firms of agents which have their own branches throughout Australia, and with which agencies may safely be placed. These firms, however, are relatively few and are accordingly well supplied with agencies and are often unable to consider further offers. It is desirable, therefore, if not essential, to consider carefully the appointment of separate agents in each State. It is not sufficient merely to give an agency to a firm in Melbourne or Sydney for the whole of Australia merely because it asks for it, as the firm's organisation may be totally inadequate to cover the whole of the Commonwealth. Mr. Dalton says that many British firms of high repute have been seriously prejudiced in Australia by the appointment of agents who would never have been appointed had the exporting firms taken proper steps to understand the trading organisation of Australia, and to ascertain the standing and experience of the agent in question.

Magnetic Separation Plant.

By Col. B. I. ROLLING, D.S.O.

(*Abstract of Paper read before the* INSTITUTION OF CHEMICAL ENGINEERS.)

A GREAT variety of trades are interested in the possibilities of magnetic separation, but there is a paucity of literature on the subject. There are three uses for such separation :—

1. The concentration of weakly-magnetic ores—high intensity separation.
2. Slag reduction and the reclaiming of unburnt coal.
3. Removal of iron content from scrap material or from flowing material, *e.g.*, grain, sugar, for refining clay, chemicals, &c.

Of modern mining processes for grading out a mass of material into classes according to the relative susceptibilities to intense magnetisation, one of the most effective under certain conditions is magnetic separation. Many valuable minerals contain iron, sometimes in minute quantities, but generally in a sufficient amount and in a form which permits them (in a raw or roasted condition) to be influenced by a magnet.

Wetherill's separator was originally designed for the handling of raw ore containing valuable, or very weakly magnetic, minerals; later it was adapted for the removal of roasted pyrites from zinc blende, &c., as its capacity on such highly magnetic material is very large and costs for power and labour extremely low. The dry material to be treated flows on to the feed roller, which spreads it in a thin uniform layer over the whole width of the conveyor belt, as it travels towards the poles of two horse-shoe electromagnets, arranged one above the other. The poles of the upper magnet are forged in the form of a sharp wedge, while the lower ones are flattened. The principle is characterised as "sharp against flat," and it is the high magnetic concentration on the upper pole caused by the converging field which enables the separator to treat very weakly magnetic material. The magnetic force of the upper wedge-shaped pole supersedes that of the lower, so that the magnetic particles are strongly attracted towards the upper pole, but are intercepted and prevented from reaching the upper pole by a cross-belt which removes them quickly from the field and allows them to drop into a receptacle at one side.

The removal of the magnetic particles is assisted by mounting a sharp piece of iron on the front part of each upper pole; by means of this horn the influence of the magnetic field on the particles being removed is gradually decreased. These separators may be constructed with one, two, or three double magnets giving two, four, or six poles, each double magnet having a rheostat for regulating the current strength. A take-off belt is provided for each pole, and a single feed conveyor belt for the entire machine.

This form of separator is durable and accessible, and when once adjusted to the requirements of a particular ore, it will operate continuously at a nominal cost for the renewal of wearing parts. The use of a series of magnets of different strengths permits the separation from one another of materials having different magnetic permeability, as well as the separation of the magnetic from the non-magnetic. The separate removal of the strongest as well as the very weakest magnetic minerals is thus obtainable. All ferrous ores, whether oxides, sulphides, or arsenical, are susceptible to magnetic concentration.

In the concentration of ores, consistent sizing plays a very important part. Ding magnetic separators extract by means of a revolving disk directly above the conveyor belt which carries the ore through the magnetic zones of the separator. The capacity of a magnetic separator is in direct inverse ratio to the mesh to which the ore is crushed. Another factor which determines the capacity of the separator is the reluctance of the mineral to magnetic flux. Pure iron furnishes the least resistance to magnetic flux and each impurity adds to the resistance offered to the flux passing through it. To extract iron filings from brass chips, for instance, requires only a weak magnetic field, but wolframite requires a separator in which the magnetic lines of force are concentrated upon knife edges that produce zones of magnetic flux which virtually saturate the gap between the poles through which the ore must pass.

It was customary, before high-intensity machines had been exploited sufficiently, to subject zinc ores to a substantial "sweet" roast in order to oxidise them thoroughly, thereby making the iron sulphides perceptibly magnetic, and in so doing making it possible to extract them by means of a medium-intensity machine. Great waste resulted because with high-intensity machines only a very light "skin roast" is required, and therefore not only is the final zinc content of the finished product raised, but the roasting costs are cut and the high percentage of sulphur in the iron sulphide permits of its being utilised for the manufacture of sulphuric acid.

In the zinc fields of South-Western Wisconsin, concentrating plant, which previous to the application of high-intensity magnetic separators had tailing piles averaging from 2 to 5 per cent. zinc, the loss has been reduced to less than ½ to 1 per cent. and the content of the finished ore has been raised from 57 to 63 per cent. Iron sulphides have found a ready market at acid plants and bring from 21s. to 35s. per ton. Formerly the latter was not only a direct loss but also required fuel to burn off the sulphur, and incidentally also encouraged lawsuits arising from the destruction of crops and vegetation in surrounding districts.

For separating slags containing iron from coke and other fuel residues, the wet process is cumbersome and of small efficiency; the plant is expensive, the working cost high, and valuable quantities of fuel are lost.

The greater part of the fuel residues which are no longer combustible possess magnetic properties; the fuels contain iron compounds to a small extent (*e.g.*, pyrites) which are converted in the fire to various oxides of iron and appear in the ashes and slag as silicates by fusion with SiO_2, and it is possible, by passing the ashes through a highly-concentrated magnetic field, to recover the coal as a non-magnetic product.

This process can be carried out dry, whereby subsidiary plant, such as dehydrating apparatus, pumps and large settling tanks, are dispensed with, and only 1 kWh of d.c. energy is necessary to separate one ton of ashes. Even the finest material can be treated and the fuel contained therein easily recovered. Also it permits of the recovery of the coke and unburnt coal in an easy and cheap way from ash and slag wastes from industrial works, railways, shipping, and from refuse. Recovered fine particles of fuel can be made up into "briquettes" or directly fired as powdered fuel.

In view of the simplicity of the equipment, it is possible to build a profitable plant for a very small output, such as would not be possible in the case of a wet mechanical plant. The economic advantage of the magnetic process becomes much more apparent, however, when the greater yield of coke and unburnt coal is taken into consideration. When we realise the huge quantities of fuel residues produced annually in industry, traffic organisations and households, we perceive that the magnetic process is capable of bringing about great national economies. The most common application of magnetic separators is the separation of material of high magnetic susceptibility. Machines are liable to be damaged by the presence of iron or steel, in the form of nails, bolts and nuts, &c., which are also in many cases detrimental to the finished product. One of Messrs. Christy Brothers' machines, capable of extracting iron from materials such as cotton seed, destructor clinker, bones, &c., has a shaking tray which serves the double purpose of distributing the feed uniformly, and also causes the iron to sink to the bottom of the stream by gravity. It then rides over the slowly revolving magnetised cylinder, when the non-magnetic material falls down in front, and the iron is carried round past the bottom and falls at the back. The release is effected by two commutators, one at each

end, breaking the electric current which energises the magnet coils, just as each row passes the bottom; the commutators also connect each row as it passes the top, thus magnetising them again.

The stud feature is used by the Rapid Magnetting Machine Company. The belt is studded with conical "feelers" which become magnetic when passing over the drum, thereby increasing the magnetic field. "Igranic" magnetic separators are employed in a large number of sugar plants to remove iron rust or oxide from animal charcoal, a contamination produced while passing through the "char" burners, so that trouble with iron colouring in the sugar is prevented.

The use of powdered or pulverised fuel has led to the need of magnetic separators in cement works, steel works, power houses, and many other kinds of plant. A pulley made by the Igranic Electric Co. consists of a number of steel disks keyed to a shaft, an electromagnet winding being placed between alternate disks. The magnetising coils are wound on steel bobbins, which are dowelled to the disks to prevent shifting. The coils are all connected in series and terminal wires brought through a hole in the centre of the shaft to a pair of collector rings. The coils are impregnated with a moisture-repelling and insulating compound by the vacuum process, and the space surrounding them is filled with the same compound poured in the molten state during assembly. A tubular brass spacer, which also performs the function of a coil shield, is placed between the adjoining steel disks.

In designing such pulleys, it must be borne in mind that dimensions and weight are not the only features. Less copper and more steel secures a cheaper construction, while an abundance of copper may be spoiled by a lack of steel in the magnetic circuit. A small reduction, as from 100,000 to 90,000 lines per square inch, reduces the pull to 81 per cent. The windings, if placed near the shaft instead of near the outside of the pulley, will require much less copper, but the efficiency will be reduced on account of excessive leakages. Large diameter pulleys will, in every case, give better results than those of small diameter, and the wear and tear on the belt is less. Good practice allows 3 in. of diameter per ply; for example, 18 in. diameter for a 6-ply belt. Small diameter pulleys, however, have a lower first cost, and where a short belt is installed their use is permissible. Where conveyor flights are long, and especially where the magnetic pulley is a driving pulley for the conveying-belt system, it is frequently economical to use a large diameter narrow-face pulley because of the saving effected in the cost of a narrow belt.

For removing iron from metal turnings, dust, and similar materials containing a large percentage of iron, the feed tray is oscillated sidewise, and the delivery end is serrated to distribute a regular stream of material on to the whole width of the revolving brass drum, which has ridges at intervals across its width. Inside the drum are fixed electromagnets with alternate poles. The magnets radiate from the centre and occupy one half of the drum only, the other half being hollow, and the magnetic field extends round the front half of the drum. The iron is attracted to the surface of the drum and momentarily held there till one of the brass ridges pushes it out of the field of the magnet of, say, north polarity. The material then jumps to the next magnet, which will be a south pole, and this process is carried on till the last magnet has been passed, when the magnetic material falls. Whilst the iron is being pushed from one magnet to another it changes polarity and throws out any particles of brass which may be adhering, preventing waste and giving a clean product at the back. The process will successfully separate a mixture of 99 per cent. iron and 1 per cent. brass or copper, &c., turnings or filings.

A less expensive class of separator consists of a trough in the bottom of which are concealed electromagnets to attract the iron content. This type is limited in application and cannot be recommended for material containing more than 3 per cent. of iron.

Finally the liquid separator is used chiefly in art-tile and porcelain manufacture for the treatment of slip which passes up the annular space between the core and the non-magnetic tube. The magnetic substances are held against the grooved section of the pole pieces which serve to concentrate the flux across the air gap at these sections. The apparatus must be de-energised and flushed down for the removal of the magnetic material.

Considerable improvements have been made and patented in this country by Krupps, of Magdeburg, most being so designed that the material to be separated is acted on at several points simultaneously. Another device of Krupps relates to the wet magnetic separation of ores and other materials by the aid of drum separators of the kind in which the material is charged on to the upper part of a drum in contradistinction to those wet processes in which the magnetic separating surface is located above the feed conduit. At the same time there is formed on the separating surface a continuously renewed layer of water, the raw material being itself charged either dry or wet. The magnetic particles are attracted to the separating surface through the liquid layer, while the non-magnetic particles are held back by the surface tension, so that good separation is effected.

Krupps have also recently patented a system of multiple drums, by means of which the material withdrawn at one or more points of separation is fed on to the next point for repeated treatment. Another interesting separator by the same firm has pole plates so constructed that the individual fields formed by each two adjacent plates increase or decrease in the direction of the supply of the material. The plates can be adjusted axially for increasing or decreasing the field. The pole pieces can also be adjusted radially. An interesting type is made in this country by the Rapid Magnetting Co., and in America by Ding's Separator Co. It is used mostly for the treatment of refuse and the removal of tins, &c., and consists of a rotating screen and a curved magnet or magnets. The material is fed into the rotating screen, and the magnetic contents are held to the sides of the screen until they are just above a chute, at which point the magnetic circuit finishes, and the tins or other iron articles are dropped into the chute.

Discussion in London.

Mr. H. N. Ridge referred to a magnetic separator which was used in New Jersey 26 years ago for treating zinc ores, which were dealt with at the rate of 1,000 tons per day. He also illustrated machines which he used in Australia in the nineties, and with which he had been able to produce zinc concentrates commercially from Broken Hill sulphide ore. Later, however, the plant had been scrapped, because the magnetic separation of the weakly magnetic ores had been superseded by flotation, except in isolated cases. Referring to a statement in the paper, that sulphide and carbonate zinc ores were roasted in order to oxidise the foreign sulphides associated with zinc, he did not think any plant was carrying out that operation to-day. Plant in operation to-day might appear to be very similar; the operation in that case, however, was not roasting, but calcination.

Professor J. W. Hinchley referred to the separation of leucite mineral, of which 55 per cent. consisted of a black gangue which was slightly magnetic. The gangue was not readily removable by the standard Wetherill magnetic separator, but when the lower magnet of that machine was removed, the material was handled perfectly. With the magnetic system usually adopted in the Wetherill machine, separation was a failure. He had seen the machine actually dealing with 1½ tons of total material per kilowatt-hour without the lower magnet, the upper magnet doing all the work.

Mr. W. M. Mordey was not surprised to hear that the Wetherill machine had been able to deal with leucite quite well when the lower magnet was removed. The thing that impressed an electrical engineer when he began to study magnetic separation was that the inventors of machines knew very little about electricity, and less about magnetism; however, the inventors knew a very great deal, and obtained results which they would never have obtained if they had asked the advice of electrical people. In the Wetherill machine, both magnets attracted the material, and the action of the separator was a differential one. If the lower magnet were taken away it was possible that a better result would be obtained, because there would then be no differential action, but a flux would be set up which would enable the material to be lifted. Most of the ingenuity of inventors had been spent, not in attracting the material to be separated, but in getting it away from the magnets; the actual attraction was a comparatively small part of the problem. Hitherto only direct current had been used, but recently he had been experimenting with alternating current; by repelling material instead of attracting it, one got rid of the difficulty of having to remove the material from the poles, and a cleaner concentrate could be obtained. Mr. Mordey showed a number of slides to illustrate his work, and one of them showed how a magnet repelled specular hematite in the form of a halo a considerable distance from it, there being no signs of attraction or lines of force. The material was interesting; in books it was said to be non-magnetic, but it always occurred in nature, he believed, associated with a little magnetite, and if that magnetite were removed by an ordinary magnet a residue of specular hematite was left, which was not attracted by an ordinary magnet, or even by a strong electromagnet. The only means by which he had been able to demonstrate that the material was slightly magnetic was to scatter a little of the fine powder on water, when the material floated very slowly and formed two clouds over the poles of a magnet. Yet, in an a.c. field it was repelled in the form of a halo, the distance between the pole and the inner diameter of the halo being about eight inches. Another slide showed the effect of a two-pole alternating-current magnet, forming two halos of the repelled material coalescing, whilst in another case a mixture of magnetite powder and specular hematite scattered over the single pole of an ordinary laminated alternating-current magnet showed both attraction and repulsion. Attraction and repulsion of the same material by an a.c. magnet was also illustrated. A two-phase magnet was used, with successive poles overlapping one another, giving the effect of a moving magnetic field, the forces overcoming one another, according as the field was weak or strong.

Hungarian Company Regulations.—*Reuter* reports that, by a decree recently published, all joint-stock companies in Hungary have been directed to arrange their future balance sheets on a gold basis—in terms of the new currency unit, the pengo (27.8 to the pound sterling). It is also decreed that a revaluation of the assets is to take place and companies with net assets of less than 50,000 pengo (say, £1,800) are to be wound up, unless they are companies with purely local interests, in which case the minimum will be 10,000 pengo. The nominal value of the shares in these companies is not to be less than 10 pengo; shares of lower value are to be amalgamated. Branches of foreign firms, insurance companies, and co-operative societies are subject to special provisions.

New Electrical Devices, Fittings and Plant.

(Readers are invited to submit particulars of new or improved devices and apparatus.)

An Electric Lawn Mower.

Fig. 1 is an illustration of an electric lawn mower which is marketed by the COLDWELL LAWN MOWER COMPANY, Newburgh, N.Y., U.S.A. The cutting and propelling operations are controlled by the motor and the steering is effected

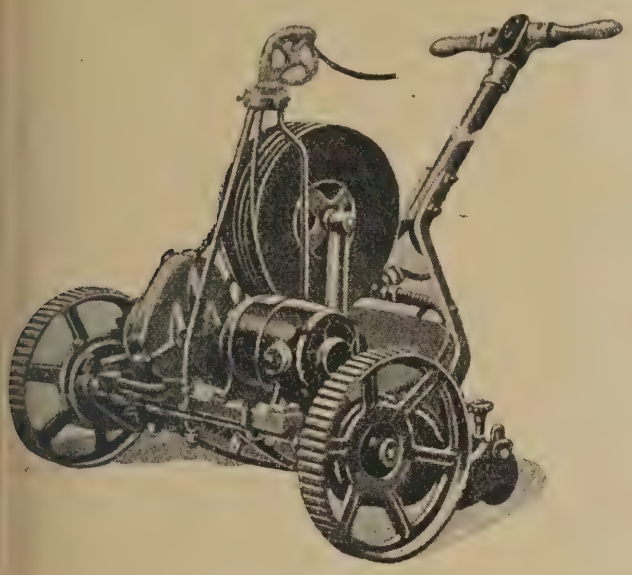

Fig. 1.—Electric Lawn-Mower.

by the operator. It is claimed to be practical, efficient and silent, and capable of dealing with a quarter of an acre in an hour. The machine is fitted with "Timken" tapered roller bearings, and the motor is designed specially for the purpose. An automatic reel takes up and pays out the supply cable.

A Street-lighting Unit.

The accompanying illustration, fig. 2, is one of the 400 G.E.C. "Paisley"-type street lamp posts equipped with lanterns and "Superlux" globes, which have been installed by the Paisley Corporation for the lighting of its secondary streets and roads. The post is provided with a hinged door at the base, inside which is accommodation for fuses, time switch, &c. The globe is 16 in. in diameter, and is suitably ventilated for a 300-W gasfilled lamp. At Paisley two 100-W lamps have been fitted in each lantern, and it is said that the resultant illumination is highly pleasing, free from glare, yet of sufficient intensity for side-street lighting. Two of these street-lighting units were shown at the recently-held electrical exhibition in Paisley. They are particularly suitable, it is claimed, for residential districts, as they combine efficiency with ornamental design. For this reason also they should prove particularly useful for such places as seaside gardens, &c., as they are practically all cast-iron. Credit for the layout of the Paisley lighting scheme is due to Mr. W. Blair Smith, the Corporation engineer.

Fig. 2.—Paisley Lighting Unit.

An Automatic Stuffing Box.

We illustrate in fig. 3 a new type of stuffing box which has recently been marketed by the PULSOMETER ENGINEERING CO., LTD., Nine Elms Iron Works, Reading, and which is designed to overcome the difficulties that arise in centrifugal and other forms of rotary pumps when dealing with water containing grit or dirt. The box space is fitted with a bronze bush which is a sliding fit on the spindle and a driving fit in the bore of the stuffing box. A cast iron housing is held in position by lengthened gland studs. In the housing are fitted two hardened-steel sleeves which are caused to rotate with the spindle by means of a key. These sleeves are kept apart and in contact with the neighbouring faces by means of a helical spring which, incidentally, has the effect, it is claimed, of churning up the grease and allowing it to find its way through the space between the ends of the brushes or sleeves; the grease enters through this space and works along the spindle, efficiently lubricating it and preventing the ingress of dirty water. When fitted on a pump with a suction lift, the higher this lift the more effective, it is claimed, is the action of the packing because the grease is drawn more forcibly through the fine clearance between the shaft and the bush, affording continuous automatic lubrication. This keeps the working parts perfectly cool at the highest speed and the frictional losses are practically

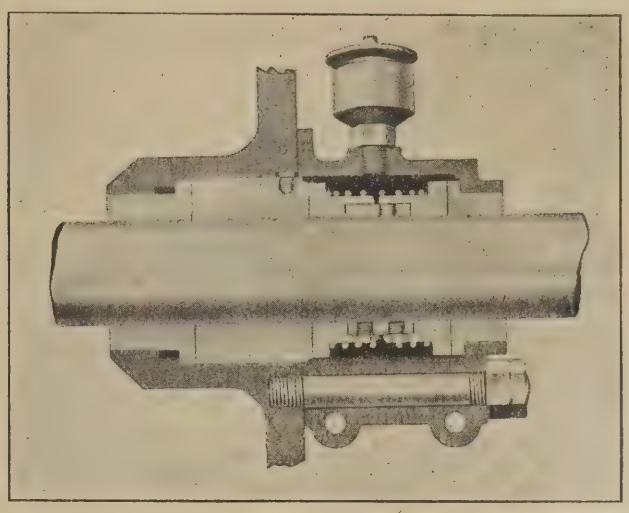

Fig. 3.—Automatic Stuffing Box.

eliminated. When the pump, instead of drawing its water, is fed from a positive head, it is essential that the grease in the housing should be fed into the gland at a pressure higher than that at which the dirty water enters the eye of the impeller so as to ensure the grease flowing in the right direction. Special lubricators are supplied for this purpose.

An Electric Hand Plane.

MESSRS. RENE VOLET, LTD., 242, Goswell Road, London, E.C.1, have put on the market the "R V" hand-planing machine, fig. 4. It is a wood plane in which the ordinary fixed steel plane is replaced by a rotary steel cutter. The latter is driven, through the medium of suitable pinions, by a 1.1 h.p. "R V" motor designed for use on both a.c. or d.c. The cutter is 4.75 in. wide and is capable, it is claimed, of rapidly rough-planing the hardest of woods with the minimum of effort, and

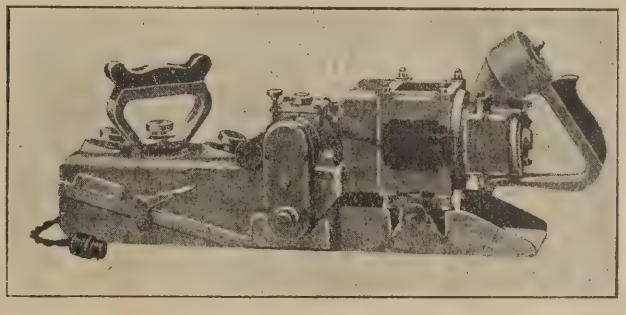

Fig. 4.—Electric Hand Plane.

when working on beech or oak, a cut of $\frac{1}{8}$ in. deep is readily obtained with a rapid forward movement. The rear part of the machine is always kept on an exact level with the rotary cutter, whereas the elevation of the forward part can be adjusted by means of a very simple mechanism controlled by an accurate vernier. The forward sale is used to limit the depth of the cut while the rear one ensures a thoroughly straight guidance and prevents the cutters from plunging or slipping. This construction is claimed to result in work of the highest accuracy.

A New Batten Holder.

We have received from MR. J. C. WHITE, 49, Bridge Street, Deansgate, Manchester, a sample of a new batten holder which he has recently placed on the market. It has been designed to meet the H.O. requirements and for use in basements, cellars, &c., where the head room has to be considered. The metal parts are embedded in a compound moulding which is claimed to be fireproof and shockproof. The connections are enclosed entirely in the base, which is covered by a back plate of the same material. A bonding ring renders it a convenient device for use on lead-covered cables.

Wireless Telephony.

Its Past, Present, and Future Possibilities.

(Résumé of popular lecture delivered before the INSTITUTION OF ELECTRICAL ENGINEERS *on January 7th.)*

CAPTAIN P. P. ECKERSLEY, chief engineer of the British Broadcasting Co., in a lecture on the above subject, said that his convinced opinion was that wireless telephony would play only a secondary part as a means of communication; its disadvantages would preclude its use to a very large extent for any but the great fundamental work of broadcasting. People in this country did not appreciate what a tremendous industry had already been built up. In the United States the sales of wireless apparatus last year totalled 500,000,000 dollars in value and doubtless we should have a similar annual turnover in this country.

As this was in the nature of a popular lecture, he began by explaining in general principles how broadcast telephony was achieved, and then explained how experience had shown that it was impossible to work two broadcast stations unless they were separated by 10 kilocycles in wave-length, and suggested that all the complaints about interference were really an indictment of methods of receiving and not of transmission. Following a brief explanation of detector efficiency he referred to such arrangements as the Armstrong super-regenerative receiver which, for ordinary receiving, thank God, he said, had not been generally adopted. As a third point in his popular explanation of general principles an indication was given of the Heaviside layer and the theories concerning it; of the proposals that had been made to get over the distortion which now existed, due to the Heaviside layer, one was that the transmission should be sent over a wide wave band and by means of three or four receivers it would be possible to combine the components at the receiving end and so cheat the Heaviside layer of its distortion properties. That suggestion had not been put into effect, but it would be extremely interesting as an ordinary straightforward experiment. Whilst a solution of the difficulty was being sought in terms of higher power and longer wave lengths (the scheme adopted at the Rugby station) others were endeavouring to secure the object in view by means of short waves, but it was certain that long-distance wireless telephony would never enter its wider field of development until a solution of this distortion difficulty had been found. Explaining a diagram of the usual method of controlling the output of high-frequency waves, in support of his statement, Capt. Eckersley said that in commercial sets it was necessary for the generator to be capable of sending out twice the power it was delivering to the oscillating system, and when they spoke of 1½-kW sets what was really meant was 3 kW, because whereas at one moment the power sent into the aerial would be double the normal, at other times it would be nothing. Modifications of the method of control were illustrated, notably that of the Western Electric Co., which added a high-frequency magnifier in order to achieve some economy, which possibly was achieved and possibly was not. Another method of control was introduced by Captain Round, of the Marconi Co., in 1919; it was not used a great deal at present and it had the disadvantage that it absorbed only one half cycle, and in doing so might produce a strong second harmonic. Still another was the grid-control system that functioned in some way which he had never yet heard thoroughly explained.

Captain Eckersley had intended to speak about duplex telephony, but time did not allow him to do so. Wireless telephony would be useful to link up land lines and small duplex installations would be useful adjuncts to landlines in places where it would not pay, or be possible to, lay a cable. Captain Round and Mr. Franklin had shown that it was perfectly feasible to work such a system. He had often wondered why such stations had not been used to a greater extent all over the world to link up scattered points.

Those responsible for broadcasting started full of hope and ideas, but with no money, and they had built up a system which had served as a model to the world; nearly every European nation had adopted a system "something like our own." Every listener, no matter where he might be, must be given a signal robust enough to operate his set because it must be realised that 10s. was worth as much in Aberdeen as in the metropolis. The B.B.C. started with eight stations, but it was found that about 50 per cent. of listeners were not served in the manner it was desired they should be. He had got into more trouble through talking about crystal areas, but the fundamental consideration was that if a signal could be received on a crystal set, it meant that local interruptions were negligible; thus the crystal had been taken as the popular criterion of signal strength and after the first experiences with the eight main stations, the B.B.C. set to work to make 100 per cent. of the country a crystal area. There were even now, however, two possible troubles: One was that broadcasting could never go on in a perfectly natural way until it was possible to satisfy the "grousers" by giving them two things to grouse about instead of one. Alternative programmes would not be a complete solution, because of the international situation which had now to be considered in relation to any national system. At the present time, a station in Rome might seriously interfere with transmission in London and, as a result, the multi-station idea would have to be abandoned in favour of fewer stations; because of the uses made of wireless outside broadcasting it was essential to get an international solution. If the 250 stations working, or in contemplation, in Western Europe were to work unhindered it would be necessary to make one station do the work of five or six, and that could only be done by using far higher power than was now the case. There were difficulties, however, because however much some countries might be willing to scrap their present stations and build new high-power ones, they were not rich countries and they might not feel it fair that they should be asked to do so. Therefore, the solution that had been put forward was that certain of the important stations should be granted exclusive wave-lengths to themselves and to arrange that certain of the others should work on non-exclusive wave-lengths. In this way, the limited number of wave-lengths would be made to go round. If two stations worked on exactly the same wave-length there would be no interference between them up to a distance of five miles; at a distance of 10 miles one would detect a faint background of mush, and at 15 miles there would be definite interference. Therefore, it was established that two stations in different parts of the country working on the same wave-length would only have local significance and only in their crystal areas would such local programmes be received. The difficulty of getting the fineness of adjustment between two such stations, which had to be of the order of one-hundredth of one per cent., must not be overlooked, but perhaps the new crystal, which could be ground to give that accuracy, would assist. The task confronting the B.B.C. as a transmitter was extraordinarily simple in essence, but amazingly difficult to achieve, because the aim was to transmit from a frequency of about 30 up to about 10,000 cycles with equal clearness at the receiving end; so far there was no method which could render sound a measurable quantity and, although there were the advocates of the pressure method of testing and the audibility method, he believed eventually they would arrive at something between the two; he wished someone would provide a means for measuring what was being done.

Finally, Capt. Eckersley discussed transformer design and indicated the attempts that have been made to secure a more or less straight curve. It had been said that the transformer was the worst possible piece of apparatus and that it behaved badly, but that was not so; if the transformer were designed properly, it could be almost as perfect as resistance-capacity magnification. One way of overcoming leakage was to make the load as small as possible, and a transformer for wireless work must be designed like a power transformer to get proper regulation the whole way; that should be borne in mind and be appreciated as a fundamental conception underlying the design of transformers. Showing a curve obtained with the type of transformer now being used for simultaneous broadcast work, Captain Eckersley said it showed that there was no difference between a properly designed transformer and the vaunted resistance-capacity coupling. This result, he said, had been obtained by a little trick which consisted of using a choke in the anode circuit and a condenser in series with the transformer primary. Regarding input transformers, by making the transformer equal to the mean impedance of the line, a compromise was obtained which had proved successful.

Discussion in London.

PROF. C. L. FORTESCUE, after complimenting Capt. Eckersley upon delivering the lecture in his own inimitable way, said that the engineers of the B.B.C. always had before them the goal of perfection, but they had never allowed the best to be the enemy of the good. Thus it was that a system had been built up which had been copied the world over. Although acoustics was not usually included in the ordinary term of engineering it was quite obvious now that it must be, and there were very few who would care to tackle Capt. Eckersley on the problems of acoustics. The general impression from the lecture was that the receiving end was the one upon which the greatest concentration was required at the moment, and from this point of view it was to be hoped that in the fairly near future it would be possible to obtain receiving sets which would be cheap, selective, and efficient. There were very few people in this country who could afford £100 for a beautiful imitation of a piece of old furniture, most of the interior being occupied by a raucous loud speaker, and therefore the great need was a set which had the advantages of good selectivity together with cheapness in first cost and in maintenance.

Mr. P. J. VOIGT said it must be admitted that the loud speaker was the weakest link in the chain, and the point to be determined was what a loud speaker was expected to do. Was it to give the effect of a man speaking in the room, or the effect of the sound coming, as it were, through a hole in the wall? He had experimented on the latter lines, but in working out his calculations of pressure, velocity, &c., he had made the mistake of assuming that the hole was infinitely big and that a comparatively small hole would give the same effect as a large one. Working on these lines he had built a loud speaker which unfortunately was not loud, but which reproduced tones that no other loud speaker had ever

done; the "s's," however, came through badly. He had then worked out another arrangement with the idea of faithfully reproducing the energy sent out from the microphone at the B.B.C. and, although he got a quality slightly better, he believed, than that actually sent out from the B.B.C., the idea at present was only an ideal. He argued along the lines of pressure rather than audibility and recently had developed a microphone which was practically an electric pressure gauge; with it he had obtained loud-speaker results which were the most natural he had ever heard.

Mr. C. M. R. BARLBI said it was well-known that stations did not trouble to transmit sounds of low frequency because the lower notes were not picked up by the receiving stations. That might be satisfactory for commercial work, but for ordinary broadcasting when so much music was transmitted, the lower notes could not be overlooked. Whilst this attitude might have been justified a year or two ago, the degree of perfection now obtained with receiving sets had changed the situation considerably and it seemed reasonable to demand that the B.B.C. should investigate this matter and obtain the views of listeners with regard to it.

Mr. E. H. SHAUGHNESSY (G.P.O.), referring to the statement that the turnover in sales of wireless apparatus in America now amounted to 500,000,000 dollars, asked whether the reason why they had not reached a similar figure in this country was Capt. Eckersley's "crystal" attitude, which had made it possible for everybody to make his own crystal set for half-a-crown. In connection with the congestion of wave-lengths and the suggestion that some system should be adopted of sending only on one half of the wave band, that was the method which was to be adopted at Rugby for the trans-Atlantic telephony experiments, and it was a method which had been explained to the Institution by Dr. Nichol, of the American Telegraph and Telephone Co. two years ago. He disagreed with Capt. Eckersley's statement that wireless telephony would only be useful for broadcast work; personally, he regarded wireless telephony as having a very wide field of application. It might well be that in the future wireless telephony would have to be relied upon to bridge long distances over water where cables could not be laid and there might even be an international agreement to prohibit wireless telegraphy and only allow wireless telephony, and so occupy the ether to a higher degree of efficiency. It must not be overlooked that wireless telegraphy was not cheap for long distances, because it cost a lot of money to run a big station. Whilst there were difficulties in having two or three stations working on the same wave-length, he should have imagined that it was an easily soluble problem, because there could be a land line connecting several stations with a master oscillator at one station to transmit the carrier wave for all the stations working on the same wave-length. He disagreed strongly with the implied suggestion of Capt. Eckersley that all reception and all loud speakers were bad, because if one paid a proper price it was possible to get a receiving set which would give almost perfect reception under present conditions.

Mr. D. KINGSBURY, speaking on quality of reproduction, said he thought the arrangement shown by one of Capt. Eckersley's slides by which a choke was used in the anode circuit and a condenser in series with the transformer primary was the answer to the "feathering" which was noticeable in the reproduction of certain notes in the bass region. This effect was particularly noticeable in connection with the drums and it was also noticeable in a certain announcer's vowel sounds. The horn as a means of amplifying the efforts of a small diaphragm would not be with them always; loud speakers would take the form of some large surface acting as an air motor.

Mr. S. BRAENDLE said he was using a form of cone loud speaker with which he was able to obtain the lowest notes in music, such as the double bass, or the drum, with equal clarity to the higher notes of the violin. There had been, however, one or two cases of unsteadiness which might be due to outside interference, or might be the same effect which Mr. Kingsbury had referred to as "feathering." He, however, was not inclined to blame the B.B.C., because he was using rectified a.c. and therefore was perhaps liable to some criticism.

CAPT. ECKERSLEY, replying to the discussion, said he had not wished to give the impression that transmission was so much superior to reception, because he was quite ready to admit that the problems of transmission were fewer than those of reception. It was, indeed, a little discouraging sometimes to feel that all one's best efforts to produce the best transmission were sometimes hideously ruined in the homes of the listeners, through no fault of their own, however. The point he always had in mind was that it would be a wrong policy to develop broadcasting on the lines of making it difficult to receive and it was for that reason that he had taken his "crystal" attitude, because if the owners of crystal sets could receive the signals then it was quite certain that the users of other sets would be well served, because the average crystal set was not selective. As to the suggestion that the B.B.C. was going to alter its wave-length, that statement was characterised by its inaccuracy. There was no intention of changing to 100, 110, or even 200 metres. Perhaps the difficulties of the B.B.C. might be better appreciated if Mr. Shaughnessy realised what his own position would be if the Post Office had no control over the receiving instruments in the homes of telephone users. The B.B.C. was compelled to proceed on the lines of compromise. He was surprised to hear Mr. Barlbi say that it was well-known that the B.B.C. did not transmit the lower notes, because that was not the case. Although, theoretically, there should be no interference if transmission took place on a half wave, there were practical difficulties in the way, and the receiver would not be selective enough. The land line idea for transmitting the carrier wave, as suggested by Mr. Shaughnessy, had been considered, but the trouble was international. In reply to Mr. Kingsbury, he did not think the circuit he had mentioned was responsible for the feathering effect referred to, and with regard to microphones he admitted that experiments were being carried out which might introduce some such effect. At the same time, unless the B.B.C. did experiment in this way upon the public, very little progress would be made.

Selling Electric Refrigerators.

A RECENT article in the *Electrical World* by a refrigerator manufacturer draws attention to a matter which, while at present little thought of in this country, appears to offer opportunities. The writer deals particularly with domestic refrigeration, and his remarks are reproduced below:—

It does not seem at all necessary that any drastic changes should be made in the present high-class refrigerator construction in order to render it adaptable to electric refrigeration, and the advisability of establishing a standard refrigerator—that is, with respect to size and form—is seriously questioned. Manufacturers would be more than pleased if only one style were in demand, but, despite the fact that every effort is made to keep the line as simple as possible, they are obliged, because of the various tastes of the public and the definite but non-uniform space allowed for refrigerators in homes, to produce about fifty different sizes and styles of refrigerators. Any one of these is adaptable to electrical refrigeration without material change. The prime necessity is that scientifically constructed refrigerators should be used at all times, either with ice or electrical refrigeration, and that this should be particularly insisted upon by mechanical-refrigeration manufacturers and the dealers through whom their products are distributed. A study of this problem would reveal that the idea of good refrigeration must be imparted to the public first and that of electric operation next. The first task should be backed not only by refrigerator manufacturers, electric refrigeration-unit manufacturers and electric utilites, but by ice companies as well. The latter have been worrying about the inroads upon their business by electric refrigeration, but if they can be shown that this plan will help their business by stimulating the use of more refrigerators in more homes, they will give increasing help to the electric refrigeration idea, in which utilities, the electric refrigeration-unit manufacturers and refrigerator manufacturers are particularly interested. The policy endorsed at the recent convention of the National Association of Ice Industries at Los Angeles to launch an intensive campaign to educate the public to use more household refrigeration is in the right direction. Co-operation of the ice manufacturers with the N.E.L.A. on a plan which, it is believed, is now being worked out, will be beneficial to everybody concerned. The electric refrigerator is acknowledged to be the greatest revenue producer for central-station companies that has been placed on the market for some time. Granting this, an almost unlimited amount of assistance can be rendered by these companies in placing the refrigerator before the public. This can be done by wide-spread publicity. Some electrical companies have started a scheme of advertising, applying the amount of money it costs to connect a new residence with the street lines to a fund for newspaper announcements covering every electric refrigerator that goes into a home already wired. This is a good start, but I believe they can afford to go much further and spend considerable money, not only in local advertising, but collectively in national publications in order to further this new application.

Electrically-operated Crossing Gates.—A description is given in the *Railway Gazette* of an example of electrical operation for railway-crossing gates which may be seen at Sleaford, Lincolnshire, where the L.N.E.R. crosses the Southgate Road. The crossing is protected by four 25-ft. gates connected to a common driving rod cranked up to the signal box and operated by a crab working a crosshead travelling along a double-threaded screw shaft. The operating mechanism and levers controlling the running signals are so interlocked that before the gates can be moved all the signal levers must be in the normal position. This protection is ensured by electrical detectors fixed to the respective gateheads. A 1½-h.p. series motor is geared to the controlling shaft, its speed and direction being controlled by the necessary equipment operated by the signalman. A friction clutch on the motor shaft prevents any damage to the gates by a continued pull when they reach their open or closed positions. The electrical equipment was supplied by Messrs. Thos. Broadbent & Sons to the L.N.E. Railway's specification, and was installed by the railway company's telegraph and signalling staff.

Correspondence.

Correspondents should forward their communications **at the earliest possible moment.** *No letter can be published unless we have the writer's name and address in our possession.*

Super-Station Switchgear.

I was rather surprised to read the opinions expressed by Mr. G. L. E. Metz with reference to the above subject in your issue of January 1st.

I cannot agree with his statement that a comparison of the oil-circuit-breaker designs of the five main manufacturers in this country will reveal such a close similarity for a given rating.

This is borne out by a recent comparison of oil circuit breakers having approximately the same rated rupturing capacity, manufactured by five of our leading firms, presumably those referred to by Mr. Metz. In these designs the quantity of oil per phase varied from 9 gallons to 590 gallons, velocity of rupture from 4 to 9 ft. per second, head of oil from 8.5 inches to 26 inches, and length of break from 9 inches to 25 inches.

In addition, the tanks showed great variation in design, including rectangular, elliptical, and round tanks, the thickness of the walls varying from 0.375 inch to 1.25 inches.

Again, one manufacturer will pin his faith to Bakelite condenser-type bushings for the leading-in insulators, another to oil-filled porcelain insulators, whilst yet another considers compound-filled porcelain insulators to be the best. Each manufacturer gives apparently sound reasons for the choice of any particular design, but unfortunately it often happens that their opinions as to the principles underlying the operation of circuit breakers are very conflicting.

With regard to the external appearance of the containing structure of switchgear of similar type, I agree that there is a certain amount of uniformity in the various makes, but that is usually as far as the similarity obtains.

I am entirely in agreement with the writer of the article criticised by Mr. Metz, as regards the lack of unanimity of opinion on oil-circuit-breaker design. It is indeed probable that all the various makes would stand up to their *rated* duty more or less satisfactorily, but it is improbable that they would all have the same *actual* rupturing capacity.

C. A. Wilson.

Leeds, *January 4th*, 1926.

The Metering of Three-phase Power.

I regret that I have been unable to reply to "A Meter Superintendent's letter before, as, having been away from home during the holidays, I was unable to obtain my copy of your valuable journal.

I am in complete agreement with your correspondent regarding the fact that a two-element, 3-phase, 4-wire meter will give accurate results *provided* that certain conditions (which he mentions) are complied with. May I add that the condition $e1 + e2 + e3 = 0$ depends on the following:—

(1) That the voltages must be exactly equal.
(2) That they must be 120 deg. apart.
(3) That they are pure sine curves.

It is my contention that these conditions can be, and are, upset on a modern 3-phase supply system, and I therefore once more aver that the correct three-element system of metering should be employed. To say that one may know the circuit conditions is hardly sufficient since, as Mr. Malcolm has shown us in his recent article, these circuit conditions are likely to alter.

Since your correspondent has in his previous letter mentioned B.E.S.A. specifications, may I in conclusion add that the two-element, 3-phase, 4-wire meter does *not* comply with the B.E.S.A. meter specification No. 37—1919. (See paragraph 57.)

In reply to the last paragraph of your correspondent's letter, I regret that I am unable to publish the facts and figures which he asks for. To do so would mean my quoting *individual* practice and I feel sure your correspondent will appreciate my position and my inability to mention such matters here.

"A Meter Engineer" is to be congratulated on his excellent contribution. He, without doubt, deals admirably with many of the important points on this subject.

H. Hugh Jaques.

London, *January 4th*, 1926.

Electric Wiring.

I read with interest "Polyphase's" letter in your issue of October 16th. I note his remarks with regard to plumbers doing electrical work; I am aware of that practice, as I served my apprenticeship as an electrician in Scotland, but conditions are totally different "out here." Take, for instance, a wireman or electrician arriving at Wellington and seeking employment with a contractor; this employer dare not employ him until he applies to the City Council for a licence, as the examinations are held every six months. If he can satisfy the local electrical engineer as to his experience and apprenticeship, he will be granted a "Provisional Licence" until the examination; then he will have to go through a theoretical and practical examination. At every new town he goes to throughout New Zealand he will have to obtain a "ticket"; in fact, there is a township approximately eight miles from Wellington called Lower Hutt, and neither of the supply authorities recognises the other's ticket. There is some word of a "National ticket" coming into force next year—the sooner the better. Now take the employer's side; should he be a master plumber and desire to commence wiring, he will be barred throughout New Zealand from doing anything. He has only one resource and that is to employ an electrician holding a master's certificate (note, not a wireman's ticket as explained above; the "master's" is much harder to obtain). So you will see what the plumbers in this country have to contend with; well, why shouldn't they?—"one man one job."

When the contractor obtains any wiring job, from one point upwards, he dare not commence it until he gets a "permit from his Power Board to commence work; the same thing applies to alterations and extensions of old installations. I should like to see some of the "knights of the gas pipe" in the old country under our regulations out here. I admit that at first I did not care too much for the N.Z. regulations, but after residing in New Zealand for two years one gets used to these things, and now I congratulate the Government and fire-underwriters of N.Z., as your readers will see that no one but an experienced licensed wireman or electrician dare do any installation or electrical repair work. I may add that the sooner the supply authorities in Britain adopt some method like that of the Dominion of New Zealand the better it will be for them and electrical contractors, as well as for all competent persons employed in the electrical industry. I think the electrical contractors in Scotland and England would not miss the plumbers if they were barred from doing electrical work. I have often attended E.T.U. meetings in Scotland over the plumber question. I would be glad to hear from "Polyphase" or any other of the REVIEW readers. I have read the REVIEW for years now—I look forward to getting it out here. I may add I hold the master's certificate for electrical work. Wishing the REVIEW the best of success.

S. J. M. Ewart.

Hastings, N.Z., *December 7th*, 1925.

An Electric Vehicle Association.

Having informally discussed the present stage in the progress of electric propulsion by electric storage methods, I feel that now is the opportune moment for seriously considering the immediate formation of an Association, Institution, or Society consisting of those who are interested in any way whatsoever in electrical vehicles (*e.g.*, road vehicles, tractors, trucks, locomotives, launches, barges, &c.), whether they be manufacturers, electricity supply engineers, owners, or users thereof.

By such representation at periodical meetings where the progress in other countries would be reviewed, and papers read evoking free discussion, not only would the members benefit by exchanging opinions and so forth, but the interest of the general public would be aroused by the lay Press reports of the proceedings of an institution devoted solely to the subject of electrical transport for both passenger and goods traffic.

I am already assured of some support from those who fully appreciate the advantages which will accrue from the inauguration of such a society, but I would like to hear the views of your readers if they will kindly communicate with me direct, as I am arranging for an informal meeting at an early date to discuss formation details.

J. C. Elvy.

3-7, Southampton Street, London, W.C.2.
January 7th, 1926.

Meetings of the Institution of Electrical Engineers.

Those who heard Captain P. P. Eckersley's brilliant lecture on Thursday last were entertained in a manner seldom known at a meeting of the I.E.E. I wish, however, to enter a protest against an ordinary meeting of the Institution being devoted to a popular lecture, especially in view of the fact that the amount of time allotted to the discussion of the excellent papers by Captain P. Dunsheath and Professor S. Parker Smith was most inadequate in each case.

With the greatest respect, I suggest that the Council of the I.E.E. appears to be in danger of being carried away by the "Radio Flood" which is sweeping through this country at the present time; and I trust in future the ordinary meetings of the Institution will be restricted to the reading and discussion of engineering papers and to scientific lectures.

H. C. Silver.

Ewell, Surrey, *January 8th*, 1926.

Agricultural Electricity in Germany.—A special "Electricity in Agriculture" section is being organised in connection with the "Green Week" Exhibition to be held in Berlin from February 20th to 28th next. The section is being organised by the Union of Electricity Supply Companies in conjunction with the German Agricultural Society, and it is intended that the exhibits shall be of a comprehensive character to demonstrate the various directions in which electricity and electrical appliances can be advantageously used in connection with agricultural operations.

Reviews.

British Wire-Drawing and Wire-Working Machinery. By H. DUNELL, A.C.G.I., A.M.I.Mech.E. Pp. xv + 188; figs. 181. London: Constable & Co., Ltd. Price 21s. net.

This book forms one of the well-known "Engineer" series of volumes dealing with what may be termed the more or less specialised branches of the engineering industry. The wire-drawing industry and that of the design and manufacture of wire-working machinery are perhaps more specialised than most, and the author in his preface confesses that he often found a difficulty in obtaining information from manufacturers regarding certain phases of his work. Despite this, however, he has succeeded in getting together a fairly comprehensive account of the various ramifications of the trade, which after appearing as a series of articles in our contemporary *The Engineer*, is now issued in book form in the hope that it may help towards a greater interchange of knowledge among the individuals directly and indirectly concerned in the wire industry to the ultimate betterment of the trade.

The importance of the wire industry can be gauged from the fact that in this country alone, it consumes roughly three-quarters of a million tons of steel annually—very little iron wire is now made—and about half as much of the non-ferrous metals, including, of course, copper which is used in the manufacture of electric cables and transmission lines, although whether copper conductor of large size, such as is used for overhead tramway trolley wire or in armature construction, is included in this total does not appear from a study of this book. It is of interest to note further that apart from its intrinsic value, the wire industry is regarded in the United States and on the Continent as a vehicle for the consumption of large quantities of steel and is associated with and fostered by the steel industry in consequence. The manufacture of wire and of machinery for making wire goods, although they are highly specialised industries, are of particular interest to electrical engineers, first because of the fact that copper wire enters so largely into every branch of the electrical industry, and, secondly, because the complex and often very heavy machinery used in the wire industry is largely driven by electric motors and the driving of this machinery is often a problem demanding intimate knowledge of the conditions involved. Thus, in the course of a description of a works in which the wire rods are made, this forming the first stage in the manufacture of wire, it is stated that an electric motor of 2,750 h.p. is employed. This gives some idea of the extent to which power is utilised in the wire-making industry.

The ground covered by the author can be roughly divided into two parts, the first dealing with the manufacture of the wire itself and the second with the manufacture of various articles from wire. The production of the wire involves the manufacture of wire rods, of the various kinds of dies and wire-drawing blocks, and of the machines for the drawing of the wire, as well as straightening and cutting off in required lengths. The various processes involved are described in detail and a large number of illustrations and drawings of both the machinery and its essential parts are given. In fact, it may be mentioned that the illustration of the text is a notable feature of the book and one on which both the author and the publishers are to be congratulated. With reference to the second part of the book in which the conversion of wire into manufactured articles such as springs, chains, &c., is described, readers of the ELECTRICAL REVIEW will be particularly interested in the chapter dealing with electric cable making. It is indicative of the highly specialised nature of the wire industry that in this branch, as in many others, the manufacturers of the articles are also the designers and makers of the machinery which is used in the manufacture of the articles. An interesting process of which a description is given in this part of the book, is the flattening of wires from round to square or rectangular section, this being found cheaper than drawing the wire to the required section. The machines which have been developed for this kind of work are described and illustrated and it is apparent that their use leads to cheaper manufacture for certain classe of products. This is a process which is capable of being increasingly employed in the electrical industry.

Although, as his title suggests, the author deals particularly with British-made machinery, he occasionally refers to what is being done in other manufacturing countries, from which it is apparent that the wire industry is one which is considered all over the world to be of such great importance as to be worthy of careful study. We recommend this book to all who are interested in the industry in this country, particularly to those who realise that by the use of improved machinery it is capable of being still further developed.

The Elements of Internal-combustion Engineering. By TELFORD PETRIE, M.Sc., Assoc.M.Inst.C.E. Pp. xi + 236, with 62 diagrams. London: Longmans, Green & Co. Price, 10s. 6d. net.

The internal combustion engine has already become a prime mover of considerable importance to the electrical engineer. For the development of small amounts of electrical energy in isolated districts where current from a central supply is not available, no unit is more efficient than an oil engine directly coupled to a dynamo, and where larger powers are required, as in the electric generating stations of country towns, the Diesel engine-driven generator having an output of anything up to 1,000 kW is becoming recognised as the most economical form of unit available. The use of the Diesel engine as a stand-by and for dealing with the peak load of a hydro-electric installation is also of considerable commercial importance. For larger outputs, this type of engine cannot compete with the steam turbine when considered from the broad standpoint of commercial operation, but under special circumstances it is not unlikely that the internal combustion engine with its superior thermal efficiency might prove of considerable value. Thus, in dealing with the problems of coal conservation in this country, it is often urged that instead of burning raw coal it should be first of all subjected to distillation at low temperature in order to obtain the valuable by-products in the form of oil and ammonia. In this process of distillation certain quantities of gas are obtained and it is almost essential to the financial success of the scheme that some use should be found for this gas. It has been suggested that it could be employed to operate large gas engines which, in turn, would drive large electricity generators, the latter delivering their energy to a ring main connecting the various collieries where the distillation process is utilised. Other possible developments of the use of the internal combustion engine for the generation of electrical energy could be given, but sufficient has been said to indicate not only the present importance but the possibly even greater importance of this type of engine in the future to the electrical engineer.

In the book which lies before us, Mr. Telford Petrie has dealt with the theoretical aspect of the various types of internal combustion engine which are available at the present time and he has even ventured to suggest certain developments which may occur in the near future. The whole work is admittedly dealt with from the point of view of the student, but it does not necessarily suffer on that account, since one need not be young or go to a technical college to realise the importance of studying the development of any new phase of engineering science. After an introductory chapter in which the history of the internal combustion engine is briefly reviewed, the author gives a description of the various forms of gas engines and their cycles of operation, this being followed by a similar treatment of the various kinds of oil engines, *viz.*, petrol and paraffin engines and the heavy-oil engines, or the Diesel and semi-Diesel engines as they are often termed. In both of these chapters the most recent types are mentioned, including double acting engines, the Still engine and the Humphrey gas pump, simple outline diagrams being given of each type with, in many cases, indicator diagrams corresponding to the different strokes of the piston. The more theoretical aspect of the various cycles of operation is then studied in detail, such problems as the ideal efficiency, efficiency ratio, mean effective pressure and consumption of the ideal cycles being considered. This part of the work is prefaced with a brief outline of the theories of thermodynamics and the physical properties of a perfect gas. Considering next these theories in their relationship to the actual performance of an internal combustion engine, the question of the variation of the specific heats of a gas is dealt with and this is followed by the familiar treatment of the subject of entropy in so far as it deals with the problem of the energy developed during the cycle of operations in the cylinder of a gas or oil engine. The problems of ignition and combustion are next discussed, and finally the author gives a valuable chapter on temperature effects in which the important problems of jacketing, temperature stress and loss of strength of metals due to high temperatures are investigated. The volume concludes with a brief discussion on the possibilities of development in which the question of other cycles of operation and the internal combustion turbine are investigated. There are also a number of examination questions with answers grouped at the end of the book under the headings of their respective chapters and a comprehensive index is appended.

The whole work has been carefully produced, the diagrams are most informative—although some of them might perhaps have been reproduced to a rather larger scale—and no attempt has been made to unduly compress the various mathematical investigations, so that the working is always easy to follow. This is a book which should be in the hands of not only the student at the technical college, but of every electrical engineer who is desirous of understanding the theories underlying the design and operation of the very many different types of gas and oil engine which are being used for driving electrical generators.

Alternating Current Problems. By R. E. BROWN, Assistant Professor of Electrical Engineering, Moore School of Electrical Engineering, University of Pennsylvania. Pp. viii +84; figs. 16. London: Chapman & Hall, Ltd. Price 6s. net.

This little volume comprises a collection of examples, for the most part of a numerical character, arranged to illustrate the fundamental principles encountered in studies of the flow of alternating currents and of alternating-current machines. In the early part of the book special attention is devoted to the trigonometrical and symbolical methods of representing alternating quantities and many excellent and varied examples are included which will ensure a good and flexible knowledge of this important branch of electrical work to those who systematically work through them. The later part of the book,

which is mainly concerned with examples on generators, motors and transformers, is perhaps hardly so interesting as the earlier part, since the majority of the examples are of a more orthodox nature, nevertheless a wide range of work is covered.

The chief criticism we have to make is that, with isolated exceptions, no answers are given to the numerical examples. Students taking advanced work of this nature are not likely to delude themselves or others by making improper use of the answers, and, on the other hand, the answers would oftentimes be of very real help to those who have no opportunity of turning to an instructor for aid. It should perhaps also be mentioned that a small proportion of the examples will not be of great interest to English readers since they depend on an acquaintance with the Standardisation Rules of the American Institute of Electrical Engineers and are concerned largely with facts rather than with principles.

Teachers of electrical engineering are well advised to allow their students to work as great a variety of numerical exercises as circumstances permit and few teachers will fail to find new ideas relating to problems if they peruse a copy of the book under notice.

On the Road. By W. H. BEABLE. Pp. 115. London: Simpkin, Marshall, Hamilton, Kent & Co., Ltd. Price 5s. net.

Most of us have met commercial travellers of one kind or another. They have appeared in fiction and, occasionally, in caricature. They are to be seen in the train, and, less often perhaps, at the club. Many of us meet them in the course of business, and draw our impressions from that. But few people could give a very clear idea of them as a whole and of their work as a profession. The different types of men grouped together under the heading of commercial travellers seem to have so little in common, that only a rough conclusion would appear possible.

But the author of this book draws some very definite conclusions. He is not afraid to insist on the plain virtues of hard work and sobriety, truth and honesty. He asks the reader to do no more than he himself has done, and the following passage will give an insight into the style of the book and the character of the man.

"I had an appointment with a gentleman to discuss the question of selling Hungarian wines in this country, a subject on which I knew nothing whatever. I looked up Hungary in my encyclopædia, read all about the hills and dales where the grapes were grown, and the methods employed in the cultivation and production of wine. Then I turned up "wine" and became familiar with their peculiar properties, how they compared with French and other wines. Thus armed for the interview, I was able to discuss the subject so intelligently that my interviewer was quite astonished to learn that I had never been to Hungary, and had never been associated with the wine trade."

That is the way he talks from page to page through the book, for his style is simply good talk transferred to paper. His instances are best when drawn from his own experience. One or two of his quotations are less apt. For example, an employer asking a brisk young manager what the noise was outside would scarcely expect to get such a wordy reply as one story says he got

The book is, however, so readable that there is no need to magnify a solitary fault or two. One prefers to draw notice to its fluent and lucid English—a rare quality in books on commercial subjects. Some of the subjects dealt with are "The Salesman's Contract," "Selling Advertising Space" and "The Sales Manager." A bold commercial, genuinely dissatisfied, might lend it to his employer, in the hope that he might read about "Choosing an Employer." This chapter is something new in commercial literature.

The book is good value for 5s., but one hopes it may soon be possible to issue a popular edition so that juniors may share its good things along with those who are already on the road.

Trade-Mark Applications.

THE following are among the recent applications for British trade marks. Objections against any of the proposed marks may be entered within one month from January 6th :—

Day-Fan (lettering and design). No. 459,153. Class 6. Electric fans, electric motors, and parts thereof.—Dayton Fan & Motor Co., Dayton, O., U.S.A. (British representatives: White, Langner, Stevens and Parry, Jessel Chambers, 88-90, Chancery Lane, W.C.2.)

Combine (lettering and design). No. 462,791. Class 8. Variable electrical condensers and parts thereof.—Somco, Ltd., 1-11, Larch Road, Balham, S.W.12.

Salient (lettering and design). No. 462,958. Class 8. Scientific instruments and instruments and apparatus for use in radio-telephony.—S. A. Cutters, Ltd., 18, Berners Street, W.1.

K. (lettering and design). No. 463,682. Class 8. Electrical measuring instruments.—Beckett & Parker, 157 159, Summer Lane, Birmingham.

Lissenola. No. 464,071. All goods in Class 8.—Lissen, Ltd., Richmond, Surrey.

Brinford. No. 464,825. Class 8. Philosophical and scientific instruments and apparatus for useful purposes.—A. G. Brini, 63, Chelmsford Road, Woodford, E.18.

Elmah. No. 462,460. Class 11. Electric massage apparatus.—Hoare and Co. (Engineers), Ltd., 70, Old Broad Street, E.C.2.

Staba-Lare (lettering and design). No. 464,440. Class 13. Electrodes of ordinary metal.—Allen-Liversedge, Ltd.

Published Specifications.

Compiled expressly for this journal by Patent Agents.
The name of the applicant's patent agent, if any, will be found on the printe specification.
The numbers in parentheses are those under which the specifications will b printed and abridged, and all subsequent proceedings will be taken.

Electricity Supply: The Government Scheme.

ON Friday last week the Prime Minister delivered the long-promised statement with regard to the policy adopted by the Cabinet for the development of electricity supply in this country; and on Monday the Electricity Commissioners imparted further information on the subject to representatives of the technical Press. We now, therefore, are in possession of the main outlines of the scheme, which will be further elaborated in the Bill which is to be introduced into Parliament early in the new Session.

We are very glad to find that on many points we are in full agreement with Mr. Baldwin. To the facts which he quoted we take no exception, and the personal opinions which he expressed, as distinct from the proposals which, we take it, were formulated by his advisers, are in accordance with those which we have repeatedly put forward in these columns. For instance, he recognises that electrical power in itself does not afford the solution of industrial efficiency; he rightly stated that exaggerated statements had been made, and that cheap power alone could not revive industry. We also welcome his realisation that a good selling organisation is essential to the success of the electricity supply industry; that, in our opinion, is a fundamental requirement—but unfortunately the scheme makes no proposals for providing it. Again, Mr. Baldwin admits that the necessity for the standardisation of frequency is not universally accepted; an isolated area has little to gain from it. And lastly, he stated that improvement of the load factor was of vital importance—a view which cannot be too strongly emphasised.

Turning to the scheme, essentially, it involves the creation of a central executive authority which shall establish a huge network of interconnecting mains between all the large power stations, existing or contemplated, and shall become a "middle-man," purchasing electricity from the producers and selling it to the distributors. In one respect the constitution of this authority will be as warmly approved by the industry as it was by Mr. Baldwin's audience—namely, in that it will not be a Government department. It will, however, be vested with compulsory powers of unprecedented scope; it will be able to "bring everybody into line." If this result is achieved, we may hope at last to see the end of

the parochial system which Parliament imposed upon this country by the legislation of the 'eighties, and which for 40 years has clung round the neck of the industry like Sindbad's Old-Man-of-the-Sea; but the Board is set a gigantic task, and will have an army of vested interests arrayed against it. Important national interests must necessarily over-ride local claims, but we trust that full justice will be done to all those undertakers, whether municipal or company, who have honestly endeavoured to provide the public with that service for which they were granted a monopoly by Parliament.

As we have surmised in these columns, it is clear that the provision of capital for the use of this new authority has been the perplexity of the Cabinet; it would now seem that the Cabinet has found the problem insoluble. Mr. Baldwin states that the Board must find the capital for itself; to enable it to do this, a Government guarantee will be provided. We here find one of the contradictions that appear in his speech. He says that the outlay on interconnecting mains will be remunerative, and that the cost of standardising frequency will be fully off-set by economy in the cost of generation; he indicates that the Board must earn interest and sinking fund on its expenditure, and that the surplus (if any) will go to reduce the charges to the distributors. If the outlay is so sure to be remunerative, why seek the assistance of the Exchequer? and on the failure of that quest, why grant a Government guarantee? Unfortunately, we see no hope of a return from long interconnecting mains—save at the cost of the consumers—and as for the standardisation of frequency, we remember that Mr. Philip Snowden, as Chancellor of the Exchequer, declared this to be in the national interest rather than that of the undertakings concerned, which could not be expected to incur a heavy and unremunerative outlay. The Board will be a middle-man with a profit to make to cover interest and sinking fund, which will constitute a new charge on the supply of electricity, thus making three profits between the coal pile and the consumer's terminals instead of one or two as at present. These charges, we are told, will be fully off-set by economies in generation; we fear that the hoped-for economy, on the contrary, will be more than off-set by the additional charges.

According to the invaluable statistical Return of the Electricity Commissioners, in 1922-23 the average revenue of all undertakings was 2.08d. per unit sold, whilst the cost of generation was 0.54d. per kWh generated—say, 0.67d. per kWh sold, the cost of fuel being about 0.40d. There are many electricity works of quite small output, whose total revenue per kilowatt-hour to-day is less than 1.5d.; on the other hand, many large undertakings, some of which are interlinked with other undertakings, are charging over 3d. a unit on the average for all purposes. As we have shown on previous occasions, saving in fuel cannot possibly affect the price materially except in bad cases. Only by reducing capital charges and improving the load factor can the price be effectively lessened. It is claimed that interconnecting mains will dispense with a large amount of stand-by plant, and will improve the load factor; but a large proportion of the existing stand-by plant is of obsolete and inefficient pattern, and the mains must be paid for, whilst little improvement of load factor can be effected by coupling large stations with similar load curves, and the loss in transmission over long mains must not be ignored. The suggested resultant economies in generation are therefore somewhat problematical, and it is not even certain that undertakings owning very large power stations can supply electricity more cheaply than those of quite modest dimensions. For example, Manchester, with plant of 209,000 kW, receives 1.32d. per kWh, whilst Luton, with 12,000 kW, receives 1.10d. It is true that the large stations use fuel more economically, and with a high load factor can supply energy at a low price, but as Mr. Baldwin most truly said in his address, the great need is to reduce the cost of distribution, and to cover fresh areas—yet the "single purpose" of this scheme is to reduce the cost of generation. The former is greater than the latter, and it is of little use to attack the minor factor whilst leaving the major severely alone. No wonder that the Prime Minister did not think that this scheme would be the salvation of industry!

The fact is that the politicians are obsessed by the one idea of cheapness—always cheapness—failing to realise that electricity supply, for power purposes at any rate, is already cheap in our great industrial areas. What is required is development, and it would be far better to spend a large sum (but modest in comparison with the millions required for this scheme) on the education of the public to the advantages that they can derive from the free and even lavish use of electricity, than to sink enormous capital in mains and in replacing plant of non-standard frequency. Over a year ago we expressed the hope that "the technical advisers of the Government will recommend a sane and sound policy, avoiding an unprofitable outlay, but spending freely where it is wise to do so." We do not feel that the scheme before us fulfils that hope. We fear that the Government has tackled the wrong end of the problem; it is embarking on an unprofitable outlay.

Let it be understood that of the interlinking of adjoining power stations we cordially approve; our objection is taken to the erection of long mains connecting widely separated areas. In countries where water power or coal is available only in remote localities, such long mains are indispensable, but in this country that condition does not obtain—coal is available almost everywhere, and there is no necessity to transmit large blocks of power over great distances. Lancashire, already supplied with cheap power, will gain nothing from connection with the North-East coast or the Midlands, and *vice versa*.

The large expenditure contemplated would be more profitably devoted to assisting the electrification of our railways, which would at the same time carry electricity supply into the rural areas.

Research in the United States.

A BULLETIN has been issued dealing with the expenditure of the United States on research; her industries spend about 35 million dollars per annum on co-operative laboratory research, and it is estimated that this results in a saving of approximately 500 million dollars. By those who make use of the facilities offered, the outlay is regarded in the light of a sound and profitable investment; they find that it pays them extremely well. It is deplored that the value of the service proffered is not universally recognised; there, as here, there are powerful interests which stand aloof, showing that after all Britons hold no monopoly of stupidity. What is really of moment to British industries is not the fact that certain Americans are less alive to their opportunities than is supposed, but that the majority are alert and progressive, in no direction more so than as regards their attitude to research.

In many instances there is hearty and effective collaboration between industrial plant and university, between workers in applied and pure research. It is sufficient to read the records of such manifold and valuable researches as are described from time to time, for example, in the pages of the (American) *General Electric Review*, to realise how important a part scientific inquiry for practical ends plays in the development of the staple American engineering industries. Research is with them no luxury stunt; it is deemed to be a sheer necessity.

British engineering must not be allowed to lag behind in this respect; it will do so to its own increasing detriment. Much good work has been done, and is being done, alike at the N.P.L. and in commercial laboratories. Various research associations are holding their own, if doing little more. One or two, such as that of the electrical industries, are forging ahead. Taken as a whole, however, there is occasion for serious stock-taking. Much better things are possible; much closer attention to the real needs of the situation is called for.

As a nation we are faced with keen and well organised competition. Abroad the scientific spirit, as an aid to industry, is freely cultivated. British steel manufacturers, for example, have a hard fight before them. Not less, but more reliance upon the researches of expert metallurgists is a vital necessity. We have to hold our own—nay, to excel.

Thus the prime requisite is that Britain shall emulate her over-the-seas cousin, and in capitalising research, that she shall do so with no niggard hand.

The Protection of Investors.

THE frequent references in our own columns and in those of certain financial dailies, warning the public to be on their guard against invitations received through the post to invest in certain extremely weak and undesirable electricity supply companies, have not succeeded in entirely stopping the issue of such invitations. As we have repeatedly said electrical men (and women) who are familiar with electricity supply matters and the main essentials to success of electricity undertakings, are unlikely to be led astray by primitive and obviously misleading prospectuses, and their peculiarly-worded accompanying communications; the victims are seemingly innocently-minded and unsuspecting individuals who have no occasion to read either the electrical or financial Press, and who in their effort to make a slight increase in their meagre incomes in these hard times have reposed their trust in unknown and unworthy advisers, and have awakened after a short time to find that they have lost their money. It is in the interest of electricity supply and, indeed, all forms of legitimate enterprise that everything possible should be done to lessen the activities of postal "share-pushers." The President of the Board of Trade was questioned on the subject in the House of Commons recently and he undertook to bring the subject before the Committee which is considering possible amendments to the Companies Acts. Mr. Waldron Smithers who put the question has been interviewed by the *Financial Times*, and he has mentioned the possibility of introducing a licensing system which would enable a "black list" of undesirable circularisers and of doubtful shares to be kept. Only expert investigation can decide how far such a system could prevent the wholesale victimisation which appears to be prevalent at present. In one part of the interview with Mr. Smithers it is revealed that one method which has been employed for inducing people to part with their life savings has been to offer shares "in a particularly good electrical concern" at slightly under market price. "On payment of 1s. fee at Somerset House the names of people interested in electrical companies are ascertained and they are circularised to buy the shares in the company of standing. On application prospective buyers are informed that the shares which were on offer have been sold, and the firm then tries to interest them in something else it is anxious to dispose of." Mr. Smithers advocates that the widest publicity should be given to such methods. We fully agree, and if only our highly organised newspaper Press from one end of the Kingdom to the other would shoulder this responsibility it would be serving the real interests of its millions of readers in a way which is open to nobody else, and bring to itself far greater credit than is due to it for sensational and kindred stunts.

Registered Contractors.

WE wish to direct the attention of our readers to the very interesting article relating to the position and progress of the movement for the registration of electrical contractors which appears on pages 130 and 131 of this issue. We are indebted for this statement to Mr. P. V. Hunter, C.B.E., the Chairman of the Executive of the National Register. It will be observed that down to December last 804 applicants had been admitted, and 50 others were then under consideration. But it will also be seen that there are still a large number of eligible contractors who are, for some reason or other, holding back. Mr. Hunter tries to clear away some of the sources of misunderstanding that exist regarding the objects of the movement, and we trust that the publication of his article will stimulate interest and increase the rate of applications for membership. In another part of this issue we also give publicity to the list of contractors whose names have been added to the register since the summer of 1924.

Coal, Power, and Transport.

ON Thursday last week a grandiose scheme for the co-ordination of coal mining, the generation of electric power, the production of coke and smokeless fuel with recovery of the attendant by-products, and transport, was submitted to the Royal Commission on the Coal Industry by the Miners' Federation. The scheme essentially involved the nationalisation of all these important industries under the control of a Government Commission endowed with autocratic powers, attached to the Board of Trade. In place of the Electricity Commission there would be a "Power and Transport Commission" consisting of six full-time Commissioners, which would deal with the development of power (including coal) and transport; there would also be a "National Coal and Power Production Council," to control the organisation of the industry as a board of directors, and provincial councils, pit and works committees, and a consumers' council were provided for, as well as a separate export commission which would purchase coal and export it. It appears that the miners themselves would be heavily represented on these various bodies.

The collieries would be purchased at market values, by the issue of Government stock, or by a guaranteed national loan.

The scheme included the generation of electrical power at or near the mines, largely from refuse fuel, and the use of gas for producing electric power, as well as the adoption of low-temperature carbonisation, was contemplated.

One cannot but admire the calm effrontery with which this preposterous proposition was laid before an astonished public. The scheme was said to represent the views of a joint committee of Labour organisations; it is impossible to believe that it was ever meant to be treated seriously, and the only apparent purpose with which it was launched must have been to divert attention from the fact that the miners had put forward no concrete proposals for restoring the coal mining industry to a healthy condition. It has expired in a burst of laughter.

The Market in the Dutch East Indies.

ON another page is printed a statement showing the imports of electrical and allied material into Java and Madeira. It will be seen that in spite of the importance of the market in these two prosperous islands of the Dutch East Indies, the share of Great Britain in the electrical trade is practically negligible. Yet the purchasing power of Holland's East Indian possessions is growing rapidly owing to their exportable surplus of many agricultural and mineral products, *e.g.*, rubber, sugar, tobacco, cinchona, coffee, tea, oil, and tin, for which the world's demand is either increasing steadily or at least very stable. The population of the islands is roughly fifty millions. Of these about 35 millions are to be found in Java, among them over 135,000 Europeans. Whilst the figures to which we draw the attention of British exporters desirous of finding promising outlets for their goods, refer to the most populous and highly-developed portions of Holland's colonial empire, there are other regions which show great promise of agricultural and commercial expansion. In Sumatra vast schemes are being undertaken for the cultivation of rubber, coffee, tea, and cinchona, whilst in South East Borneo iron ore deposits have attracted the notice of capitalists. In the Celebes there is a project for utilising water power in the manufacture of fertilisers.

It would therefore appear that the market is worth the serious attention of British electrical manufacturers and traders.

Another Automatic Converter Sub-Station.

Demonstration of Reyrolle-Mather & Platt Equipment at Park Works, Manchester.

THAT the advantages of the automatic operation of converter sub-stations are being appreciated is evident from the fact that, whereas four years ago no such plant existed in this country, there are now a number in service, and at least six firms have manufactured, or are prepared to supply, equipment of this class. The increasing importance that this type of plant is assuming offered an opportunity last week of examining with much interest a rotary-converter equipment in-

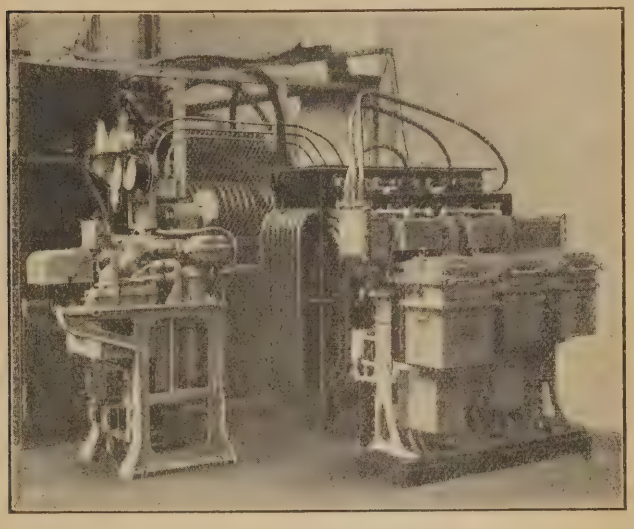

Fig. 1.—H.P. Switch, Transformer, and Starter Panels.

stalled at the Park Works, Manchester. The sub-station comprises a 500-kW self-synchronising rotary converter by Messrs. Mather & Platt, Ltd., with completely automatic control gear by Messrs. A. Reyrolle and Co., Ltd., and a transformer by Messrs. Ferranti, Ltd.

Like other automatic control equipment produced by Messrs. Reyrolle, this is an entirely metal-clad job with a minimum number of relays, all of fundamentally simple type. The main h.p. switch panel is shown in fig. 1; it consists of a standard 6,500-V, compound-filled, metal-clad panel of the horizontal draw-out type "C," with a normal rupturing capacity of 75,000 kVA, provided with a 3-phase potential transformer on the incoming side, low voltage, overload, and earth-leakage protection with t.l. fuses. A simple drive by a small 3-phase motor standing on top of the bus-bar chamber makes adequate provision for electrical operation without interfering either with the draw-out principles or with hand operation when required.

The Ferranti transformer is placed immediately behind this switch, and the starting switchgear is arranged directly alongside the l.p. terminals of the transformer in a direct line between it and the converter, thus minimising the length of cable required for the l.p. connections and avoiding awkward cable runs. The starting gear (seen on the right in fig. 1) consists of three neat metal-clad, oil-immersed switch pillars of the Reyrolle 400-V mining class, arranged in line and provided with mechanical interlocks and solenoid operation.

Messrs. Mather & Platt's standard method of starting has been incorporated in this equipment; the system is particularly suitable for automatic control owing to its simplicity, the certainty and smoothness with which synchronising is effected, the ease with which the polarity can be controlled, and to its independence of external and internal variables, *e.g.*, temperature. It is not necessary to lift the d.c. brushes during the starting period, so that not only is one source of complication removed, but it becomes possible to fit the standard M. & P. simple and rigid brush gear with all springs and flexibles thoroughly shielded.

On the d.c. side a standard 3-wire machine panel with automatic reclosing circuit breakers has been provided, and the equipment feeds in to the d.c. shop network in parallel with the manually-operated equipment installed in the firm's main sub-station some hundred yards away. The automatic control panels are shown in fig. 2 mounted alongside the d.c. machine panel; one carries the indicating instruments and manual controls without which no Reyrolle automatic equipment is turned out; on the other panel is mounted the whole of the relays required for starting the plant by low voltage on the network, or through the agency of an astronomical time switch and the Reyrolle standard master timing device shown in fig. 3.

This is set to prevent the switch being started by momentary kicks; it energises the closing motor on the h.p. oil switch through the operation of the master relay. This operation cannot be effected, however, unless the a.c. low-voltage coil is first energised, its circuit being completed through all the main protective devices and through the auxiliary "police" switches indicating the position of the various starting switches and the d.c. circuit breaker. As the closing motor is a 3-phase machine, the fact will also be appreciated that it will not operate to close the switch if one phase happened to be lost, thus providing against single-phase operation, a further safeguard in this respect being provided by connecting certain of the a.c. relays to opposite phases.

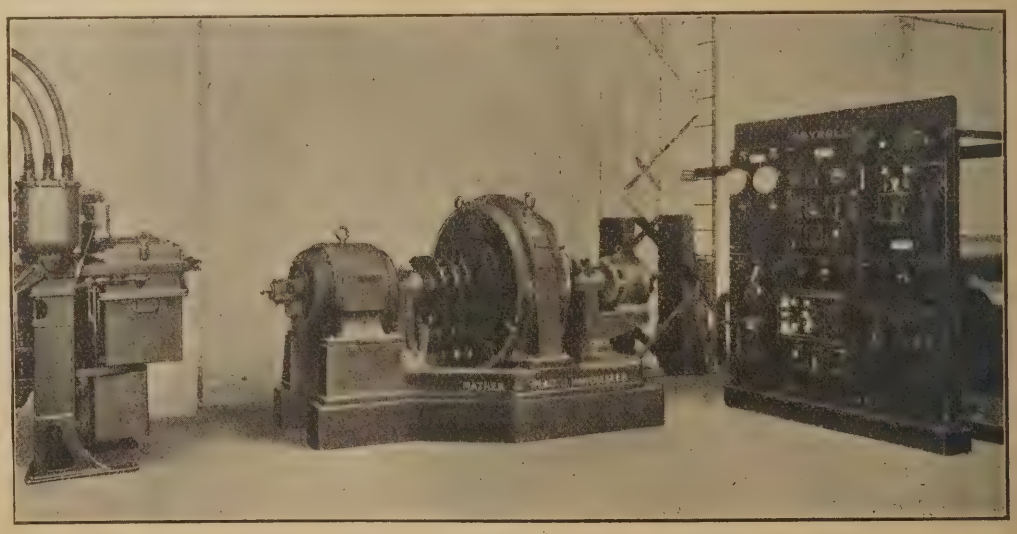

Fig. 2.—The Park Works Automatic Rotary Sub-station.

When the h.p. switch is closed, the transformer is energised, and the starting motor of the rotary converter is connected to the l.p. side of the transformer. The machine accordingly begins to accelerate and, the correct polarity having been determined by a suitable relay, the l.p. transformer connections are transferred

to the second (or synchronising) step; the machine now runs up to full speed, the main field winding is adjusted to the correct strength, and the machine brought into synchronism. The operation of the relay provided to prove synchronism closes the main (or running) contactor on the l.p. side, cutting out the starting motor, opening the contactors controlling it, and connecting the l.p. transformer leads direct to the slip rings; at the same time an adjustment is made to the field strength to give normal no-load voltage on the d.c. side, and

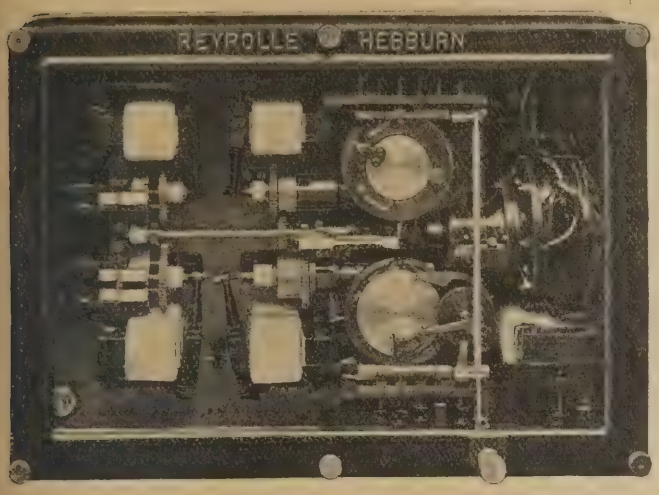

Fig. 3.—Master Control Device.

the discriminating relays controlling the operation of the main machine circuit breaker are put into operation.

If the load proves to be within the limits of the machine, these circuit breakers close, and the load is at once picked up. Underload and overload d.c. relays govern the operation of the set through the medium of the master timing device, which also incorporates in one common case all the time elements required for the whole equipment. In the event of a failure to synchronise for any reason, the set will shut down and will automatically start a second, and then a third, time before finally locking itself out.

The time taken to get the rotary on load is remarkably small, being considerably under one minute. The converter is equipped with an exciter and with bearing-temperature and overspeed devices of Messrs. Mather and Platt's own design and manufacture. The polarity is at present determined by the exciter, but an alternative scheme was demonstrated to us which allows of the correct determination of the polarity without the use of an exciter.

A feature of Messrs. Reyrolle's equipment is that each individual piece of main apparatus controlling the plant is not only provided with a handle, but is definitely made for normal hand operation, as well as fully automatic. This is a point which will be appreciated, for it provides easy facilities for overhaul and efficient examination by the inspection staff. The relays are all of the plain electromagnetic type, with lift and fall armatures carrying visible contacts, and are enclosed in dust-tight cases of uniform design with glass fronts to show the interiors. The master timing device illustrated in fig. 3 is an ingenious adaption of simple principles, and comprises a single main shaft driven at a speed of approximately three revolutions per minute, to which are connected, by electromagnetic clutches controlled by the various relays, simple trains of gearing which drive graduated cams that operate robust visible contacts. The range of timing offered by this piece of apparatus is such as to provide an ample margin to satisfy the varying conditions met with in practice.

In conclusion, it may be remarked that we were also shown a smaller converter set in the works which is completely controlled from a distant point with the aid of pilot wires and switching apparatus of the type made by Messrs. Bertram Thomas, similar to that illustrated in our issue of October 17th, 1924.

The Comines Power Station.

A French Central Station using Pulverised Fuel.

By THEODORE RICH.

(*Concluded from page* 88.)

Water Services.

In many parts of Flanders the question of feed and other water supplies gives rise to difficult problems, especially as nowadays a steam station has so many auxiliary services requiring water besides the boiler feeds; for instance, the cooling of air which passes through the generators, the cooling of the turbine circulating oil and that of the transformer coils, also supplies of drinking water. There are two sources of water supply at Comines—one from the River Lys, drawn from the circulation pressure pipes, and the other a tube well sunk 190 metres (623 feet) deep, into carboniferous limestone. The former water, in addition to its use for condenser circulating purposes, is used for the cooling of the evaporator auxiliary condenser and for fire service. The well water is used to supply the workmen's cottages and the station with drinking water, and can be used as an alternative for other services. A pump house is fitted on the ground floor, containing centrifugal pumps, which are used for the different services; it also contains the distilling plant. Three tanks are arranged—two of 65 cubic metres (2,280 cu. ft.) capacity and one of 20 cubic metres (702 cu. ft.); the two former are used for raw river or well water, the latter for distilled water. A water softener of the Demouly-Lamy type, of a capacity of 40 cubic metres (8,800 gallons) per hour is arranged to work intermittently; the water is then passed into a settling chamber of 300 cubic metres (9,350 cu. ft.) capacity. A tank of the same capacity is fed by the distillers, this water being used for cooling the transformers and reactances, the cooling of this water being by means of sprays.

There are four Sulzer centrifugal feed pumps; three of these are driven by high-pressure steam turbines and the fourth is operated by a three-phase motor running at 220 volts. Each has a capacity of 200 cubic metres (4,400 gallons) an hour under a pressure of 23 kg. per sq. cm. (327 lb. per sq. inch). These pumps have their suctions under head in the feed tanks, which are supplied from the condenser. The pumps have excess pressure valves which release back into the feed tanks.

In order to eliminate trouble through scale in the boilers or in transformer and other cooler coils, a Kestner multi-effect distiller is arranged, which will be described at a later date. The steam supply for the heating comes from the exhaust of the Sulzer turbines which drive the feed pumps. The output of the distiller is passed through a Lea Recorder.

Piping System.

The steam pipes are of solid drawn steel, with circular loop expansion rings. There are two independent lines of mains running at the back of each line of boilers, terminating in steel separators, and a double header running along a covered alley way between the boiler

houses and the turbine house; there is a duplicate supply up to the turbine separators. The pipework is covered with a composition made up of 85 per cent. Newalls sulphate of magnesia and 15 per cent. fibrous asbestos; the insulation of the pipe joints is made removable. Steam meters of the type made by the American General Electric Co. are fitted. The feed pipes to the economisers form a double ring; they are fitted with Worthington-type water meters.

The Driving of Auxiliaries.

In accordance with a practice very usual in France, separate generating sets are provided for the driving of the auxiliaries; two Rateau-Schneider-Thomson-Houston turbines have been installed running at 3,000 r.p.m., one of 3,500 kW and the other 5,200 kW (these were illustrated in fig. 14, p. 62, in the issue of January 8th). The generators are wound for 10,500 volts, and are connected to a special auxiliary switchboard placed quite apart from those of the main station.

The auxiliary bus-bars are in duplicate, and in case of accident, by means of oil switches, they can be connected to a set of duplicate local supply bus-bars, which are supplied by step-down transformers 45,000/10,500 volts from the main station bars, these local supply bars being connected to certain outgoing feeders at 10,500 volts.

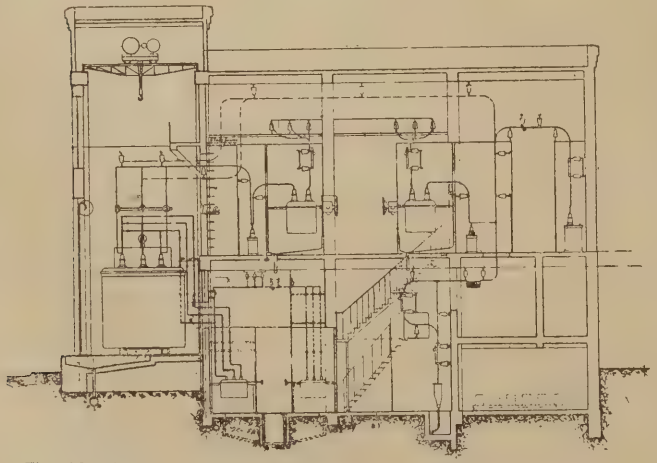

Fig. 18.—Vertical Section of Transformer Station at Tourcoing.

To these auxiliary bars are connected 10,500/220-V, 2,000-kVA transformers for the operation of those auxiliaries which are run on three-phase current; for instance, the fans for the chain-grate stokers, the Prat induced-draught fans, and the pulverisers; a set of two 1,000-kVA transformers for the river pumping station; and a set of transformers for operating the rotaries. The station and other overhead travellers, the coal transporters, elevators, and belt conveyors are operated with direct current at 230 volts from two 500-kW, 1,000-rev., six-phase rotary converters, shunt wound and fitted with centrifugal trip gear. For the emergency lighting and the operation of the auto-switchgear, a 350-ampere-hour, 110-volt iron-nickel battery is provided, charged by means of a 12-kW asynchronous motor-generator.

Transformers and Switchgear.

A house for transformers and switchgear runs the whole length of the main buildings; it is 28.4 metres (33 ft. 3 in.) wide, and is separated from the main bay of the turbine house by a passage arranged so that the transformers can be run on to a trolley from the cells in which they are placed and run out of the building. Each cell is fitted with roller shutters. This can be seen from the section of a similar building, fig. 18. The operating board is placed above this passage.

Each turbo-generator is connected to three single-phase transformers, each of 10,500 kVA, 10,500/45,000 volts; the low-pressure side being in delta and the high-pressure in star.

There are three sets of bars—one for coupling, one set of main bars, and an auxiliary set. Each group of step-up transformers is connected to an automatic oil switch fitted with differential relays for the protection of each alternator, and a wattmeter-type relay which comes into action in the event of bad paralleling. Connection is made by three remote-controlled switches to the three sets of bars, the connection to the coupling bars being through reactances. The main bars are

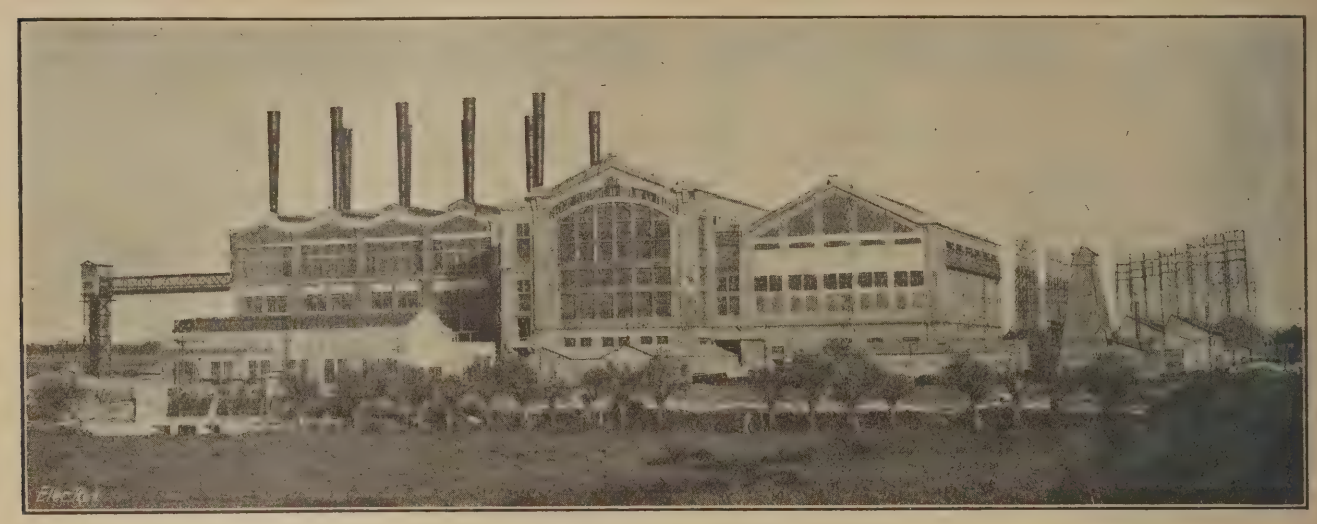

Fig. 17.—General View of Comines Power Station.

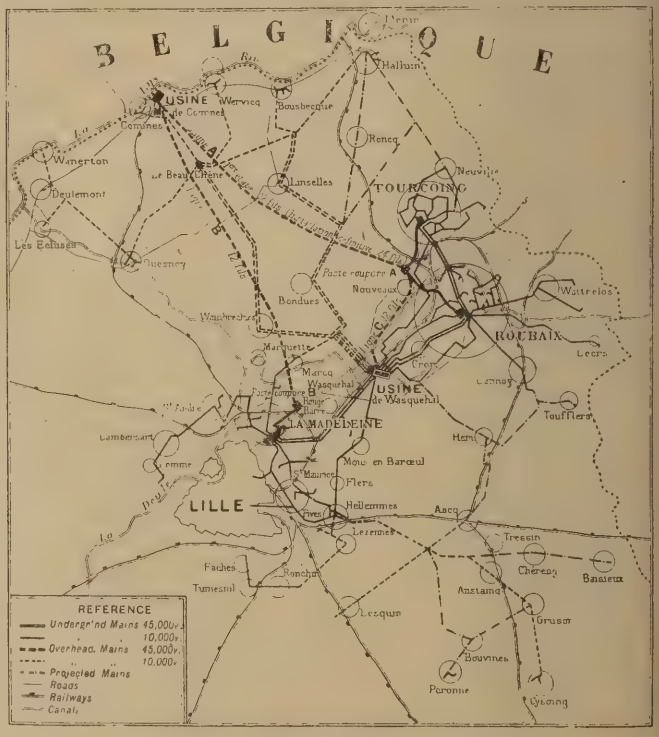

Fig. 19.—Plan of the Network of the Company.

sectionalised so that, if desired, the Roubaix-Tourcoing section can be run separately from the Lille section. Each feeder is connected to the main and auxiliary bars by means of two automatic switches; protection is given to each feeder by means of water-jet limiters and horn dischargers fitted with liquid resistances. With the aid of the auxiliary bars, should the automatic switches on a feeder come out, it is possible, by means of a regulating transformer, gradually to raise the pressure on it to see if there is a permanent fault.

The electrical end of the main turbo-generators, the transformers, and the switchgear and appliances were supplied by the French Thomson-Houston Co.

Auxiliary Buildings.

A workshop about 100 ft. long by 33 ft. wide is provided for general repairs; it contains tools and equipment for general electrical and mechanical work, with a forge, coppersmiths', and woodworking shops. In an annexe to the main building lavatories and shower baths are fitted. In view of the difficulty of getting accommodation in the neighbourhood, a number of houses have been put up for employés, each block consisting of four dwellings, each with a strip of garden.

Transmission Lines.

Fig. 19 shows the trunk lines. In the direction of Roubaix-Tourcoing there are 12 stranded conductors of copper, 105 sq. mm. (0.163 sq. in.) section. Fig. 20 shows the type of standard used, the normal span being 65 metres; the standard is set in a block of concrete. The top conductor is fixed about 38 ft. and the lowest about 30 ft. from the ground. The main uprights are made up with four braced angles 60 × 60 × 6 mm. (2.36 × 2.36 × .23 in.), on a base at the ground line of 1.200 metres (3 ft. 11 in.). The earth wire is of double-galvanised stranded steel of 35 sq. mm. (0.05 sq. in.) section. The insulators for the 45,000-volt lines are tested to 140,000 volts in the dry. The distance between the conductors is 1.25 metres (4 ft. 1½ in.) horizontal and 1.35 metres (4 ft. 5 in.) vertical. A wire guard is put up between each section of six conductors at the supports, so that one section can be got at safely while the other is alive.

There is a 6-conductor line towards Lille, which has running alongside it most of the way a similar line

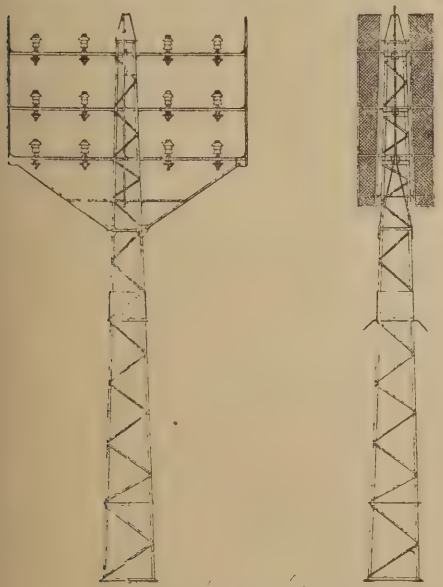

Fig. 20.—Steel Standards for 45,000-Volt Line.

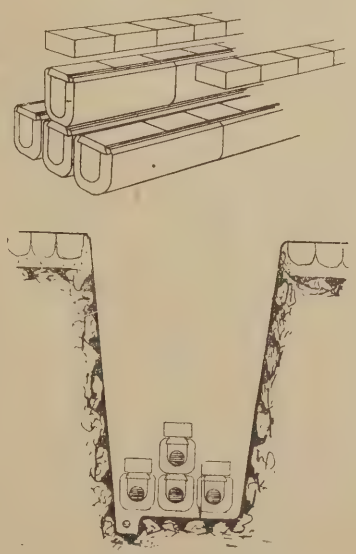

Fig. 21.—Section of 45,000-Volt Underground Mains.

built by the State to link up with a main trunk line running between Valenciennes and Lomme, which is to the west of Lille.

Outside Roubaix-Tourcoing and Lille indoor switching stations are arranged, with incoming and outgoing feeder auto-switching gear and protective apparatus. From the former station aerial lines make connection with the Wasquehal power station. From these two stations to the three main sub-stations 45,000-volt cables are laid. To Roubaix four single-conductor cables of 340 sq. mm (0.53 sq. in.), 3.5 km. (3,828 yd.) long, to Tourcoing 2.35 km. (2,570 yd.) and 150 sq. mm. (0.23 sq. in.), and to La Madeleine-Lille 1.69 km. (1,748 yd.), also 150 sq. mm.

The single-core cables are insulated with paper and covered with lead, then surrounded by an insulating compound and two layers of tarred paper, the whole being served with impregnated jute. These cables,

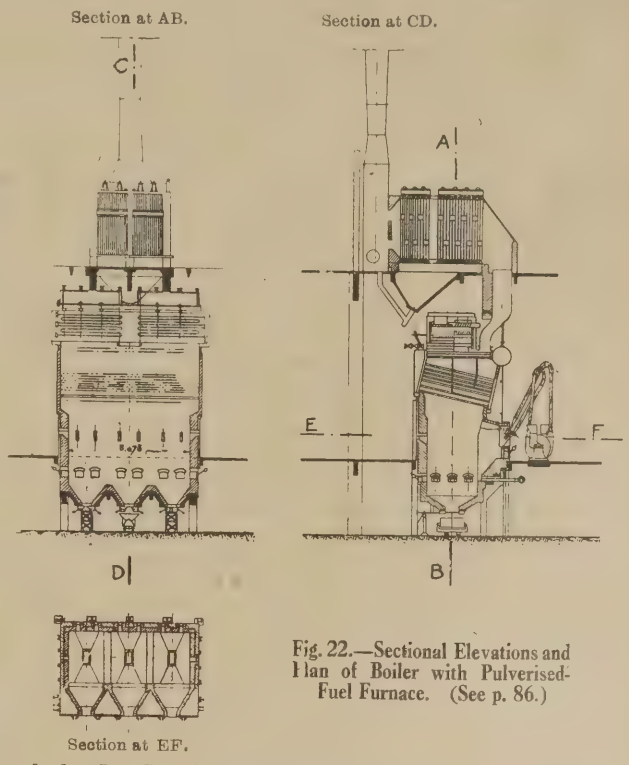

Fig. 22.—Sectional Elevations and Plan of Boiler with Pulverised-Fuel Furnace. (See p. 86.)

made by La Canalisation Electrique, of Saint-Maurice, were tested before delivery to 80,000 volts for five minutes.

The four cables are laid in a trench in concrete troughing, as shown in fig. 21. The three cables at the bottom have equal spacing, and the height of the fourth reserve cable above the axis of the bottom centre one is the same as the spacing of the three below. The bottom cables are transposed into sections of one-third the length, each conductor occupying in turn the positions of right, centre, and left; the top reserve conductor runs right through. With this disposition, all the coefficients of induction of the different conductors balance out, and there is no action on the copper or lead sheath of the spare conductor. At Roubaix, Tourcoing, and La Madeleine-Lille indoor transformer sub-stations are arranged (naturally inside cities the land for outdoor sub-stations would be very expensive). The transformers are arranged in 5,000-kVA units, 45,000/10,500 volts. A cooler and a detartariser for the transformer circulating water are placed on the flat roof of each sub-station.

A small battery of accumulators is provided for the operation of the trips. In order to improve the power factor of the system, some 6,000-kVA synchronous condensers have been installed recently at suitable points.

The design, construction, and equipment of the Comines station and of the transmission lines and sub-stations were undertaken by the Société Générale d'Entreprises, of Paris, one of the largest electrical contracting concerns in France. The thanks of the writer must be given to that company, and particularly to M. Duval, their electrical engineer, and to M. Orengo, the central-stations director of the "Energie Electrique du Nord," for help in the preparation of these notes.

Hydro-Electric Power in Argentina.

Development of the Iguazu Falls.

By PERCY F. MARTIN, F.R.G.S.

UNLIKE its neighbour, Brazil, Argentina is but poorly endowed with natural waterfalls; the one source of real potential importance, the falls of the Iguazú, belongs territorially as much to its neighbour as to Argentina, forming, indeed, part of the common frontier. For at least two decades the question of joint utilisation of the falls has been mooted, and it may be stated now with some authority that use is about to be made of them by both Governments, and in connection with this an official announcement will be made at no distant date. It is proposed to build four lines, each sufficiently powerful to carry the full load, so that if any one should break down or be interrupted, there would be no complete cessation of the supply. Preliminary estimates of the expenditure place the figure at between $50,000,000 and $60,000,000 gold (£10,000,000 and £12,000,000) for supplying Buenos Aires with a *per capita* supply of 500 kWh a year, at a cost of 60 per cent. of the present rates, while the actual work of construction would occupy, perhaps, two-and-a-half years.

An Iguazú hydro-electric power scheme is by no means new. It has been visioned by successive administrations of both States, while, as far back as August, 1919, something like a definite project was put forward at the instigation of Dr. Honorio Pueyrredón, at that time Minister of Foreign Affairs, and now the Argentine Ambassador to the United States. A satisfactory feature of the proposal put forward was that when—if ever—the projected exploitation of the Falls of Iguazú came about, both Argentina and Brazil would work hand in hand to the mutual advantage of their nationals. Since then both Governments have devoted funds for the purpose of preliminary scientific investigations, and they have come to the mutual conclusion that the time is now ripe when commercial exploitation of this vast untouched water supply could be successfully carried into effect. So far as early, but necessarily incomplete, examinations of the commercial possibilities of the Iguazú Falls have proceeded, it seems that some 150,000 h.p. (subsequently to be increased to 300,000 h.p.) could be obtained, sufficient to supply the city of Buenos Aires with about 125,000 kW during ten months of the year, that is to say, about 80 per cent. of the energy produced. The remainder could be distributed *en route* to the second most important commercial town of Argentina, Rosario de Santa Fé, which would be connected up by means of a branch transmission line. The one adverse factor is the unavoidable partial service available during the dry season, when the quantity of electrical energy would have to be reduced to a maximum of 75,000 kW, thus rendering it necessary to provide an auxiliary power installation by means of coal or oil fuel which would be capable of supplementing the hydro-electric works. At the same time, it is considered possible to further increase the quantity of energy supplied by the falls of the Iguazú by the construction of a number of dams, not provided for in the engineers' original estimates.

Most of the course of the Iguazú river forms the boundary between the Rio Grande and Santa Catharina States, of Brazil, and the State of Misiónes, on the borders of Argentina, and at its mouth are located the falls of the same name as the river The only navigable part of the stream (from Puerto da Uniao to Puerto Amazonas) is in Brazil. The actual falls are 1,200 km. (approximately 750 miles) distant from the city of Buenos Aires, and the question has been raised whether it is possible to successfully transmit the energy over such a distance. Water power must, generally speaking, be developed where it is found, while fuel power can be developed where it is wanted. There must of necessity be a loss of power in transmission, while in regard to cost, not only must the plant be larger in order to deliver the required power over and above the loss, but the transmission lines must be paid for and maintained. By a prodigal expenditure, such as would have to be taken into consideration in relation to the Iguazú scheme, the losses in transmission can be made low; but this does not necessarily mean a saving in the total cost of transmission if the additional annual charges are thus unduly raised. The progress that has been made within the past few years, however, in the construction of transformers, &c., required for transmission at 220,000 V, has placed the proposal of transmitting energy over the distance referred to well within the bounds of realisation. It appears, however, from what the engineers have finally reported, that the distance to be covered between the falls and Buenos Aires cannot be shortened by any feasible means. It has been definitely decided that in drawing up the necessary calculations and conclusions, the higher voltages must be allowed for. Distance, however, beyond the heavy outlay involved by the transport of plant and material through jungly country without roads, offers no obstacle; this has been proved in numerous other similar cases, notably the transmission of energy over a length of 450 miles in Southern California, and, in another instance, where transmission has been carried over a distance of nearly 1,000 miles. It is calculated that the Iguazú Falls could be harnessed so as to provide 500,000 h.p., one half of which would go to Argentina (where, besides the city of Buenos Aires, the territory of Misiónes and the two provinces of Corrientes and Entre Rios could be brought within the scheme of supply), and the other half to Brazil.

The Falls of Iguazú consist of 275 cascades, one of which has a sheer drop of 260 ft., compared with Niagara's highest fall of 160 ft. One of the most costly items to be met in carrying out the enterprise would be the clearing of land on the Brazilian side of the falls, which are at present nothing but jungle. The vegetation is so prolific, and the rains are so heavy and abundant, that special thoroughfares would have to be made, and, when constructed, kept in order at a very heavy outlay. The question of labour would be less difficult to solve, since there is an almost unlimited number of native hands available both on the Argentine and the Brazilian sides.

The Iguazú is not the only potential source of electric energy in Argentina. Investigations have shown that the waters of the Salto Grande, north of Concordia (Argentina), and the Salto (Uruguay) could be utilised, so that the neighbouring states could obtain from the falls a supply of not less than 50,000 h.p. In the Department of San Rafael the Atuel falls could be utilised to provide sufficient energy to electrify the system belonging to the Western Railway. In Argentina, where, as indicated, no waterfalls are available, and wood, coal (imported and native), and petroleum are extremely costly, the only solution of cheap fuel provision is for factories to group themselves about central stations of large capacity, and take their supplies from them. These installations, furnishing many thousands of kW, could supply at rates far below the cost of electricity produced upon a small scale by means of isolated plants. Indeed, in Argentina the rates are not high if considered from a comparative point of view, and for a country which has earned the reputation of being one of the most expensive in the world in which to live. The fact becomes the more notable when it is remembered that practically everything having relation to electricity has to be imported.

Initiating Mr. Smithers.

By "STAN DARD."

I WAS considering packing-up for the day when the bell summoned me to the Chief's office. As I wended my way there I cast about in my mind for any technical omissions I might have made recently, for, as a rule, a summons to the Chief's office meant but one thing: that there was "something up." I had satisfactorily gone through two recent jobs by the time I had reached his sanctum, and as I opened the door I began to marshal the facts relating to one not quite so favourable. My trend of thought was upset by the unusual aspect of my Chief.

He was seated, as might have been expected—true; but his customary highly-critical demeanour seemed to be lacking. His gaze, usually of an e.h.p. quality and directed point-blank at the arriving victim, was unexpectedly mild (even irresolute), and it was lingering upon someone else. The latter was a young fellow, who (remarkably enough) appeared perfectly at ease. Indeed, a chance onlooker would at once have identified him as the most impressive character in the room.

"Oh—er, Dard," said the Chief, turning towards me. "This is Mr. Smithers, who is joining us for an insight into our—er—work. I'd like you to take him along with you to-morrow and initiate him. You might as well be getting on with these four jobs."

On the following morning I had some difficulty in locating the latest arrival, and eventually found him, in a state of abstraction, behind "The Wireless Herald." He appeared somewhat taken aback and (to my relief) not quite so impressive as on our first meeting.

"We'd better be getting along," I hinted. "By the way," I went on, "I wouldn't advise you to wear such good togs on our work. The jobs to-day, for instance, are a bit rough-and-ready, so to speak."

"Oh, that's all right," he hastened to assure me. "I know what electrical work is like."

During our run to the first place I gathered that Smithers, after leaving college with a technical degree, had found some difficulty in adapting himself to the practical world. Yes, electrical work appealed to him. He seemed, though, to be under the illusion that electrical conditions were just a kind of magnified lab. work. Our first halting-place was in the nature of a rude awakening. It was a flock factory. Here a number of carts were unloading sackfuls of rags, which were first placed in ovens. Inside the factory proper were a number of machines looking very much like a.c. generators, the rotors, however, bearing nasty-looking spikes; into these machines the rags were fed, to emerge from the tearing process as flock. They were driven by electric motors, and, as I explained to Smithers, our job was to investigate the electrical conditions following on the installation of some static condensers.

Smithers, however, was in no mood for technical matters, and as time went on his interest decreased to zero. This was understandable, and due to a detail which I have neglected to mention. The atmosphere of the factory was stiflingly hot, and full of tiny, irritating fragments of flock. These had filled all the crevices in the walls, and every article in the place bore deep layers of flock—the Supply Co.'s meters and cables being especially favoured. Smithers' discomfort impelled him to retire from the scene, coughing and itching. Having arrived at my power-factor and other details I, too, hastened to leave. Smithers was conversing with the foreman. "Been long here?" said the latter, with a hearty and fluffy laugh. "Lor' bless yer, fourteen years!"

For some miles Smithers was silent but still *restless*. At last he enquired as to our destination. I told him: a soap and candle works. I added that there was no reason to expect an atmosphere like the flock factory's. This was not altogether fair, because the atmosphere we presently entered more than made up in aroma for what it lacked in solid matter. Our technical work here dealt with the metering; the works was on a day-and-night tariff, and as the day meter had gone on strike and the night meter was working a 24-hour shift, the works was receiving all energy at the cheaper rate. When the fault was cleared and we reached the fresh air, Smithers expressed the view that it was a wonder *anything* worked in such a place. "Besides," he added, with some indignation, "what do people want with candles nowadays? Soap I suppose we need, but candles . . .!"

When he heard that the next job was down a pit he cheered up surprisingly. I hinted that we'd have some work to do—as a matter of fact we got more than I bargained for. At the pithead we met the electrician and had a long and cold wait while a "set" of tubs was hauled to bank. I donned overalls and cap, while Smithers elected to retain his top coat in lieu of dungarees. At last the banksman nodded us into the cage.

The cage dropped and Smithers gasped. The shaft was a wet one, and water splashed into the streaming cage. Smithers's top coat was not so out of place after all! At the bottom we paused awhile to attune ourselves, the onsetter regarding Smithers's trilby and top coat with frank amazement; then, burdened with current transformers, instruments and lamps we set off inbye—the electrician leading the way. For a while we clambered and splashed over tramlines in a main road. The roof lowered, and abruptly we turned right, down a steep incline. Bent nearly double, and half-slithering, half-walking, I managed to keep in sight of the electrician. Behind me I could hear Smithers stumbling along. I was perspiring freely and did not envy him.

The electrician halted. We had reached our objective—a wet and dimly-lighted pumphouse. Here was a pump driven by a 60-h.p. electric motor, the working conditions of which were to be investigated. Smithers was exhausted and sad, and, I am afraid, was not of much help. I do not think he was able to reconcile his expectations to the crude actuality. The investigation was duly completed, in spite of water and bad light and Smithers's wilting state. After a hard climb back to the shaft-bottom, and another wet journey to bank, we were once more on the surface, and on our way to the last job.

Smithers seemed to be thinking hard, and at last affirmed that he would never again criticise miners. After another spell of thought he went on to say (frankly if ingenuously) that electrical engineering (or to-day's sample of it) was not what he had expected. When I gently made the inevitable rejoinder he hesitated, and his answer, beginning with a floundering attack upon his technical education, ended by a confession of his espousal of wireless. (No wonder he had, earlier in the day, been so contemptuous of our local frequency of a mere 50 cycles!) He was commencing a description of his latest "super-het" when the increasing flavour of the air informed me that our last destination (a glue factory) was nigh.

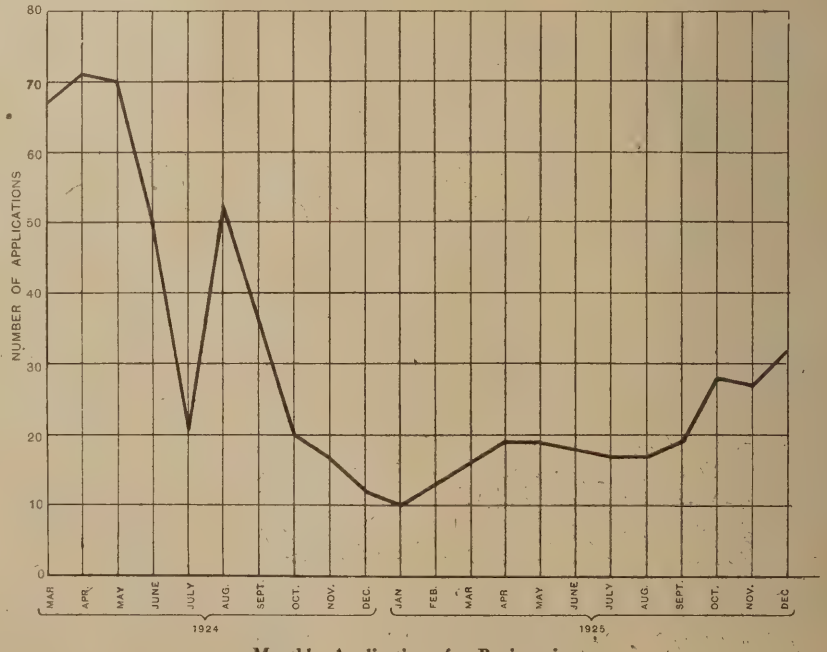
Smithers was visibly reluctant at entering, but during a breather in the office he must have pulled himself together, for when I appeared with the engineer he followed us with no apparent hesitation. The technical trouble here lay in the fact that the normal maximum demand had suddenly risen. The engineer's ideas anent his hourly max. demand were hazy—as often is the case. Having examined the demand indicator and found it in order, by some judicious inquiries we elicited the real cause: their gelatine section, long disused, was starting up again.

Our wanderings took us through an atmosphere hot

and stinking. At one place we passed a mysterious tank around which a dense crowd of big flies were busy. Hides, skins, and bones were being melted in open boilers, and the glue-stock boiled in water. In wooden congealing boxes the gelatinous fluid formed into stiff jelly, after which it was cut up and dried. All these interesting operations were marred by the stench. As Smithers (looking sick) and I hastened to depart, the engineer, with an air of pride, showed us a sample sheet of glue, and explained how the beautiful polish was obtained by re-dipping in water and again drying. "A fine bit of stuff," he said, passing his hand lovingly across it. "If ever you want a good piece of glue, just you come along here."

On our homeward journey Smithers contented himself with a large number of abnormally deep breaths, and his "good night" was uttered in rather dejected tones. I forebore to press for an opinion of his day's experiences. I saw him next morning engaged in a confab. with the Chief, and from that day "our place" knew him no more. The Chief announced briefly that Young Smithers was not continuing with us.

Whom should I meet a week later but Smithers himself! He appeared supremely satisfied with existence. His greeting, whilst a trifle lordly, was tinged (I verily believe) with a certain respect—perhaps he admired my courage in professionally penetrating into noxious regions. He was now, it appeared, with a radio engineer and "doing well." I congratulated him on dropping into a more congenial sphere and, as we parted, I told him that there was one thing he need never want. He looked puzzled. Then I reminded him of the kind offer of the glue factory engineer: "If ever you want a good piece of glue, just you come along here." At that Smithers's face paled, a shudder passed over him, and he hurried away.



The Registration of Electrical Contractors.

The Present Position and Progress of the National Register.

By P. V. HUNTER, C.B.E., M.I.E.E., Chairman of the Executive of the N.R.E.I.C.

It may be opportune at the commencement of a new year to review the progress which has been made since the National Register of Electrical Installation Contractors commenced to receive applications in March, 1924, and to consider to what extent the ideals of those who originally laboured to establish it are being met.

Considering first of all the purely statistical side of the subject, it is interesting to find that a total of 930 installation contractors had applied for admittance to the Register up to December 31st, 1925. Of this total, 804 had been registered on that date, and 50 were still under consideration. The remainder (76) for various reasons were declined. The rate at which applications have been received, while showing occasional variations, has on the whole been gratifyingly regular. For the benefit of those who prefer to absorb such information in graphical rather than purely arithmetical, form the graph appearing herewith, showing the monthly rate at which applications have been received during the time the Register has been in operation, will be of interest. It is evident from this that there is no sign at present of a decided falling off in the rate of application.

Monthly Applications for Registration.

It is difficult to form even an approximate estimate of the proportion which the number of contractors admitted to the Register bears to the number of those who are eligible. The total number of installation contractors within the area embraced by the Register is not known, and estimates as widely different as 2,000 and 7,000 have been made. The smaller figure probably more nearly represents the number eligible for registration, as the larger one admittedly includes all those working electricians who occasionally purchase wiring material but have no established business or equipment. It is evident, however, that there are still many suitable contractors who have not been registered. The causes operating to prevent these eligible contractors from applying for registration are somewhat difficult to determine. It is no doubt a fact that some of the smaller contractors quite misunderstand the policy of the Register with regard to admittance. They are under the impression that the standard is set largely by the magnitude of the contractor's operations, whereas in point of fact quality of work and reputation are the real essentials, and provided that the minimum accommodation and equipment necessary to carry on as a contractor are in the possession of the applicant, the magnitude of his business is not such an important consideration. To some extent no doubt this erroneous impression has been fostered by the support given to the Register by the larger and better established firms. Practically the whole of the contractors of this class were admitted to the Register in its early days; they had little or nothing to gain in reputation by being registered, their principal object in applying being to help forward the cause of registration *per se*. It is to be hoped, therefore, that their action will not have the opposite effect to that intended, namely, of deterring eligible contractors from applying for admittance to the Register.

Another source of misunderstanding arises from the fact that many people have an erroneous impression of the object for which the Register exists. Those who have not given the matter more than casual consideration are apt to assume that the Register is a purely trade organisation existing for the benefit of those who are registered. This idea cannot be too forcibly contradicted. The primary objects of the Register are to

serve the public who employ wiring contractors by providing a list of names of contractors who can be relied on, and to raise and uphold the standard of good workmanship. For this reason wiring contractors are in a small minority on the Registration Board, the major portion of the *personnel* being nominated by various institutions representative of different sections of, and who are interested in the advancement of the electrical industry, so that both the public and the applicant for registration may be assured that the Register will deal impartially with applications, and that so far as can be foreseen none but competent contractors will be registered.

Registered contractors are of course entitled to the advantages which accrue to them from being registered, but that is not one of the immediate objects for which the Register was formed, though it is necessarily incidental, and the National Register is not therefore conducted as if it were. On the other hand, every endeavour is made by the Registration Board to ensure that the eligibility of a contractor for registration is, subject to compliance with certain requirements under the rules, judged purely on his merits as an installation contractor. In particular, too, academical consideration of the candidate's qualifications is avoided.

For this purpose the Executive Committee has the advantage of the co-operation of some 100 local advisory committees who can be relied on to report on the candidate's qualifications from personal local knowledge in a manner which could never be approached by a committee at headquarters. More are in course of formation, and additional ones will be formed where required. These local advisory committees each consist of three members, one representing the Institution of Electrical Engineers, another the electricity supply section of the industry, and the third member is a Registered Contractor. The assistance of these advisory committees has been of the greatest value to the Executive Committee of the Board, and has undoubtedly operated to the advantage of *bonâ fide* installation contractors.

At the present time the need for a National Register of Installation Contractors is more pressing than has been the case at any time during the history of the electrical industry. The last two years has seen an enormous expansion in the numbers of domestic installations wired for electricity supply. It is quite common experience for the number of installations connected annually to be four times that of a year or two ago, and the rate is still increasing.

In such circumstances it is obviously difficult for trained *personnel* to keep pace with the growth of demand. In particular, this rapid expansion has brought into prominence the jerry wireman who, without any business establishment or resources, undertakes domestic installations purely speculatively. Generally in order to get the business, the prices quoted have to be so low as not to permit of proper workmanship or material being employed. The National Register takes the greatest trouble to distinguish between such undesirable speculators and the genuine installation contractor who, although in a small way of business, is doing good honest work, and the latter class may submit their names to the Register with every confidence that they will receive proper consideration.

Householders who employ wiring contractors necessarily do so at such very infrequent intervals that they are seldom in a position to judge of the merits of any contractor they employ from personal experience, in the same way that they are able to judge other tradesmen with whom they are constantly dealing. The existence of the Register should therefore be of the greatest assistance to them. Many public bodies are so satisfied of its advantages that they have signified their intention of confining installation contracts to registered contractors, in order to ensure that a reliable job will result.

It is naturally the case with an organisation that has only been set up for such a short time, that the full effect of the existence of the Register has not yet been felt. The action and reaction between the purchasing public who find it advantageous to employ only registered contractors, and the increasing number of contractors who find it advantageous to register because of this employment, have obviously not had any marked effect in the short time during which the Register has been in existence, but they may be relied on eventually to ensure that the majority of contractors who are eligible will find it advantageous to register.

Legal.

Consolidated Electrical Co., Ltd., v. London Woollen Co., Ltd.

IN the Court of Appeal on January 18th, Lords Justices Bankes, Scrutton and Atkin heard an application by the plaintiffs in this matter for an order requiring the defendants to give security, to the extent of £200, for the costs of an appeal which they had entered from a judgment of Mr. Justice Avory and a special jury in the King's Bench Division on November 12th last (*vide* ELEC. REV., November 20th, p. 840).

For the plaintiffs it was contended that the hearing of the appeal would take some time. The defendants replied that there was only one point in question, and they had offered security of £50.

The Court ordered the defendants to give security in the sum of £75.

Heath Pritchard, Ltd., v. Schnider.

IN the Bow County Court, on January 15th, before Judge Snagge, Messrs. Heath Pritchard, Ltd., electrical and general engineers, Canning Town, E., sued Mr. Schnider, a tailor and outfitter, of Victoria Dock Road, E., to recover £5 2s. 6d. for electrical work done at the defendant's shop.

The plaintiffs' representative said that it was agreed to carry out the work for £3 5s., but when the Council's official inspected the work, he found fault with the connections, which had nothing whatever to do with them, and alterations had to be carried out, which ran up the cost. The defendant suggested that these alterations had nothing to do with him, but the plaintiffs' representative said that they were bound by the Council, and the consumer had to pay.

Judge Snagge gave judgment for the plaintiff for £5 2s. 6d. and costs.

Attorney-General (St. Pancras Corporation) v. County of London E.S. Co., Ltd.

THE Corporation of St. Pancras, through the Attorney-General, brought an action in the Chancery Division on January 13th, claiming an injunction restraining the County of London Electric Supply Co., Ltd., from supplying electrical energy outside its area, and within the area of the Corporation, *viz.*, to the property belonging to E. Hulton & Co., Ltd., Gray's Inn Road, W.C.

SIR T. H. HUGHES, K.C., for the plaintiffs, said the object of the action was to restrain the defendant company from acting *ultra vires* by supplying electrical energy outside its area of supply. The plaintiffs were the electricity authority for the borough of St. Pancras, and the defendant company had an area in the borough of Holborn. Hulton's had acquired a large piece of property bordered by Gray's Inn Road, Wilson Street, Gough Street, and Elm Street, and had erected large works for which they required a very large supply of electricity. About 1,000 square yards of Hulton's premises were in the defendant company's area and the remaining 5,000 in the Corporation's area. Hulton's approached the Corporation when their buildings were being put up with regard to a supply of electricity, and after long negotiations they signed an application form in January, 1923. But in the following month they got into communication with the defendant company and negotiated for a competitive supply, and on June 13th, 1923, a contract was entered into with the defendant company. But anticipating that there might be trouble they took an indemnity from the defendant company against any action that might be taken by the St. Pancras Corporation. The whole of Hulton's site was in the borough of St. Pancras, but, as stated, the whole of it was not in the Corporation's area of supply. Hulton's contract with the defendant company provided for a minimum payment of £4,500 a year for electricity for a minimum period of seven years.

Having referred to the various Acts and Orders bearing on the case, Counsel said that the defendant company was supplying energy for the whole of Hulton's premises as constructed and intended to supply it to those premises yet to be built in contravention of the provisions of the Acts and Orders quoted.

His LORDSHIP (Mr. Justice Tomlin) said he understood the question to be whether under these Acts and Orders the supply of energy meant supply to the terminals of the consumers in the manner suggested in the decided cases. If that was so it would seem to be a question of fact as to where the energy was supplied. If it was supplied to terminals within the defendant company's area the next question was whether the consumer was with the knowledge of the defendant company using it for purposes outside the area.

SIR THOMAS HUGHES agreed that these were questions to be dealt with, but he submitted that the supply was being made to the lamp that was burning or to the engine, and not, as in

this case, to the defendant company's sub-station on Hulton's premises in Elm Street.

Evidence was called on both sides, and SIR ARTHUR CLAUSON, K.C., submitted the case for the defence. It was denied that the defendant company was supplying energy beyond its statutory area in contravention of the material Acts and Orders. If Hulton's intended to use energy supplied by the company for one part of their property on another part, the defendants denied that this would constitute a breach of the Acts or Orders. They further denied that the St. Pancras Corporation had been ready and willing to supply energy to Hulton's on reasonable terms. Alternatively it was submitted that if the defendants had committed any breach (which was denied), the Corporation was not entitled to the relief it claimed. Under Section 6 of the County of London (Northern Extension) Electric Lighting Order, 1897, as confirmed by the Electric Light Orders Confirmation Act, 1897, it was indicated that should the defendants supply energy in contravention of Section 5 of the Order, which delimited the defendants' area, the Electricity Commissioners had power to revoke the Order. They contended, therefore, that the Corporation's remedy was by application to the Commissioners, and that that Court had no jurisdiction to grant the relief claimed.

The hearing was adjourned.

Business Notes.

Commercial and Industrial Developments, Business Changes, Trade Opportunities, New Publicity Literature, Liquidations and Failures.

A Swedish Company's Activities.—The Allmänna Svenska Elektriska Aktiebolaget has obtained large orders for electric power stations in New South Wales. The works are at present well occupied with orders from Sweden, Finland and Russia. The negotiations with the Soviet authorities for a concession for the resumption of the company's engineering activity at Jarcslav are expected to terminate within a few days.—*Reuter's Trade Service* (Stockholm).

A Large Stoker Order.—The Riley Stoker Co., Ltd., has received an order for eight Riley "Super" stokers, each to burn up to 10 tons of coal hourly, for eight Babcock boilers, each for 134,000 lb. actual steam hourly, and for 156,000 lb. overload. Four boilers will have water-cooled walls; the other four will have the ordinary straight-wall settings. Each stoker has an undivided furnace, the incandescent surface of the entire fuel bed radiating direct to the boiler tubes which form the roof boundary of the archless furnace. This is a repeat order from a central station already using 13 Riley stokers.

The F.B.I. and Inter-Imperial Trade.—The Federation of British Industries has addressed to the Prime Minister a letter dealing with the importance of the Empire markets as consumers of British manufactured goods, and urging the necessity for encouraging this trade in every possible way. It is pointed out that in 1924 the value of United Kingdom exports to various parts of the Empire were valued at £337,000,000, and represented 41 per cent. of the total export trade of this country. The need for an increase in our total export trade is evident, and is the true solution of our unemployment problem. The expansion of our exports to the Empire depends upon the purchasing power of the Dominions, and the greater the volume of Dominion products bought by us the greater is the possibility of the purchase by the Dominions of British manufactured goods. The letter concludes by expressing the opinion that the reports issued last year by the Imperial Economic Committee deal with some of the most pressing problems confronting the Empire to-day, and the Prime Minister is asked whether the Government intends to issue a statement with regard to the action which it is proposed to take on these reports.

Paraguayan Electrical Imports.—A report upon Paraguay by Mr. F. W. Paris, British Chargé d'Affaires at Asuncion (Stationery Office, 1s. net), includes some details of the country's electrical imports. The total value of these in 1924 was £18,185, as compared with £9,968 in 1923. During the first half of 1925 the value rose to £16,292. The United Kingdom's share in 1924 was valued at £1,665 (£325 in 1923), but there was a fall to £400 during the first half of last year. On the contrary, Argentina's share rose from £1,720 in 1923 and £4,528 in 1924 to £10,075 in the first six months of 1925. The figures for Germany were:—1923, £1,947; 1924, £1,123; and 1925 (six months), £2,603. The equivalent figures for the United States were £460, £1,543, and £4,242.

The British Industries Fair.—Preparations for the forthcoming British Industries Fair, to be held in London and Birmingham from February 15th to 26th, are now well advanced. Nearly 250,000 square feet of space has been booked, a large number of overseas buyers have already intimated their intention of visiting the Fair, and there is little doubt that it will be one of the most successful of the series. To celebrate the opening of the Fair, a banquet will be given by the Government on the opening day. The Prince of Wales will be the principal guest, the Lord Mayor of London is lending the Mansion House for the occasion, and Sir P. Cunliffe-Lister, M.P., President of the Board of Trade, has promised to preside. The annual banquet of the Birmingham Chamber of Commerce has been fixed to take place during the first week of the Fair. Advantage is being taken of the presence in the City of a large number of prominent overseas and home buyers, and many of these will be invited to the function.

Irish Free State Electrical Imports.—The official returns show that the imports of electrical goods into the Irish Free State during October last attained a value of £58,983, as compared with £38,495 in the corresponding month of 1924. The aggregate imports for the first ten months of the past year are returned at £308,015, as against £329,269 in the similar period of 1924. It should be noted that the foregoing figures do not include electrical machinery.

The Eight-hour Day in Sweden.—The Government proposes that the present law relating to the eight-hour day, which is to remain in force until the end of 1926, shall be rendered definitely valid after that date with certain changes in order to bring the law into conformity with the Washington convention and prevent the abuse of concessions granted by the present law.—*Reuter's Trade Service* (Stockholm).

Glass-makers and Protection.—Representatives of employers and workmen concerned in the glass industry met in national conference at Birmingham on January 13th to consider the question of initiating a new movement for securing recognition of the claims of the industry to protection against foreign competition. The bodies represented were the British Flint Glass Manufacturers' Association, the Northern Association of Pressed Glass Manufacturers, the National Flint Glass Makers' Society, and the Pressed Glass Makers' Society. Mr. William Stuart, of Stourbridge, presided. The view was expressed that the application previously made could only have been rejected through inappreciation of the situation of the industry, and its importance from a national standpoint was shown during the war. It was recalled that the Controller of Glassware made a record that the production of chemical, medical, surgical, and other scientific glass-ware, bulbs and tubing for electric lamps, and glasses for miners' lamps, assisted very materially in the successful prosecution of the war. A resolution was passed in favour of steps being taken to promote a further application to the Government.

Lead.—In their report for January 16th, Messrs. James Forster & Co. say:—"The Board of Trade returns, as below, give the December imports as 30,132 tons, which constitutes a record for arrivals during any one month, and up to the 13th of this month about 15,000 tons have been imported. In addition to all this lead, it is estimated that there are probably 5,000 tons in warehouse. In face of the foregoing, and with the present consumptive demand, the price of £35 per ton for lead seems to us to be quite high enough. The Board of Trade returns for December were:—Imports, 30,132 tons; exports, 3,174 tons; leaving for home consumption, 26,958 tons."

The A.E.U. and the Industrial Alliance.—Ballot papers have been issued to its members by the Amalgamated Engineering Union asking them to vote for or against the proposal to affiliate with the Industrial Alliance. The Alliance at present embodies the miners', railwaymen's, transport workers', iron and steel workers' and other trade unions, which have undertaken to afford one another financial or active support in industrial disputes.

Exports of British Machinery.—Commenting on the Board of Trade Returns issued last week, the British Engineers' Association points out that some of the most satisfactory figures are those relating to the exports of machinery, motor cars, locomotives and electrical apparatus. The total of exports of machinery for December, 47,744 tons, is not only the highest monthly total recorded this year, it is higher than that of any month during the past three years. The total exports of machinery for the year 1925 amount to 515,896 tons, the highest figure for any year since 1913. The steady tendency to improvement recently reported by the Association is generally confirmed by these statistics. It should not be forgotten, however, that the total export tonnage of machinery still represents only 75 per cent. of the pre-war average, and that there is still considerable leeway to be made up, but given favourable conditions, and no acute labour disturbances, it may reasonably be anticipated that the results for the ensuing year will show further and progressive improvement.

Venezuelan Contract for a British Company.—It is announced that MESSRS. MELDRUMS, LTD., have been awarded a contract for a complete refuse destructor installation for the city of Caracas. The plant will have a capacity for dealing with 100 tons of refuse per day and will provide steam for the generation of electrical energy.

Belgian Cable Orders for Germany.—The *Financial Times* reports that the orders for large quantities of telephone cable recently given by the Belgian Government have been placed partly with the Felten and Guilleaume Company and to a large extent with the Allgemeine Elektricitäts Gesellschaft, of Berlin.

Another Western Electric Development.—It is reported that the wholesale electrical supplies business carried on by the Western Electric Co., Inc., has been separated from that company's telephone manufacturing business, and put in charge of a new company known as the "Graybar Electric Company." Our contemporary *Electrical Merchandising* says that this gives a separate identity to the "largest wholesale distributor of electrical apparatus and related equipment in the world." The business was first conducted by a partnership under the names of "Gray & Barton," from which the new name has been derived. The president of the new company is Mr. A. L. Salt, and the chairman of the board of directors is Mr. C. G. Dubois. The capitalisation is $15,000,000, all owned by the Western Electric Co. The company will market a wide variety of appliances which have hitherto been sold under the name of "Western Electric," under the trade name of "Graybar." The range will include generators and motors, cables, telephones, lamps, domestic appliances, and radio apparatus.

Electrical Display at Birmingham.—In connection with the recent Birmingham and Midland Institute conversazione, the Birmingham Electric Supply Committee arranged an "All-electric home" at the Institute. The exhibit comprised a combined lounge and dining room, a part of which is depicted in the left-hand section of the accompanying illustration; a bathroom (centre); a bedroom (right); and a kitchen. The display proved most attractive and interesting, and elicited much favourable comment. In the combined lounge and dining room, the prevailing style of furniture and decorations was that of the Tudor period. It contained a 3-kW "Magicoal" fire, supplemented by a 2-kW portable fire. There were two lighting brackets with 40-W white gasfilled lamps, and a four lamp lantern fitting for the general lighting. A counterweight fitting with three 40-W white gasfilled lamps was fixed over the dining table, and a floor standard and desk lamp were also shown. There was an up-to-date array of small appliances consisting of coffee percolator, table grill, toaster, kettle, hotplate, iron, vacuum cleaner and fan, also the ubiquitous loud speaker. The bedroom was furnished in mahogany. A two-light rise-and-fall pendant was fixed over the dressing table, a single counterweight light in the centre of the room, and over the cot a single "Osglim" lamp. A tray as set for early morning breakfast, with kettle, toaster and reading lamp, was placed on a table at the side of the bed. The heating was by means of a 2-kW "Arora" fire, with a 600-W bowl fire for occasional use. In the bathroom a geyser was fitted over the lavatory basin, and a 3¼-gal. electric geyser for the bath. It also contained a 2-kW cabin fire fixed to the wall, electric towel and gown rails, and a shaving mirror with a spot light. A totally-enclosed bowl fitting was installed for lighting. In the kitchen the apparatus consisted of an "All-British" washing machine, an automatically regulated refrigerator with compartments for freezing and cooling, one of the latest pattern 6-kW type cookers as supplied on hire by the Birmingham Electric Supply Department, and a 2-kW fire for general warming purposes. A totally enclosed ceiling lighting unit, with special adaptor for use with occasional appliances, irons, kettles, &c., was fixed in the centre of the room.

An "All-Electric Home" at Birmingham.

The "Americanisation" of Canada.—The penetration of American goods and ideas into Canada has been increasing at a rapid rate during the past few years. According to the Toronto *Electrical News*, this is not viewed without alarm in certain circles. Recently at an annual meeting of chambers of trade and commerce in Ontario, a resolution was passed urging the Dominion Government to place an import duty on American magazines entering Canada (of which there are said to be 150), as these consist largely of advertising matter. The latter, when it enters undisguised, is subject to a duty of 15 cents per pound.

Swedish Telephone and Telegraph Exports.—According to the *Swedish Economic Review* (the journal of the Swedish Board of Trade) the exports of telephone and telegraph apparatus during the period January—November, 1925, were valued at 6,476,000 kr., as compared with 6,778,000 kr. in the equivalent period of 1924.

Chinese Notes.—The Honan authorities have recently ordered five small radio plants from the Siemens (China) Co.

The whole of the property of the Kiangwan Electric Co. (Shanghai) has been acquired by the Chapei Electricity and Waterworks Co.

Lead Prices.—We have received from Messrs. M. H. Cawson & Co. a chart showing the prices of soft foreign pig lead for each month from 1913 to 1925 inclusive. Statistics of imports and consumption for each year are also given.

The Timber Trade.—Our Timber Trade correspondent reports that the demand for soft woods for general requirements is increasing in volume, which is assisting the rather large stocks on the London and provincial markets. Prices of late months have been on a very cheap level, considering costs of production, and the year 1925 has been an unremunerative one to the trade, and especially to the foreign exporters. The latter, however, are now attempting to raise values for shipments to come forward this season, and although these values will be on a slightly higher level, compared with 1925 closing rates, they will be lower than prices ruling a year ago. In the hardwood section of the trade, prices for all descriptions are firm, and this is especially so of teak, which is used in the electrical trades for various purposes. Mahogany is also a firm market, and those choice timbers described as "fancy woods" continue to be strong in value.

A Visit to Germany.—The *Birmingham Post* reports an address by Mr. Wilfrid Hill to the members of the Council of the Birmingham Chamber of Commerce upon the economic position of Germany. Mr. Hill, who has paid a series of visits to that country, said that Germany's national wealth had shrunk, and that had caused a scarcity of money which was holding up trade. The payment of reparations was being made by means of money borrowed at high interest, and Germany could only repay this by exporting goods. Export trading was rendered difficult by the tariff walls which had been raised against German goods. This was a problem which affected not only Germany, but, more or less, every other European country, and might possibly result in a European Zollverein, a project which was under consideration at the present time. It was not true that German competition was more aggressive than before the war in all branches. The plant, machinery, skill and determination were there, but the motive power of adequate money was lacking. At the recent Berlin motor, motor-cycle and cycle show it was admitted that German productions were badly beaten, both in price and quality, by British products, and that was the case in many trades. German banks were charging from 10 to 14 per cent. for accommodation. Wages, however, had not increased to the same extent as British wages, but the demand for increases was persistent. Taxation was at nearly three times the pre-war level, representing 46 per cent. of the German people's income, as compared with 18.6 per cent. in our own case. Other handicaps were the eight-hour day, and higher freight charges. Mr. Hill said that for the next two years he failed to see Germany as an effective competitor in the world's markets, and "it was now the psychological moment for those who had complained so bitterly of German competition in the past to thoroughly realise the situation, and so take steps not only to regain that which was lost, but even to sell goods in the German home market, which in many trades was actually possible to-day."

Foreign Glassware.—At a meeting of the Weymouth Town Council, last week, a protest was offered against the acceptance of the tender of a foreign firm for globes for the public electric lamps. The borough electrical engineer said that no British firm could make the globes. Another speaker said that the globes were made in Czecho-Slovakia. The tender was accepted.

Industrial Court President Resigning.—It is reported that Sir William Mackenzie, K.B.E., K.C., is shortly resigning the post of President of the Industrial Court, which he has held since the establishment of the Court in 1919. The Minister of Labour has appointed Mr. Harold Spencer Morris, K.C., to succeed him as President. Mr. Morris was appointed last year to be Chairman of the Railway Wages Board in succession to Sir William Mackenzie.

Unemployment.—No unemployment figures were issued for the week ended December 28th, but during the subsequent week the number of unemployed registered was 1,251,900, an increase of 149,500 during the fortnight. There was, however, a decrease of 30,306 in the subsequent week.

A Unique "Dividend."—*Electrical Merchandising* reports that the Hartford Electric Light Co. stated in a recent note to its consumers that as its working expenses had been abnormally low, and the earnings were about 5 per cent. more than required for interest, dividends, and a moderate surplus for the year, each customer would receive a "dividend" in the form of a 50 per cent. discount on his October bill.

Trade Announcements.—MR. FREDK. J. GORDON, formerly a sales director with Fuller's United Electric Works, Ltd., is now established as a manufacturers' representative at 91, Moorgate Street, London, E.C.2. He has just taken over the London agency for the Clayton Rubber Co., Ltd., of Manchester, and is open to take up another in addition.

MESSRS. SPRECHER & SCHUH CO., Aarau, Switzerland, announce that, in order to meet the increasing demand for their switchgear, "and to comply with the justifiable desire of customers that it should be of British manufacture," they have made arrangements with Messrs. Isenthal & Co., Ltd., to manufacture it on their behalf and to their designs at their Denzil Works, Willesden, N.W.10. Communications should be addressed to Mr. J. B. Rudkin, the company's representative, at the London office, Albion House, 59, New Oxford Street, W.C.1.

MESSRS. G. F. CLARK & PARTNERS, consulting engineers, of Parliament Mansions, S.W., have removed to 7, Victoria Street, S.W.1.

Catalogues and Lists.—THE IGRANIC ELECTRIC CO., LTD., Elstow Road, Bedford.—A number of publications dealing with "Igranic" and "Igranic-Pacent" radio apparatus, as condensers, filament resistances, transformers, &c., and complete supersonic heterodyne receiving outfits.

THE CHLORIDE ELECTRICAL STORAGE CO., LTD., Clifton Junction, near Manchester.—Leaflet 4045, describing methods and apparatus for testing portable accumulator batteries.

MESSRS. CHARLESWORTH, PEEBLES & CO., 5, Eden Street, Hampstead Road, N.W.1.—A leaflet and price list advertising the "Quickfix" electric light gallery.

THE BRITISH THOMSON-HOUSTON CO., LTD., Mazda House, Newman Street, Oxford Street, W.1.—A folder illustrating the illumination of a number of cathedrals and churches; and a pamphlet giving illustrations and prices of "Luxor" lighting fittings.

THE GENERAL ELECTRIC CO., LTD., Magnet House, Kingsway, W.C.2.—A mailing card advertising "G.E.C." Home Office fuse boards.

SWITCHGEAR & COWANS, LTD., Elsinore Road, Old Trafford, Manchester.—A set of scales from ⅛ in. to 3 in. = 1 ft. Much useful information is given on the scale backs including conversion tables, and British standard tables for bare copper conductors and wire gauges.

SMITH & ANSELL, LTD., Stockfield Road, Acocks Green, Birmingham.—Illustrated pamphlet describing a new series of lighting fittings known as "Cylinder Units."

SIEMENS & ENGLISH ELECTRIC LAMP CO., LTD., 38-39, Upper Thames Street, E.C.4.—January price sheet of electrical materials, appliances and accessories.

MESSRS. DONOVAN & CO., 47, Cornwall Street, Birmingham.—An illustrated booklet dealing with industrial panels made by combining "Safuse" and "Donlok" switch and fuse gear with busbar chambers.

ATELIERS DE CONSTRUCTIONS ELECTRIQUES DE CHARLEROI, 56, Victoria Street, S.W.1.—January stock list of motors and dynamos.

MESSRS. J. MCMILLAN & CO., 17, Surrey Street, Strand, W.C.2.—A price list of telephone condensers of from .005 to 4 mfd. capacity.

THE WESTINGHOUSE ELECTRIC & MANUFACTURING CO., East Pittsburgh, U.S.A.—Illustrated pamphlets dealing with induction frequency changers, self-propelled 'buses, and the "Inertaire" transformer.

MESSRS. FERRANTI, LTD., Hollinwood, Lancashire.—Pamphlet Ta.746, illustrating and describing the "Ferranti" surge absorber.

ORION LAMPS, LTD., 15, Eldon Street, London, E.C.2.—Price list of "Orion" gas-filled and vacuum lamps.

MESSRS. COLEY & SWINNERTON, LTD., St. John's Square, Wolverhampton.—Three illustrated and priced pamphlets, dealing respectively with the "Electric Perfection" oven, the "Savex" cooker, and the "Savex" wash boiler.

MESSRS. E. P. ALLAM & CO., 107-109, Gray's Inn Road, W.C.1.—Monthly stock list of d.c. motors, &c., for sale or hire.

Bankruptcy Proceedings.—H. L. WOOD, 7, Taswell Road, Southsea, Hants., electrical engineer and wireless dealer.—The first meeting of creditors was held on January 18th at the Official Receiver's offices, Portsmouth. The statement of affairs showed liabilities of £4,069, while the net assets were estimated at £85, leaving a deficiency of £3,984. Debtor attributed his failure to liability under judgment given against him in an action brought by his late partner. It appeared that in December, 1918, with about £500 capital, he commenced business at High Street, Clapham, as an electrical engineer. The business was apparently a success, and debtor alleged that in August, 1920, he sold it for £1,500, at which date he owed nothing. He then took premises at 2, Palmerston Arcade, Portsmouth, and commenced a new business as an electrical engineer with £1,500 capital. In March, 1921, he was joined in partnership by another who paid £2,000 for a half share in the business. In the following month the partnership purchased an additional small business and traded at those premises and at Palmerston Arcade as electrical engineers and, subsequently, as dealers in wireless sets. The business was not successful, and in May, 1923, a deed of dissolution was executed and a receiver appointed. A claim was made against debtor for £1,717, and judgment was given against him for the full amount claimed with costs. After the dissolution of the partnership, debtor stated, he entered into a partnership with his wife. The business was successful, and in March, 1924, he instructed a firm of solicitors in London to register a limited company for the purpose of acquiring the business. Fees and costs were paid to the solicitors to the extent of about £400, but the matter was never completed. Subsequently further steps were taken and on November 17th last a company was registered with a nominal capital of £500. An agreement was entered into under which the company purchased the assets of the business for £1,998 and undertook to discharge outstanding liabilities to the extent of £300. The purchase price was to be paid by the allotment of 498 £1 fully paid up shares to the debtor and his wife, and £1,500 debentures issued to debtor's wife. No actual cash was found. Debtor did not admit that he was aware of his position until the judgment was obtained against him by his late partner, and finding it impossible to meet this liability he decided to file his petition. The case being a summary one was left with the Official Receiver as trustee of the estate. The following are creditors:—

	£		£
David, G. J.	105	Michaelsen, R.	254
Jay Bros.	30	Stanton, H. G.	1,916
Lister, Miss E. J.	900	Torr & Co.	200

T. W. CRAWFORD, dealer in electric lamps, 25, Highbury Hill, N.—This debtor failed in August last with liabilities of £792 against assets of £19, and on January 13th he attended for public examination before Mr. Registrar Coldridge, at the London Bankruptcy Court. Replying to Mr. Waterer, Official Receiver, the debtor stated that in December, 1923, he commenced business at 41, Cheapside, E.C., as a general merchant, dealing mostly in foreign electric lamps, and trading, from March, 1924, under the style of "The Despina Co." The business was fairly successful, but upon an injunction being obtained against him in June, 1924, restraining him from infringing the patents of an English company, he closed the business. During the previous April he had opened under management, a similar business at 25, Lord Street, Liverpool, under the same trading name; that business was badly managed, and was closed in October, 1924. Another business was opened by him in September, 1924, at 32, Victoria Street, S.W., under the style of "T. Wheatley & Co."; owing to lack of capital, and also mismanagement during his absence through illness, that business was not successful, and was abandoned in April, 1925, on the landlord distraining for rent. The examination was concluded.

H. HALL, wireless dealer, 26, Egerton Street, late of 6, Market Place, and Albert Chambers, Blackburn Street, Radcliffe, Lancashire.—Receiving order made January 7th, on debtor's own petition.

G. BONNET, electrical contractor and general engineer, 2a, Camden Road, N.—Receiving order made January 12th, on creditor's petition. First meeting, January 26th. Public examination, March 17th, both at Carey Street, W.C.

J. F. CARR, electrical goods agent, 89, Aston Avenue, Fallowfield, Manchester.—Receiving order made January 13th, on creditor's petition.

J. R. BARKER, wireless dealer, Tanshelf House, Front Street, Pontefract, and 183, Kirkgate, Wakefield.—Receiving order made January 11th on debtor's own petition. First meeting, January 25th, at the Official Receiver's office, 21, King Street, Wakefield. Public examination, February 11th, at the Court House, Wakefield.

H. WILSON, electrical contractor and decorator, 56, Woodhall Avenue, and 1,057, Grangefield Avenue, Thornbury, Bradford.—First and final dividend of 3s. 1d. in the £, payable January 22nd, at the Official Receiver's Office, 12, Duke Street, Bradford.

R. L. FOGGIN (Tithebarn Radio Co., Crosby Radio Co., and High Bridge Radio Co.), electrical engineer, "Glen Avon," Fir Road, Waterloo, 63, Tithebarn Street, and 75, Crosby Road North, Liverpool, and High Bridge, Newcastle-on-Tyne.—First and final dividend of 10d. in the £, payable at the offices of the Official Receiver, 11, Dale Street, Liverpool.

T. F. FINUCANE, lecturer in wireless telegraphy, 10, Sunny Gardens, Hendon.—Trustee, Mr. T. Gourlay, Official Receiver, 29, Russell Square, W.C., released January 8th.

A. E. MARTIN, electrical engineer, 104, Oldham Road, Manchester.—Trustee, Mr. J. G. Gibson, Official Receiver, released January 7th.

A. MEADOWS, electrician, The Arcade, Penzance.—Trustee, Mr. G. C. Hancock, Official Receiver, 12, Princes Street, Truro, released January 8th.

W. M. HORSFALL, electrical engineer, 7, Redcross Street, Liverpool.—Last day for proofs for dividend, January 30th. Trustee, Mr. E. W. Davies, 11, Dale Street, Liverpool.

S. H. BARDWELL (Bennett, Bardwell & Co.), electrical engineer, 22, Church Street, Basingstoke.—Last day for proofs for dividend, January 30th. Trustee, Mr. H. Ashton, Official Receiver, Midland Bank Chambers, High Street, Southampton.

F. A. FRASER, electrical engineer, Sanctuary House, 33, Tothill Street, S.W.—Bankrupt's discharge suspended for two years, until December 16th, 1927.

A. A. WATMOUGH, electrical engineer, lately carrying on business with W. Hurworth at 41, Town Street, Horsforth, and 1, Back Street, Harrogate.—Immediate discharge granted subject to consenting to judgment for £50 to be paid within one calendar month.

E. W. ADAMS, lately carrying on business as the Wireless Accessories Stores, 664, Old Kent Road, S.E.—Trustee, Mr. W. J. H. Boyle, Senior Official Receiver, Carey Street, W.C., released January 5th.

R. EMMETT (Emmett & Co.), builder, gas and electrical engineer, 249, Goldhawk Road, Shepherd's Bush, W.—Trustee, Mr. W. J. H. Boyle, Senior Official Receiver, released January 5th.

Company Liquidations.—ARTHUR LANGHAM & SONS, LTD., Holborn Viaduct House, E.C.—The report of Mr. J. Barwick Thompson, Official Receiver and Liquidator, upon the failure of this company, has been issued to the creditors and shareholders. The accounts filed under the liquidation show liabilities of £10,730 against assets of £91, and a deficiency of £10,642 with regard to shareholders, the issued capital being four ordinary shares of £1 each. The company was registered as a private company on December 28th, 1923, with a nominal capital of £10,000, to carry on business as general merchants, importers of articles of Continental manufacture, and exporters of British goods. No established business was acquired by the company, but the original object was to deal in electrical goods, household utensils, and wireless components. Continental purchases were negotiated by Mr. C. A. P. Langham, the late managing director, amounting to approximately £30,000. In May, 1924, the company made arrangements for the purchase of 10,000 wireless headphones to be delivered in fortnightly consignments. The total purchase price was £4,375, and 14 bills of exchange were accepted by the company in respect thereof. No goods were ever received, and it was ascertained that the manufacturers had gone into bankruptcy and could not execute the order. The company thereupon demanded the return of the bills, but without success. It appears that the bills have been sent to the Continent and negotiated there. Some of them have been presented to the bank by third parties who are apparently holders for value. The circumstances in which these bills have been negotiated require further investigation. The failure of the company is attributed by the directors to the inability to obtain delivery of goods from the Continent. A contributory cause was insufficient working capital, and also the bill transaction referred to. In the opinion of the Official Receiver the failure is due to lack of proper business methods, extravagant expenditure and mismanagement.

HALL & BRENARD, LTD., manufacturing radio engineers, Terminal Aerodrome, Croydon.—A meeting of creditors was held on January 11th. The chair was occupied by Mr. A. A. Baster, I.A., Croydon, who had been appointed to act as liquidator in the voluntary liquidation of the company. The statement of affairs presented showed liabilities of £3,613 and net assets of £491, leaving a deficiency of £3,122. Mr. Baster reported that the company was registered in 1923 when it acquired a concern which had previously conducted a mail order business. It had only been a small business, and the issued capital was £702. During the year to May 1st, 1924, the company made a net profit of £362. No accounts had been prepared since May, 1924. In May of last year the company was in difficulties, and in the following July a meeting of the creditors was called. It was then suggested that the creditors should agree to a scheme under which they would be issued debentures in respect of their claims. The scheme was not finally completed until December, and by that time the directors came to the conclusion that they could not carry on the business any longer, and voluntary liquidation took place. Since May, 1924, the company had suffered severely through bad debts, the total being between £900 and £1,000. He did not anticipate that the creditors would receive more than 2s. in the £. The result of the liquidation depended very largely upon the amount obtained for the machinery. The Air Council was in possession, and the assets were being disposed of. Mr. W. Baker, of the Wholesale Traders' Association, pointed out that the distraint took place after the company had gone into liquidation, and he thought the landlords should withdraw. A director of the company said that the normal turnover had been something like £2,000 a month, and it was anticipated that that would be continued. Towards the end of last year, however, the sales fell to £300 or £400 a month. The company had an enormous amount of partly manufactured stock, but it could not be realised to advantage unless the goods were completed. A resolution was passed to the effect that the voluntary liquidation of the company should not be confirmed. The following are creditors:—

	£		£
Aluminium Corporation, Ltd.	246	Hughes, F. A., & Co., Ltd.	91
American Hard Rubber Co.	21	Hampton Works Co.	42

L. WEEKES, LTD., electrical engineers, Langley Street, Luton.—A meeting of creditors was held on January 14th, at the offices of Messrs. Crew, Turnbull & Co., C.A., Luton. The chair was taken by Mr. B. T. Crew, the liquidator appointed by the shareholders. A statement of affairs prepared as at December 1st, 1925, disclosed liabilities of £4,262, there being, in addition, debentures and accrued interest of £2,857, and preferential claims and receiver's liabilities were set down at £981. The net available assets amounted to £840, leaving a deficiency of £3,421. There were also questionable assets totalling £2,848, but they were not included in the statement of affairs. The company was incorporated in June, 1916, for the purpose of acquiring the business of Mr. L. Weekes, who was identified with the British Electric Calibrated Fuse Co., and was also interested in a concern called the Safetee Controlling Appliance Co. In August, 1924, the bankers, who held the debentures, instructed Mr. Crew to make an independent report as to the position, and this was done. Mr. Crew said he was then of the opinion that an opportunity should be given to Mr. Weekes to introduce new capital into the concern, and that it would be unwise to close the business forthwith. The trading, therefore, was continued for over twelve months, but in August, 1925, creditors began to press and writs were issued. Mr. Crew was appointed receiver, and received an offer for the whole of the undertaking from Mr. Dryden. This was accepted, the larger creditors being called together and informed of what was proposed. There was a probability of a dividend of between 3s. and 4s. in the £. A creditor remarked that in a period of six years something like £15,400 had been drawn as directors' remuneration. It was decided that Mr. Crew should be confirmed as liquidator of the company. The following are creditors:—

	£		£
Baltic Scandinavian Co. (Copenhagen)	60	Grey & Marten, Ltd.	68
Bengal Foundry Co.	180	Hoare & Bellamy	34

Godden & Rudd	32	Wilson, C., & Sons	21

ELECTROZONE CO., LTD.—Winding up voluntarily. Liquidator, Mr. F. J. H. Boultbee. A meeting of creditors was called for January 18th at the offices of Messrs. Desmond, Page and Adams, 13, Victoria Street, S.W.

ERITH ELECTRICAL CO., LTD.—A petition for the winding up of this company has been presented on behalf of the E.S. Co., Ltd. (in voluntary liquidation), creditors, by the liquidator, Mr. B. A. Smith, and will be heard at the Court House, Eastgate, Rochester, on February 10th.

GAS & ELECTRIC SECURITIES, LTD.—First meetings of creditors and contributories, January 26th, at Carey Street, W.C.

New French Companies.—Among the new hydro-electric undertakings recently organised in France are the Société des Forces Motrices du Bearn (63, Avenue des Champs Elysées), with a capital of 10 million francs, and the Syndicat pour l'Etude des Chutes d'Eau du Bassin du Lot (54, Rue de la Boetie, Paris), capital 150,000 fr. La Société des Etablissements G. Oyer & Cie. La Radiotéléphonie Française is the name of a new company which has lately been formed in Paris (11, Rue du Rhin), with a capital of 700,000 fr., to acquire and develop a radio apparatus manufacturing business.

An American View.—In an article on "British Electric Power Developments," *Commerce Reports* says:—"Among the influences restricting the sale of American household labour-saving devices has been the high cost of electricity and the utter lack of uniformity in current supply. The present policy of large interconnected generating stations, resulting in lowered production costs, should gradually bring about the removal of this handicap."

Japanese Electrical Companies Prospering.—Reporting upon conditions towards the close of last year, the United States Commercial Attaché in Tokio stated that electrical power companies were prosperous and had declared good dividends from earnings. The sales of electrical equipment during November were quiet, but some large equipment business was in prospect. The indications were that there was eliminative competition going on among domestic manufacturers of smaller electrical equipment.

New Zealand Preference Regulations.—The revised regulations made by the Government of New Zealand with regard to the admission of British or partly-British goods at preferential rates are reproduced at length in the *Board of Trade Journal*, dated January 14th. Full particulars are given of the certificates required and the method of preparing invoices, &c.

The Contractors' Dinner.—The annual dinner of the Electrical Contractors' Association was held at the Trocadero, Piccadilly, W., on Tuesday last. A report of the proceedings will appear in our next issue.

Book Notices.—"Official South African Municipal Year Book, 1925-1926." Edited by W. P. M. Henderson and Francis G. Pau. Capetown: Francis G. Pau; London agents, Edw. G. Allen & Son, Ltd.—Contains particulars of the South African Municipalities, sectionalised both with regard to the Provinces and the various municipal concerns. A section on the electrical undertakings gives full details of the generating plants, distribution systems, tariffs, &c., for each electrical supply department. These particulars, besides being given under separate headings for each municipal undertaking, are dealt with in prepared tables under the above headings.

"Engines of High Output." By Harry R. Ricardo, B.A. P. viii + 110; figs. 38. London: Macdonald & Evans. Price, 7s. 6d. net.—This book is a treatise on the possibilities and limitations of high-speed internal-combustion engines, dealing in particular with the thermo-dynamic side of the subject. The author has avoided to a large extent the use of mathematical calculations and formulæ, although he has supported many of his views by curves and simple arithmetic.

"Marconiphone Log Book."—As its name indicates, this little pocket booklet is ruled for entering the essential particulars of radio stations heard. The valve notes and tables enable data to be ascertained quickly, not only for individual valves, but also for complete sets; a large number of arrangements of valves suitable for different types of sets have also been tabulated. The booklet is obtainable from the Marconiphone Co., Ltd.

"Vibrations in Engines and Machinery." By A. T. J. Kersey, A.R.C.Sc. "The Elements of Reinforced Concrete Design." By H. V. Crabtree. Publications of the Association of Engineering and Shipbuilding Draughtsmen. Price 2s. each.

"Quarterly Bulletin of the British Cast Iron Research Association." No. 11. January, 1926.

"Report on the Economic Conditions in Venezuela, September, 1925." By H. A. Hobson, H.M. Consul, Caracas. London: H.M. Stationery Office. Price 1s. net.

"The Story of Mathematics," by D. Larrett. Pp. 88. London: Ernest Benn, Ltd. Price, 2s. 6d. limp cloth, 3s. 6d. stiff cloth.

"The Post Office Electrical Engineers' Journal." Vol. XVIII, Part 4, January, 1926. London: Electrical Review, Ltd. Price 2s.

"National Economics for Britain's Day of Need," by E. Batten. Pp. xi + 217. London: Sir Isaac Pitman & Sons. Price, 5s. net.

"The *Transactions* of the South African Institute of Electrical Engineers," Vol. XVI, Part 10; November, 1925. Price, 2s.

"Turbo-Blowers and Compressors," by W. J. Kearton. Pp. xi + 333; figs. 153. London: Sir Isaac Pitman & Sons, Ltd. Price, 21s. net.

"The *Journal* of the Institution of Electrical Engineers." Vol. 64. No. 349. January, 1926. London: E. & F. N. Spon, Ltd. Price 10s. 6d.

The Egyptian Electrical Market. — In the course of a recent article upon this subject *Commerce Reports* states that the abundance of cheap labour in Egypt has restricted the development of the market for domestic electrical appliances. Electric fans have attained a large measure of popularity, and, in spite of their higher cost, British and American fans are becoming in greater demand owing to their superior quality. Ceiling fans are extensively used in large buildings, but the possible market for small exhaust fans for offices, shops and public halls has never received the serious attention of local dealers. There is but little demand for vacuum cleaners, although a few hand-operated German machines are on the market. The low charges of hand laundries have excluded electric washing machines, but a good demand exists for electric irons, and the Germans supply the bulk of these at present. Electric kettles are sold in small numbers, and hotplates have a small but growing market. One article for which there are opportunities is the electric refrigerator, although it is handicapped by the high charges for electricity; it is thought that the demand for refrigerators is likely to grow considerably. As most Egyptian houses have no heating arrangements, electric heaters find a considerable market in the cool season. The bulk of these are of the "headlight" type (bowl fires), and of German, Italian, and French makes. At Alexandria, Cairo, and Port Said dealers in electrical appliances generally buy direct from foreign manufacturers, or, in a few cases are given consigned stocks by German manufacturers. As a general rule, electrical appliance dealers stipulate that exclusive representation shall be given for Egypt, the Sudan, Palestine, and, in a few cases, Syria. Although this is not always satisfactory it is believed that, with increasing purchasing power and lower rates, the most important dealers can adequately handle this wide territory, as the countries are closely related through customs, language, and transportation.

Doncaster and Electrical Contractors.—The Doncaster Corporation, replying to protests by local electrical contractors and the Chamber of Trade against the proposed municipal sale of electrical appliances and fittings, states that no such sale is intended unless the contractors charge unreasonable prices.

The W.R.A. and Trade Organisation.—We are requested to give publicity to the following:—"In the present crisis in the organisation of the industry, the Wireless Retailers' Association feels that a statement of its views on certain important matters, which not only relate to the organisation of the trade as a whole, but which directly concern dealers, may be helpful in clarifying the general position and in defining issues.

"The first is that the consensus of opinion amongst retailers is that their interests should be represented by an independent Association of their own. This fact has been ascertained beyond question by voluntary statements, exhaustive inquiries and the issue of a questionnaire on the subject, in the course of which practically no dissentients from this view were encountered.

"It will be generally admitted that in the present stage of evolution of the industry the problems confronting each section are more than sufficient to tax the whole attention, energies and resources of any body representing it, without attempting to encroach on other interests. In these circumstances, it is submitted that the only logical course is for each section to devote its entire efforts to the organisation of its own constituents.

"The second is that a far closer co-operation between the manufacturing and retailing sections of the industry than has hitherto obtained is imperative; but this can only be really effective when each section is thoroughly organised.

"The W.R.A. has never ceased to proclaim its desire for active co-operation, and any scheme for the organisation of the manufacturers' section of the industry which embodies the principles outlined, can be assured of receiving the unqualified moral and active sympathy of this Association.

"The third point is that there should be no control of discounts, and that preferential treatment should be excluded.

"The Executive of the Wireless Retailers' Association is assured that the recognition of these principles is vital to the success of any scheme for reorganisation which the manufacturers may have under contemplation, and urges those with the welfare of the industry at heart to use all their influence to secure their adoption, believing that it is only in this way that the trade can be organised on a sound, equitable and permanent basis."

For Sale.—By direction of Messrs. C. J. Thursfield and Co., Ltd., manufacturers of electrical fittings, Birmingham, who are rearranging their works, Messrs. E. L. Stevens and Champion will sell by auction on January 28th, at Cecil Works, 42, Clement Street Parade, Birmingham, a stock of high-class new electrical fittings, &c. Mr. H. J. Shaw will sell by auction at 13, High Holborn, W.C., on February 3rd, a manufacturer's stock of wireless goods and materials. (See our advertisement pages to-day.)

Social Events.—A New Year's party and dance was recently given by Mr. Arthur Cozens, of Ascot, Camberley and Clacton, to his staff and friends, about 200 being present.

The annual dinner of the staff and friends of Messrs. Ernest F. Moy, Ltd., took place at the Britannia Hotel, Camden Town, on January 16th. After dinner and the loyal toast, Mr. W. B. Dykes proposed the health of the company and Mr. E. F. Moy responded. The visitors' toast was proposed by Major C. G. Fox and replied to by the Mayor of St. Pancras (Ald. Dr. E. A. Gregg, J.P.).

The annual fancy dress carnival and dance of Messrs. Johnson & Phillips, Ltd., was held on January 8th in the Woolwich Town Hall, and there was a good attendance of members of the staff and their friends. The prizes were the gift of the company's Australian branch manager, Mr. E. A. Kinsley, who was unavoidably absent. The costume which won one of the prizes was that worn by Mr. H. D. Parsons, of the publicity department, representing "One of the J. & P. Pages"—a familiar feature of the advertisement section of the Electrical Review. The prizes were presented to the winners, on behalf of the donor, by Mrs. J. Macgregor and Mrs. C. Stewart.

Calendar.—A calendar sent us by Mr. W. H. Squire, 31, Sweyne Avenue, Southend-on-Sea, depicts a young lady with a bunch of violets. Monthly date slips are provided.

Lighting and Power Notes.

Ashby-de-la-Zouch.—Street Lighting.—The Urban District Council is to convert the street lamps in its area from gas to electric lighting at a cost of £340 per annum for the first five years, and £313 during the next five years.

Ashton-in-Makerfield.—Loan.—The Urban District Council has applied for sanction to a loan of £8,480 for electricity purposes.

Ayr.—Electricity Supply.—The engineer and general manager of the Ayrshire Electricity Board has recommended various improvements, including new sub-stations and transformers, at a cost of £25,000, and the Board has agreed to carry out the scheme. New distributor cables to replace the existing ones are to be laid where the cables are found to be in a bad condition.

Bangor.—NEW ELECTRICITY CHARGE.—The Electricity Committee has decided that electricity consumers of not less than 3,000 kW per annum shall be offered the following tariff as an alternative to the present rate of 8d. per kWh for the first 1,000 kWh per quarter and 7d. per kWh for the next 500 kWh, &c. :—For electricity used for lighting between four p.m. and eight p.m., 9d. per kWh. For electricity used between eight p.m. and 4 p.m. next day, 4d. per kWh, provided that not less than 2,000 kWh per annum shall be used during the hours from four p.m. to eight p.m.

Barnes.—PRICE REDUCTIONS.—The Urban District Council has approved the following revised charges for electricity as from the meter readings in March next :—Private lighting : 4d. per kWh. Lighting, heating and cooking (domestic purposes) : 10 per cent. per annum of the rateable value of premises, plus 1d. per kWh during the winter quarters, and ½d. per kWh during the summer quarters. Power (other than contract), heating and cooking : 2d. per kWh, with discounts up to 37½ per cent. Public lighting : A reduction of £1 per annum for each post in side streets.

Birkenhead. — NEW ELECTRICITY CHARGES. — The Town Council has approved the new scale of electricity charges for domestic purposes, outlined in our issue of January 8th. The new scale will apply only to premises of a minimum rateable value of £18.

Blackburn.—LOANS.—The Town Council has given approval to an application for sanction to the following loans :—Mains, £93,000; services, £45,000; sub-stations, £16,500; change-over of system from d.c. to a.c., £7,500; purchase of showrooms, &c., £14,560.

Bognor.—STREET LIGHTING.—A scheme for lighting the main thoroughfare of the town by electricity is being carried out by Mr. H. A. Harding, electrical engineer to the Bognor Gas-Light & Coke Co. Central suspension lamps of 500 W are being used.

Bradford.—MAINS EXTENSIONS.—The Electricity Committee has authorised the following works :—Cables from Four Lane Ends to Allerton and Sandy Lane, and erection of transformer chamber at Sandy Lane, £15,241; cables in Low Moor district, £3,517.

Chesterfield.—LOAN SANCTIONED.—The Electricity Committee has obtained sanction to a loan of £4,548 for wiring consumers' premises.

Continental.—SPAIN.—The programme of the Echevarrieta group for the utilisation of the Douro waterfalls seems to present a better aspect owing to the attitude of the present Government. The proposed works include two waterfalls of a maximum yield of 266,000 h.p. and a force of 126,000 h.p. at low water and three waterfalls with a constant power of 46,366 h.p., all in Spanish territory. The two waterfalls studied in connection with Portugal will supply about 400,000 h.p. all the year round.—*Reuter's Trade Service* (Madrid).

Dalkeith.—TRANSFER OF UNDERTAKING.—The Town Council is to take over the electricity undertaking on April 1st next.

Derby.—WIRING OF SMALL HOUSES.—The Corporation Electricity Committee has allocated £5,000 from the appropriation account towards the cost of wiring Corporation houses for electric light.

East Ham.—NEW ELECTRICITY CHARGE.—The Electricity Committee has recommended to the Council that the following domestic tariff be approved as an alternative charge for electricity supplied to premises used solely for residential purposes :—A fixed quarterly charge varying from 16s. for a five-roomed house to 37s. for a 12-roomed house, plus 1½d. per kWh for energy consumed for all purposes, with a discount of 5 per cent.

Fraserburgh.—ELECTRICITY SCHEME.—A special committee of the Town Council has considered a proposal for an electricity supply and has recommended that if electric lighting be introduced it should be by the Council in preference to an outside company. The Council is to prepare a scheme.

Gelligaer.—ELECTRICITY EXTENSIONS.—The Urban District Council is applying for sanction to the borrowing of £10,059 for its electricity undertaking, and £5,000 for mains and services.

Glasgow.—PROGRESS AT DALMARNOCK STATION.—Satisfactory progress continues to be made with the equipment of the new section of the Corporation's Dalmarnock power station. The boilers are in course of installation in No. 3 boiler house, while the first of the four 20,000-kW Parsons turbo-alternators is approaching completion and is expected to take up its share of the load by about the end of the present month. When the present extension is complete, approximately 80,000 kW will be added to the present capacity of 100,000 kW.

Gravesend.—LOANS.—The Electricity Committee is applying for sanction to loans of £4,027 for foundations for turbine and condensing plant, £4,216 for switchgear, and £6,816 for a Yarrow boiler.

Horsham.—WIRING OF SMALL HOUSES.—The Urban District Council has applied for sanction to a loan of £1,000 to cover the estimated cost of a scheme for the wiring of premises for consumers. It is proposed to charge a rental of ¾d. per point per week, and a scale of charges on this basis has been drawn up.

Holbeach.—ELECTRICITY SCHEME.—The Urban District Council has decided to adopt a proposal to obtain an electricity supply from the Boston Electricity Supply Co. The company is to act as the distributor, and the maximum price is to be 10d. per kWh. The Council is to have the option of taking over the undertaking on a special or "goodwill" basis at the end of 21 years, and on the ordinary basis at the end of 42 years.

India.—HYDRO-ELECTRIC DEVELOPMENT.—According to the *Indian Textile Journal*, hydro-electric plant totalling 91,325 h.p. has been installed in the country, the largest installations being the plant of the Tata Hydro-Electric Power Supply Co. (50,000 h.p.), and Cauvery power scheme (22,650 h.p.). The following plants are under construction :—Andhra Valley Power Supply Co., 64,000 h.p.; Tata Power Co. (first stage only), 75,000 h.p.; Burma Mines, Ltd., 9,750 h.p.

Irish Free State.—WATERFORD.—At a recent meeting of the directors of the Waterford Chamber of Commerce it was agreed to instruct the Chamber's solicitor to oppose the Waterford municipal electric lighting scheme at the forthcoming Government inquiry. It was felt that the proposed scheme was inopportune on account of the present high city rates, and the prospect of electricity being supplied from the Shannon scheme within the next few years.

Japan.—ELECTRICAL DEVELOPMENT.—The Nügata Denki K.K. proposes to erect a hydro-electric power station with a capacity of 20,000 h.p. on the Shinano river.

The Yamagata Denki K.K. has decided to erect a steam power station at Shiogama-Machi, Miyagi-ken, at a cost of 540,000 yen, the work to be completed by next winter.

Kendal.—LOANS.—The Town Council has applied for sanction to loans of £3,000 for mains, £500 for services, and £1,200 for a battery room.

Lexden and Winstree.—ELECTRICITY SUPPLY.—The Rural District Council has decided to support the application of Colchester Town Council for a fringe Order to supply electricity in the rural area.

London.—CITY ELECTRICITY CHARGES.—The Charing Cross Electricity Supply Co., Ltd., announces that the following scale of charges for electricity will have effect as from January 1st last :—Lighting : In the winter quarters, 6d. per kWh for the first 7 kWh per 30 watts connected, and in the summer quarters 6d. per kWh for the first 3 kWh per 30 watts connected, and 2½d. per kWh for all energy consumed in excess of such quantities. Power : 2d. per kWh. Heating : 1½d. per kWh.

HACKNEY.—According to *The Times*, at a town's meeting on January 16th approval was given to a Bill, to be promoted by the Borough Council in the next session of Parliament, to confer additional powers on the Council in relation to its electricity undertaking. The measure contains a clause which will enable the Council to obtain land for a new sub-station at a cost of £86,000, which is the only capital expenditure contemplated under the Bill.

Luton.—LOAN SANCTIONED.—The Electricity Committee has obtained sanction to the borrowing of £18,175 for feeders, £6,955 for services, &c., and £7,583 for sub-station equipment.

Malvern.—PRICE REDUCTION.—The Urban District Council has reduced the charge for electricity for power and heating by 1d. per kWh.

Middlesbrough.—PROPOSED NEW POWER STATION.—The Cleveland and South Durham County Electric Power Company has written to the Electricity Committee giving revised terms for a new bulk supply agreement to come into force on November 1st, 1927, the terms being based on the Corporation's taking the whole of its electricity requirements from the company's mains, the Snowdon Road power station being shut down, with the exception of the two gas sets, which would be utilised only for stand-by purposes. The engineer has submitted a report on the question of electricity supply and has recommended that the Corporation should erect a new power station with a capacity of 9,000 kW. At a meeting of the Corporation on January 12th it was decided that the borough electrical engineer's report should be adopted, and that the Cleveland and Durham County Electric Power Co. should be informed that the Corporation was satisfied that it could produce electrical energy at a lower price than that quoted by the company, and that the Corporation had accordingly decided to proceed with the erection of its own generating station for supplying to its consumers when the agreement with the company terminates in September, 1927. The Town Clerk has been authorised to make application for approval to the scheme, and for sanction to a loan of £141,346, being the estimated cost thereof.

Milton Regis.—ELECTRICITY SUPPLY.—The Urban District Council has decided to apply to the Kent Electric Power Co. and others to supply electricity to the district and has asked the Milton Rural District Council and the Sittingbourne Urban District Council to co-operate in the matter.

Musselburgh.—PURCHASE OF UNDERTAKINGS.—The Town Council has appointed a special committee to report on its powers under Provisional Orders to acquire the local electric light and tramway undertakings in view of the fact that the Council's option to purchase expires in June.

Northern Ireland.—CASTLEBLANEY (Co. MONAGHAN).—The Urban District Council has approved an agreement with a Belfast firm for a public installation of electric lighting, the scheme to be completed by September next.

NEWRY (Co. DOWN).—The Urban District Council has adopted the revised estimated of £17,500 for the installation of a public electric lighting scheme, as submitted by Mr. P. A. Spalding, municipal electrical engineer, Dundalk.

Queensbury.—ELECTRICITY SUPPLY.—The Urban District Council has approved a plan submitted by the Yorkshire Electric Power Co. of proposed overhead lines in the district.

Rhyl.—LOAN.—The Urban District Council has applied for sanction to a loan of £10,000 for electricity purposes.

Shrewsbury.—ELECTRICITY EXTENSIONS.—The Town Council has approved a scheme for extensions at the electricity works which includes the erection of a new engine room, and the installation of a 400-kW generator, to be followed, probably immediately on the completion of the first set, by a second similar set. The building and installation of the first set is estimated to cost £15,000. The scheme has been approved by the Technical Sub-Committee of the West Midlands Electricity District.

Special Orders.—The Electricity Commissioners have submitted to the Minister of Transport for confirmation a Special Order made by them authorising the Lancashire Electric Power Co. to supply electricity in the urban district of Walton-le-Dale.

Application has been made by Mr. J. A. Purves for a Special Order for the supply of electricity in the urban district of Brampton.

Tadcaster.—ELECTRICITY SUPPLY.—The Rural District Council has consented to an application by the Electrical Distribution of Yorkshire, Ltd., for a Special Order to supply electricity within the Council's area on condition that a fixed time is to be stated for the supply of electricity to be available.

United States.—ELECTRICAL DEVELOPMENT.—According to *Power*, the rapidly increasing load supplied by the Niagara system and the necessity of maintaining a proper balance in the supply of steam and hydro-electric power have made it necessary to add a 60,000-kW turbine to the equipment of the River Station of the Buffalo General Electric Co. The station at present includes three 20,000-kW and one 35,000-kW turbo-generators.

Announcement has been made by the Byllesby Engineering and Management Corporation, that an order for eight 13,500-h.p. waterwheels has been placed with the Allis-Chalmers Manufacturing Co. This equipment is for the new Falls of the Ohio River station being built on the Ohio River at Louisville.

The growing demand for electric power in Florida has caused the completion of negotiations by the Florida Power & Light Co. for the purchase of land on the New River near Fort Lauderdale, on which work will be begun immediately for the construction of a new steam generating station to have an ultimate capacity of 100,000 kW. Orders have already been placed for two 25,000-kW high-pressure steam turbines, boilers and auxiliary equipment for this station, and it is expected that the first unit of the plant will be installed and in operation by the end of 1926 or early in 1927. The station will be equipped to burn either coal or fuel oil or both.

Watford.—LOAN.—The Electricity Committee is to apply for sanction to a loan of £20,378 for sub-stations, switchgear,

Tramway and Railway Notes.

Bradford.—TRACK RENEWALS.—The Tramways Committee, after considering a report submitted by the city engineer on track reconstruction work during the coming year has recommended the following renewals:—Manningham Lane, from North Parade to Oak Lane, £27,715; Barkerend Road, from Otley Road to Byron Street, £14,740; and Barkerend Road, from Rushton Road to Leeds Road, £8,262; total, £50,717.

Continental.—NORWAY.—An underground railway is to be constructed by the City of Oslo, the capital of Norway, from Majorstuen, a station on the Holmenkollen Railway in the suburbs of Oslo, to the centre of the city. The tunnel will carry the trains of the four lines handling the heaviest traffic from the surrounding districts to Oslo, namely, Holmenkollenbanen, Smestadbanen, Sognvandsbanen, and Baerumsbanen.—*Commerce Reports.*

AUSTRIA.—The electrification of the Austrian Federal Railways is progressing in proportion to the release of funds from the balance of the League of Nations credits set aside for investment purposes. In addition to the 56 electric locomotives ordered last year, the greater number of which are already in operation, 50 additional locomotives have been ordered, delivery to be made progressively until the end of 1927. It is planned to reinforce the principal portions of the main lines at a future date, more especially the line Vienna-Salzburg, in order to permit the use of a stronger type of locomotive.

FRANCE.—The Paris correspondent of the *Daily Mail* reports that the Paris Municipal Council is to remove a number of the main tramway tracks running to the centre of the city and to confine the working of other tramways to early morning and shopping hours. It is proposed by the Council that, as a first step, the tramway terminus at the Opera end of the Rue du Quatre Septembre should be abolished and a new terminus for these tramway lines found outside the congested area. The same measure is to be adopted for some of the many lines which converge towards other parts of Paris, including those near the Gare du Nord. During the hours when tramway services will be prohibited motor-omnibuses will be substituted.

Dundee.—PROPOSED PURCHASE OF UNDERTAKING.—The Town Council has under consideration a proposal to acquire the undertaking of the Dundee, Broughty Ferry and District Tramway Co., Ltd., at a cost of £85,000.

Irish Free State.—DUBLIN.—The scheme for the extension of the Dublin tramway service to Lucan has successfully passed the negotiation stage, and as soon as the necessary legal formalities are completed the work of relaying the track to the wider tramway gauge will be commenced. Negotiations are also proceeding satisfactorily with the object of extending the tramway service from Dublin to Blessington, and it is anticipated that in the near future the two districts of Lucan and Blessington will be linked up with the Dublin tramway system.

Liverpool.—FAILURE OF NEGOTIATIONS.—It is reported that negotiations for the acquisition by the Corporation of the Waterloo tramway system have failed, and that a contract has been signed for a motor-omnibus service between Seaforth and Great Crosby for a period of five years.

Manchester.—TRANSPORT IMPROVEMENTS.—According to the *Electric Railway and Tramway Journal*, the Corporation Tramways Committee is contemplating the expenditure of £320,000 for the following purposes:—£14,000 for motor omnibuses; £105,000 for permanent way, new buildings, &c., £170,000 on car works extensions; £12,000 on equipment; and £15,000 for machinery for car works. The proposed extensions will practically double the capacity and the area of the car sheds. The Corporation intends to resume the construction of its own tramcars, the pre-war output of which was one car weekly.

Stretford.—LOAN SANCTIONED.—The Electricity Committee has received sanction to the borrowing of £10,373 for tramway construction and electrical equipment.

United States.—RAILWAY ELECTRIFICATION.—According to the *Electric Railway Journal*, Vice-President Le Boutillier, of the Long Island Railroad, on December 24th laid plans before Mr. R. Nixon, chief engineer of the Public Service Commission, for further electrification of the Long Island Railroad from 1926 to 1929, at a cost of $12,600,000. The improvements proposed are as follow:—1926. Electrification of the Bay Ridge Division and the Bay Ridge yards ($4,040,000). 1927. Electrification of the Montauk Division, from Long Island City to Holban yards and the yards at Long Island City, Blissville, French Pond, and Holban ($6,010,000). 1928. Electrification of freight sidings on the North Side Division, the main line between Long Island City and Jamaica and on the Atlantic Division ($1,205,000). 1929. Electrification of the remainder of freight sidings in territory now electrified for passenger service ($595,000).

Uruguay.—RAILWAY ELECTRIFICATION.—According to *Commerce Reports*, the management of the Ferrocarriles y Tranvias del Estado in Uruguay has under consideration the partial electrification of the Ferrocarril del Norte (Northern Railway) from Montevideo to Santiago Vazquez on the Santa Lucia River, a distance of 19.5 km. La Transatlantica, a German street-car system of Montevideo, and the railway management are negotiating an arrangement whereby the company will operate a street-car service over the track of the Northern Railway in lieu of building a new and competitive line.

Telegraph and Telephone Notes.

Australia.—NEW CABLE.—There sailed from Greenwich, on January 15th the cable ship *Colonia*, the largest cable ship in the world. She is to lay a duplicate cable over the 1,800 nautical miles between Cocos (Keeling Islands), in the Indian Ocean, and Fremantle, Australia. More than ordinary interest attaches to the operation because the cable is of the new loaded type, and is the first British owned and manufactured loaded cable to be put down. It is the property of the Eastern Extension, Australasia and China Telegraph Co., Ltd., one of the Eastern Associated Telegraph group, and will be operated by British interests. Whereas the existing line from Cocos to Freemantle has a working capacity of 145 letters a minute, the new line is designed for a speed of 2,100 letters. This result has been obtained by winding round the core strips of a new metal capable of carrying additional current. The new cable is not in substitution, but in duplication, of the existing facilities, and will give the Eastern group yet another route connecting Europe and Australia. That means developing further the lines between Freemantle and Adelaide, a matter now under consideration. The *Colonia* is expected to arrive at Cocos about the middle of February and to complete the laying of the cable at Freemantle early in March. With the *Colonia* has sailed, as a junior cable engineer, Mr. John Jocelyn Denison-Pender, son of Mr. John C. Denison-Pender, vice-chairman of the Eastern Telegraph Co., and grandson of Sir John Denison-Pender, the chairman. Young Mr. Denison-Pender is thus the fourth generation of the Pender family to be actively interested in cables.

(*Continued on page 143*)

A Modern Cable and Rubber Factory.

A Visit to the Works of the St. Helens Cable and Rubber Co., Ltd.

THE St. Helens Cable & Rubber Co., Ltd., derived its origin from the firm of Messrs. W. & J. Glover and Co., whose works were at St. Helens, from which town the first-mentioned firm takes its present name. Messrs. W. & J. Glover & Co. were well-known manufacturers of wire and wire ropes, and had an extensive connection amongst the collieries. This business, together with that of Messrs. Hanchett & Co., Ltd., rubber manufacturers, was acquired by the St. Helens Cable Co., Ltd., which was registered in 1899 to take over the business of cable, wire-rope and rubber manufacturing, with works at St. Helens and Warrington. At the former place the manufacture of wire ropes was continued, and also the drawing of iron and copper wire, while the Warrington Works was devoted to the manufacture of electric wire and cables and also rubber tires and other mechanical rubber goods. The development of the pneumatic and solid-tire industry eventually led to the introduction of the cab-tire sheathed cable, with which probably all electrical engineers associate the name of the firm in question. With the commencement of the making of rubber tires the name of the undertaking was once again changed, and it became as it is styled at present, the St. Helens Cable & Rubber Co., Ltd. In 1923 the increase in the firm's productions rendered it necessary to establish a larger factory on more modern lines, and after a considerable search the present factory at Slough was chosen. It is part of the huge works built by the Government during the war which were to have been used for the repair of automobiles, and which is now owned by the Slough Trading Company.

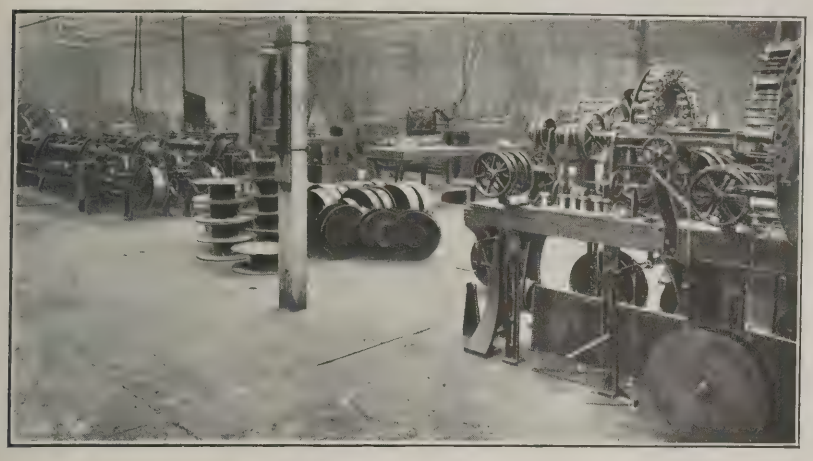

Fig. 1.—Fine-Wire Stranding Machines.

Although the manufacture of "C.T.S." cables forms the principal feature of interest in the works, at any rate from the point of view of the electrical engineer, many other products are of interest, including rubber insulating mats, gloves, and overshoes; the making of ebonite is also a special feature. The premises, which cover an area of 258,000 square feet, are of modern construction with only one floor level and good natural lighting, bordered at opposite ends by sidings of the G.W.R. These are each run in a covered way flanking the premises with the necessary loading and unloading platforms on the same level as the factory floor. The north end is arranged as the import section and the opposite end forms the export branch, the whole of the factory being set out so that the raw materials received at the import end travel as nearly as possible in a straight line in the works through the different processes of manufacture till they reach the export room in the completed stage.

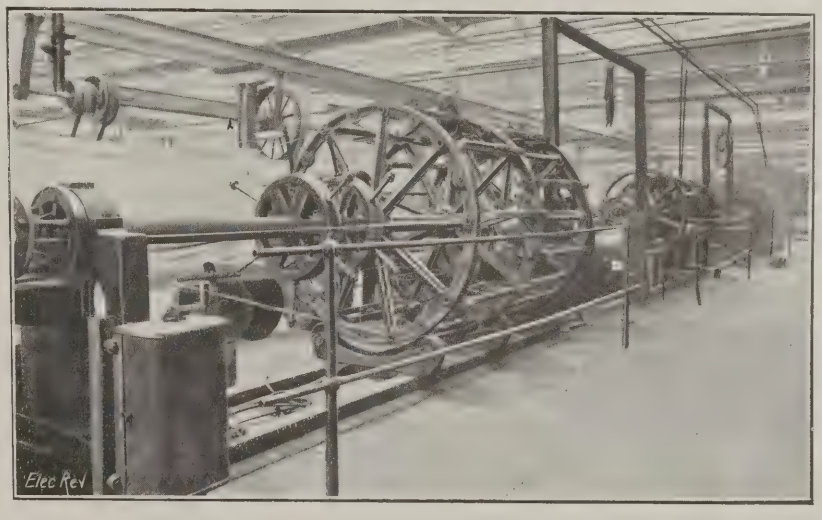

Fig. 2.—Large Stranding Plant.

Fig. 3.—Cotton-Covering Section.

The factory proper is arranged in two main sections, one devoted chiefly to the preparation of rubber for its many uses, and the other to cable stranding, covering, &c. All the wire used is received already drawn to the required sizes from one of the associated companies of the firm. The first operation in the making of cables, stranding, is effected immediately inside the main factory at the import end. Fig. 1 shows some of the fine-wire stranding machines, and fig. 2 is a view of some of the larger machines employed in this process. In the first-mentioned illustration the machines were dealing, when we recently visited the works, with flexible cord containing up to 70 wires. Adjacent cotton-covering machines, fig. 3, deal with wires required for instruments,

&c. Bunching machines, in which the strands are merely assembled without twisting, for the sake of flexibility, form a feature in this portion of the works. A twinning machine, which can be adapted for either stranding or twinning operations, is another item of interest; it follows closely the design of a special machine which is used for the combined operations of twinning multi-core cables and taping between the cores as they are assembled. The latter operation is employed in the making of C.T.S. cable so as to ensure that, besides surrounding the cable as a whole, the cores are each separately encircled with a coating of the sheathing material. Heavy-stranding revolving-bobbin machines are also installed for dealing with the larger cables.

The insulating of the cores is an interesting branch of the work. Rubber-taping machines are employed in this process, the bare cores being taped with pure-rubber strip. It is interesting to note that the ends of the rubber strip are welded together when necessary by simply beating them together in a similar manner to that employed in iron forge-welding. The insulating rubber is supplied from the rubber department in different colours, indicating the various classes up to the 2,500-megohm grade. The colours are all of light shades, enabling the tester to easily discern any foreign matter or other defects in the rubber during the two examinations to which it is subjected when it is in sheet form. Other covering machines are of the grooved-roller type, fig. 5, in which the core is sandwiched between two rubber strips, and on which both the pure-rubber and the compounded-rubber insulation, the separator and the jacket, are applied by one machine. Other machines, which deal with h.p. cables, serve the cores with two layers of each insulation.

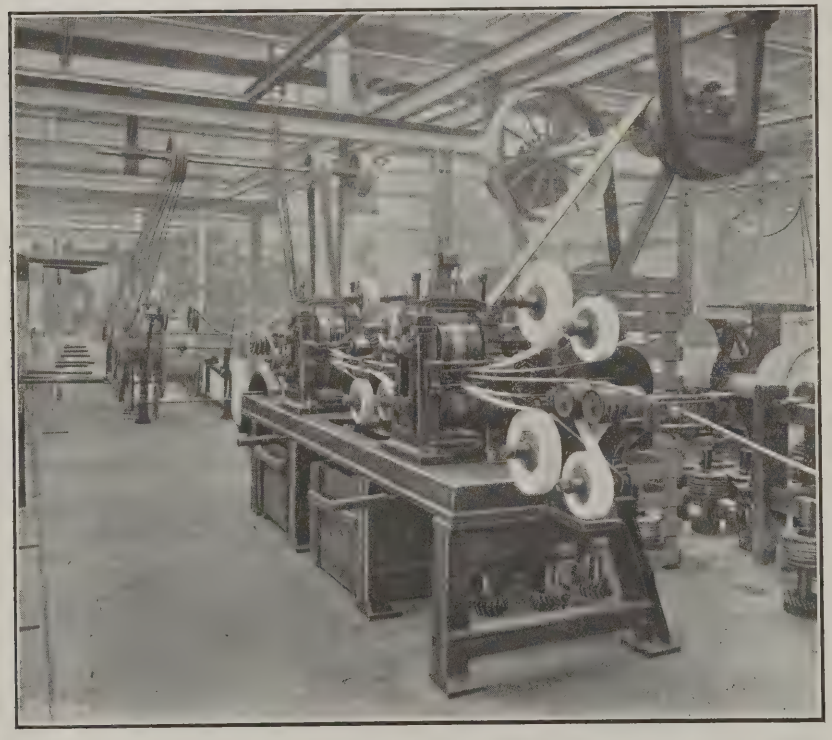

Fig. 5.—Grooved-Roller Rubbering Process.

A considerable number of braiding machines of the vertical type are also installed to deal with ordinary v.i.r. cables. The latter are finally dealt with in colouring troughs. Two large laying-up and armouring machines, on which colliery cables are dealt with, form another important part of the equipment. These are of the revolving-bobbin type.

The application of the cab-tire sheathing is effected in the rubber preparation department. Here forcing machines, fig. 4 of various sizes are employed on this work. The "cab-tire" is fed into these machines at the top; it is "minced" and applied hot to the cable by means of a die-mould through the centre of which the cable is drawn at right angles to the direction of application. A fine thread is drawn in the sheathing of all cables of this class, as a maker's distinction mark. As the sheathed cable is received from the machine it is paid out on to a revolving circular tray, where it is covered with french chalk; later on it is vulcanised.

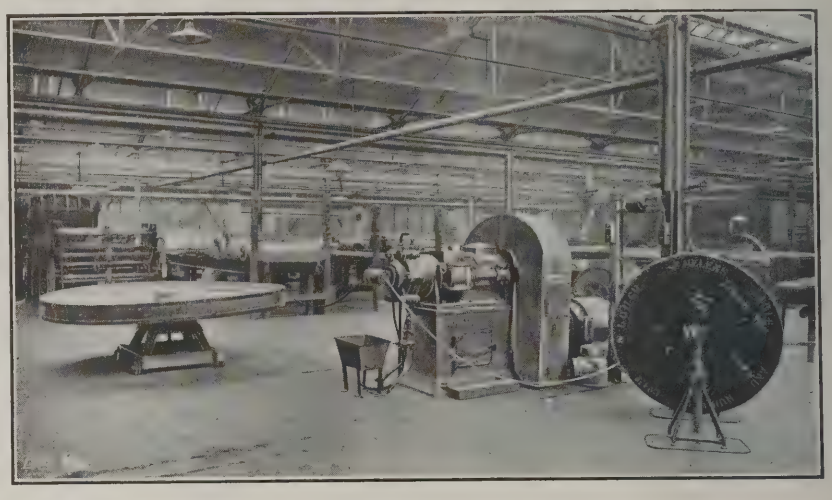

Fig. 4.—Rubber-Forcing Machines.

Of particular interest is the rubber department. Here rubber is received from the Malay States in two grades, refined rubber, which has been collected direct from the tree cups, and a coarse grade, or "browns," which consists largely of the leakage gums which run down the tree bark. The first-mentioned grade is used for insulating, and is received in sheets packed in wooden cases, as is the crude rubber, which is employed in the sheathing. The sheets are hung on racks in large drying ovens through which a current of warm air is circulated by means of a fan placed on the top, which sends the air first through a steam-heated coil.

The rubber is first dealt with, after drying, by masticating machines, fig. 6, on which the material (raw rubber) is applied to a pair of steel rollers, similar in construction to an ordinary mangle, except that they are placed side by side. The rollers, which are steam heated, travel at different speeds, so that the rubber, which is left adhering to the rollers for several hours, is constantly being "churned." According to the class of compounded rubber or ebonite required, sulphur, zinc oxide and various "drugs" are fed into the revolving mass periodically during the process. The mixed compound is run through calenders, fig. 7, into sheets of various thicknesses according to the purpose for which they are required. Thin sheets prepared for the manufacture of gloves, insulating tape, &c., are afterwards rolled in cloth until the rubber is dry. The calenders are of the triple steel-roller type, the rollers being heated by means of steam.

Another interesting operation is that of rubber spreading. The pure rubber for insulating tape is treated by this process, which is effected in an entirely separate building on account of the quantity of naphtha used. The rubber is first put into tubs, where it is served with naphtha until it becomes a plastic substance, when it is suitable for application to the spreading machines

(fig. 8). A pair of rollers force the mixture under a knife-gauge on to a steam-heated table, on which the thin sheet of the mixture is spread on to a travelling

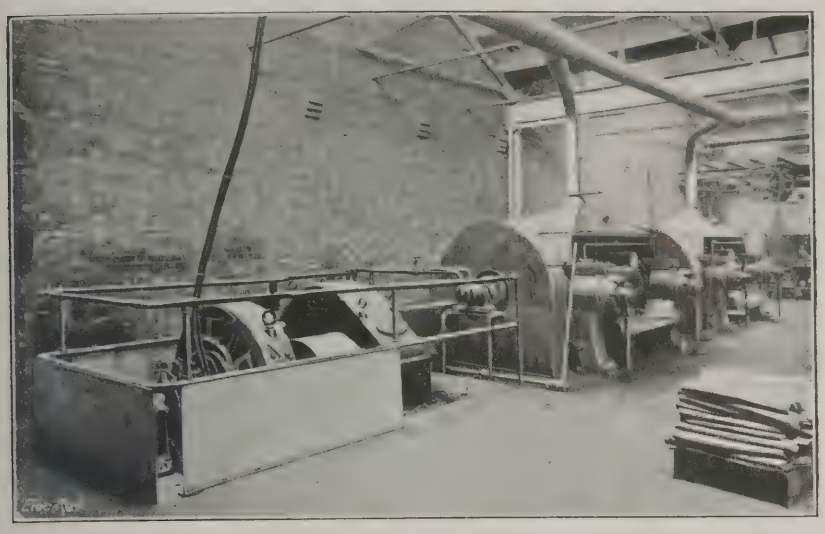

Fig. 6.—Rubber-Masticating Machines.

cloth. Other processes, in which the mixture is forced into the mesh of canvas, result in a reinforced rubber for such articles as pneumatic tires.

Three large vulcanising tanks for dealing with cab-tire cables are installed. Matting presses also form an important feature of the works; in these rubber mats are vulcanised and shaped in one operation. The press pans are steam heated and the face plates have various corrugated designs, giving the required finish to the product. The press is operated under hydraulic pressure. Similar machines to these are used for the preparation of ebonite sheets. A fully-equipped testing room is provided to deal with all the finished electrical products. A 25-kW generator feeds a static transformer from which pressures up to 100,000 V can be obtained. Two 600-V "test-tube"-type accumulators are also installed for the purposes of dielectric tests, &c. An interesting piece of apparatus in this department is a sheet-ebonite testing device, a patent of the firm. It consists of two rollers of small diameter, held about 1/16th in. apart in a suitably insulated frame and handle. A circuit in which a mirror galvanometer is conveniently arranged applies a pressure of 600 V between the two rollers. The latter are wheeled over the surface of the ebonite so that both of their peripheries are in contact with the sheet surface. Any appreciable defect, such as a piece of conducting material in the compound, will result in a current passing between the rollers, giving rise to a deflection of the galvanometer. The water tanks for cable-immersion tests are conveniently placed adjacent to the test room.

One may be justified in assuming that in a rubber factory a fully-equipped laboratory is at least as essential as in any other industrial concern. For each consignment of rubber imported, fresh data for the mixing operations have to be prepared experimentally, because the different rubbers vary in quality to such an extent. Such a department forms a particularly interesting and important branch of the St. Helens works. It is equipped practically as a miniature factory. A masticator, vulcaniser, and hot presses, &c., enable the main and essential processes of the factory proper to be undertaken on a sufficiently large scale to allow the necessary data to be determined. An important piece of apparatus is a tensile testing machine, which registers both the breaking strain and the stretch of samples of rubber automatically. The necessary "pull" is applied to the rubber by means of a small electric motor acting on a highly-geared chain-pulley system; the recording is effected by means of a similar gearing. Many extended time experiments on samples of cab-tire sheathing add to the interest of the laboratory. Pieces of the material are bottled in various acids and other solutions, where in some cases they have remained for several years with no apparent ill effects. A small shop is set aside for the preparation of samples of the firm's products. Some recent additions to these are ebonite sheeting prepared in attractive designs, such as imitation marble, and the like.

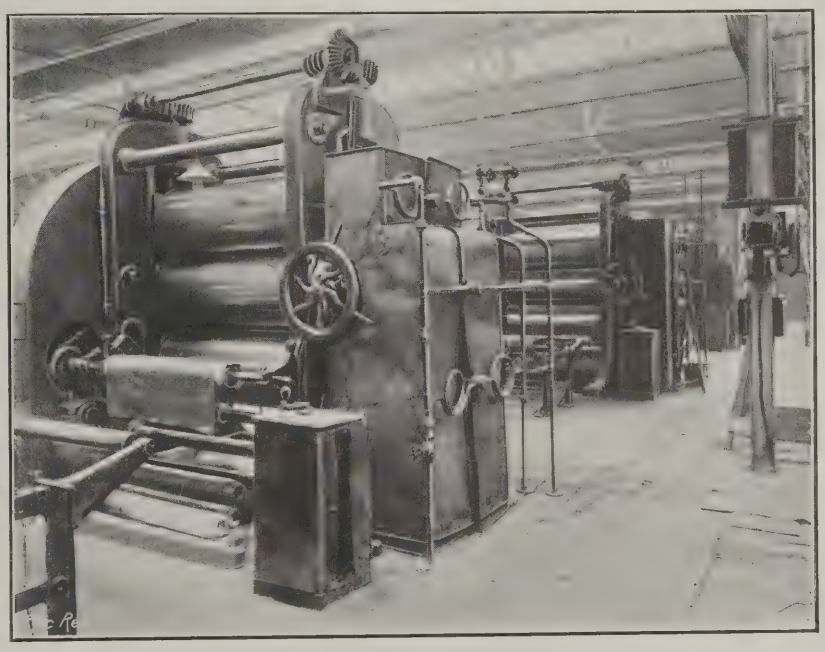

Fig. 7.—Rubber-Rolling Callenders.

The whole of the machines throughout the factory are electrically driven, and in most cases, especially with the larger plant, figs. 6—8, individual motor drive is employed. The motors, some of which were originally installed in the Warrington works, are all d.c. machines and the electricity supply, received from a local company's power station on the estate at 460 volts, is a.c., 3-phase. A transforming and converting station affords the neces-

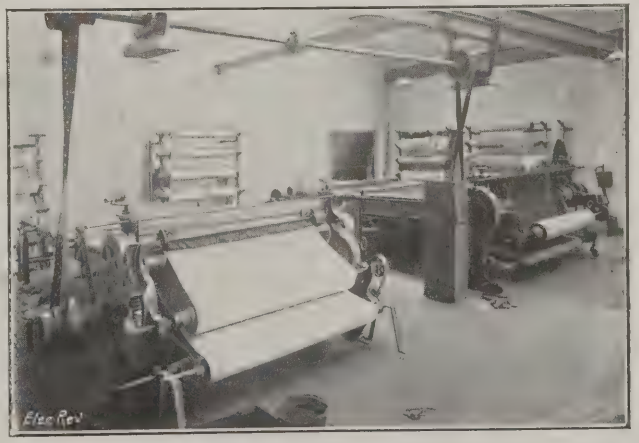

Fig. 8.—Spreading Machines.

sary means of conversion and distribution. It is equipped with three static transformers, supplying three rotary converters, and a 9-panel generating and dis-

tribution switchboard. It is interesting to note that the transformers were originally in use at the previous works, where they dealt with an incoming h.p. supply. They have been re-wound to reduce the present supply pressure to that necessary, 440 V, for the rotaries. Mechanical and electrical workshops are equipped with lathes and other repair gear required to effect the repairs to the running plant, &c. Small outhouses constitute a carpenter's shop and forge for similar purposes. A hydraulic installation serves the vulcanising presses, &c. Pan-type vulcanising tanks to deal with carriage tires are also provided for by this installation. A feature of the vulcanising equipment consists of special tanks in which the Peachey process for rapid vulcanising is employed, the principle being the effect produced by two gases impinging on the material.

Apart from the manufacture of the main products mentioned, numerous articles of all descriptions are prepared from the rubber compounds, including many electrical safety appliances. Specially constructed insulating gloves are a recent development. These are coated at the parts most subjected to wear with an extra layer of red cab-tire material, which, when worn through to the black material beneath, gives a warning of its wear to the user. A jointing "N" tape is another speciality; this consists of a layer of compounded rubber faced with one of the pure material, the object being to combine the high insulating properties of pure rubber with the good mechanical properties of the compounded substance. It is interesting to note that there is still a large output of solid cab tires to India.

The electrical installation is wired throughout with C.T.S. Mains are run externally along the walls of the main building so that they are exposed to the sun and all weathers. Inside the factory mains are run along the steel girders, and in many cases, as shown in fig. 7, the motor leads from the starters, &c., are run down supporting girders and buried direct in the concrete flooring.

It is interesting to note that the ebonite department is at times called upon to turn out as much as 5 tons per week of sheet alone. By far the greater part of the floor space in this department accommodates plant for the manufacture of mouldings, accumulator cells, loud-speaker horns, &c.

Although a considerable number of the employés are housed on the estate, the majority live in the town of Slough—about two miles away. A service of 'buses

Fig. 2.—Kerstelenbach Viaduct.

runs to and from the estate at convenient times, of which many take advantage. Efforts are made to provide social attractions for the employés. The firm runs its own football, tennis, cricket and bowling clubs, and a football ground is situated quite near the works. A club room situated in Slough proves a great attraction for many of the hands.

An association of the occupiers of the various factories, &c., throughout the estate has been the means

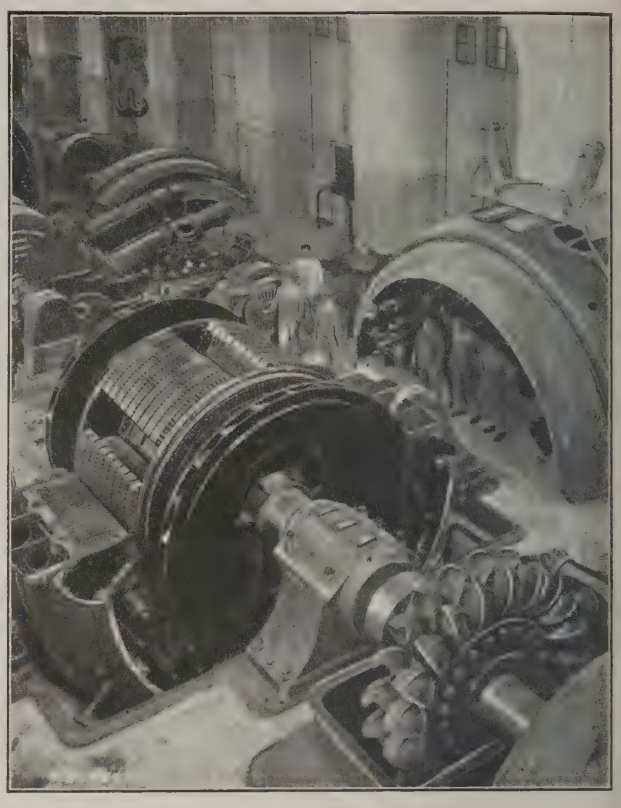

Fig. 1.—Turbine Room, Amsteg.

of adding considerably to the comfort of everybody working there. One example of the useful work done in this direction is the lighting by electricity of the main Bath Road between the estate gates and Slough.

Swiss Electrification.

The first illustration on this page shows the interior of the turbine room of the Amsteg hydro-electric generating station (Electrical Review, October 9th, 1925), one of the principal sources of energy for the Swiss electrified railways. The station utilises the water power of the River Reuss, between Gurtnellen and Amsteg. Provision is made for six 10,000-kW turbine generators, five of which were completed towards the end of last year when the sixth machine was well in hand. The turbines are of the Pelton type, and are served by three steel pressure conduits, each 1,476 ft. long and with a diameter varying from 5.25 ft. at the lower end to 5.9 ft. They are designed to work under a head of 902 ft., with a delivery of 1,045 gallons per second, running at 333½ r.p.m. The turbines are direct coupled to Oerlikon alternators.

Fig. 2 shows the Kerstelenbach viaduct, near Amsteg, on the electrified railways of the Swiss Federal Railways, recent reports on which record an economy of 21 per cent. on the former working expenses, and a gain on the rolling stock, in that 79 electric locomotives have easily done the work of 100 steam engines. The C.F.F. is still using 251 steam engines in the unfinished section of the lines, but at the end of last year it already had in the first "Arrondissement" 29 electric locomotives of the "Séchéron" type, 24 of the "Brown, Boveri"

type, and 8 "Séchéron" auto-motors running on single-phase; also 8, including 7 of the "Brown, Boveri" type, for three-phase working.

While the electrification has introduced a new factor of danger for men working on the C.F.F., if one compares the statistics of railway accidents in Switzerland with those of other European countries, one is forced to admit that fewer accidents take place on the Swiss side of the Alps than anywhere else, and that a record of one traveller killed and four hurt per ten million persons carried is very reassuring as to some of the advantages of electric traction and good engineering.

The construction of a power station not far from Einsiedeln, at Etzel, is being considered by the Federal Railways, but this presents a serious difficulty. The barrage to be constructed would confine a formidable mass of water with a surface area of about 3,800 acres, of which about 1,000 would be redeemed from the valley of Wäggi. The creation of this artificial lake would completely destroy a flourishing agricultural district. It appears that 46.7 per cent. of the land is communal property, but the remaining 53.3 per cent. is private, so the question of indemnity looms large in the new scheme.

Telegraph and Telephone Notes.

(*Continued from page 138.*)

Storms in France.—DISORGANISATION OF TELEGRAPH AND TELEPHONE SERVICES.—Some idea of the extent to which the telegraph and telephone services in France were affected by the incessant storms which raged throughout the country from December 20th to December 31st may be gathered from a communication issued by the Ministry of Commerce, Posts and Telegraphs. In all, the total length of wire lines blown down exceeded 30 kilometres, while thousands of telegraph poles were overthrown. The damage was particularly serious in the Paris suburbs; 53 poles supporting 84 wires came down on the railway at Pierrelays; at Herblay 15 poles bearing 50 wires fell on a train, happily without causing any serious accident. Over a kilometre of the important system of 130 wires connecting Lille with Dunkerque was blown down, while over a distance of several kilometres the Paris-Belfort system collapsed near Troyes. Near Saint Quentin the international Paris-Erquelines line was damaged, and over four kilometres the Paris-Brest line was felled to the ground.

The telephone system was badly interfered with; on December 31st only 584 trunk lines out of 1,153 were working; of the main telegraph lines 355 out of 425 were put out of action. Every effort was made to adopt temporary measures to ensure communication, but often repaired lines were blown down again immediately. It took a full fortnight after the last days of the gale to bring the telegraph and telephone systems back to normal.—*Reuter* (Paris).

Radio-telegraphy rendered good service to the ordinary telegraph service during the stormy period. The French station at Saint Assise, during one day recently, transmitted 32,000 words to London and other destinations when the wire lines were hard pressed owing to breakdowns, says the *Daily Telegraph*. The schedule arranged was faithfully adhered to and every message was sent out on time.

Eastern Europe.—NEW WIRELESS SERVICES.—Marconi's Wireless Telegraph Co., Ltd., announces that new radio-telegraph services have been inaugurated between Great Britain and Yugo-Slavia and Bulgaria; messages for those countries should be marked "*via* Marconi," and the rates are as follows:—Yugo-Slavia, urgent 10½d. per word, ordinary 3½d.; Bulgaria, urgent 1s. per word, ordinary 4d.

India.—NEW RADIO STATIONS.—The wireless station which is being erected at Kirkee, near Poona, in the Bombay Presidency, in connection with the Imperial wireless chain, is expected to be ready in six months' time, and to be able to operate at the rate of 1,000 words a minute. There will be five steel masts, each 280 ft. high, in a line pointing directly to the Skegness reciprocal station. The *Daily Telegraph* expects that shortly the station will be enlarged to communicate with Tokio, and also with South Africa. The receiving station at Dhond, 50 miles away, is also progressing.

Latvia.—NEW TELEGRAPH CABLE.—It is reported from Riga that a new telegraph cable is being laid between that city, Dunaberg, and Roistten.

Marine Radio Operators.—STRIKE INQUIRY REFUSED.—About 1,500 ship's radio operators have been on strike for about eight weeks. The Ministry of Labour has refused the application of the Association of Wireless and Cable Telegraphists to hold a court of inquiry.

Sweden.—AUTOMATIC TELEPHONY.—Mr. Lundgren, of the State telephone service in Stockholm, states that the scheme for the introduction of automatic telephony in that city, which is now in progress, aims at the establishment of automatic connections for 12,000 subscribers at the main exchange, and the apparatus is to be delivered in the course of three years in connection with the transfer from the old to the new exchange. In the other exchanges the automatic principle will be applied to a total of 22,000 lines, and the work is to be completed in 1928. It is necessary for the State to introduce the automatic system in Stockholm and Gothenborg for reasons of economy, as the existing expenses with the manual exchanges are too high. After the latter city has been equipped in this manner, the Malmo area will be converted.

The Telephone Service.—RURAL TELEPHONY.—Farmers and the railway companies are co-operating in an interesting scheme. The *Daily Telegraph* explains that the London and North-Eastern Railway Co. conceived the idea of inducing farmers to install telephone lines between their homes and the nearest railway station, and thus keep in constant communication with the market and save considerable time and many ineffective journeys for inquiries. The L.N.E.R. has practically completed its agreement with the Post Office, and it is hoped that the scheme will shortly comprise the whole of the railway systems of the country.

LIVERPOOL DEVELOPMENT.—In the annual report of the Liverpool and District Advisory Committee it is recorded that last year 6,762 telephones were fitted, a net increase (after deducting cessations) of 4,095, or 8 per cent. more than 1924. New exchange premises have been obtained at Hoylake, Huyton, and Upton; a site has been acquired for a new Garston exchange, and building operations are expected to commence very shortly. A site has also been acquired in Limekiln Lane, Liverpool, for a new North exchange; the new building will eventually accommodate one of the automatic exchanges projected for the Liverpool area. In the last 13 years the total underground mileage of telegraph and telephone lines has grown from 99,444 to 194,749. To meet the demand for increased circuits from Liverpool to Manchester a further cable, providing 254 circuits, is to be provided next year. Direct telegraph communication between Liverpool and Antwerp has been definitely authorised, and arrangements are being made for the installation. The restoration of direct communication between Liverpool and Germany is also being considered.

Venezuela.—TELEGRAPH SERVICE.—Reporting to the Department of Overseas Trade on the economic conditions in Venezuela (under date September, 1925), Mr. H. A. Hobson, H.M. Consul at Caracas, mentions improvements that have been effected in the Caracas wireless station, and states that communication with Trinidad has been well maintained; the Maiquetia station has also been in constant touch with Puerto Rico. The Puerto Cabello and Maracaibo stations no longer work, no satisfactory results ever having been obtained from them. The French Cable Company's report shows an increase of some 12,000 telegrams (about 20 per cent.) in 1924 over the 1923 figures. A concession was granted on September 25th, 1924, to a military official in the Telegraph Service to import and sell wireless apparatus and to establish a service of radio concerts. Up to the present, however, no scheme has been formulated and consequently not a single wireless set (except the official experimental ones) has been introduced into Venezuela.

Radio Notes.

Birmingham Station.—NEW STUDIO.—The new studio and office accommodation at 5IT, which was opened on January 20th, gives the station the distinction of possessing the largest studio in the country. The equipment may be said to represent the high-water mark in the development of broadcasting on the transmitting side, for the whole of the apparatus is of the latest type. A point of interest is the adoption of a new method of controlling echo effect in the studio, for the B.B.C. has definitely discarded the belief, so securely held in the early days of broadcasting, that it was necessary to prevent all echo by means of heavy draping in the studio. It is freely recognised now that these conditions do not give the best results, and that a certain amount of echo imparts a pleasing ringing quality to a transmission and enhances the clarity and carrying power alike of music and speech, though the necessary amount of echo in both cases is not the same. Echo must be very carefully regulated and considered in close relationship with the kind of music which is being sent out. In the new Birmingham station the need for variability is provided for by draping, hung as curtains upon a system of pulleys, which will enable the studio director to vary the amount of echo at will.

Broadcast Wave-lengths.—PROBABLE CHANGES.—In connection with the efforts that are being made to reduce interstation interference, it is understood that Bournemouth is the British station selected to take part in the initial tests, in the course of which its wave-length, at present 386 metres, will be changed at different times to 250, 350, and 500 metres. The foreign stations which will co-operate are *Petit Parisien* (Paris) and those at Berlin and Rome, all of which, says the *Daily Mail*, will broadcast simultaneously on the same wave-length. If the experiments show that the stations can transmit without jamming one another, tests with other groups of stations will be made, and the results will be placed before the International Wireless Conference for drawing up a plan of group wave-lengths.

El Salvador.—NEW STATION.—The Department of Telegraphs and Telephones of the Salvador Government notifies that the new 500-watt broadcasting station erected in the

capital, San Salvador, will be opened for public traffic shortly. The wavelength employed will be between 400 and 500 metres. The demand for radio receivers of the less expensive types shows signs of expansion, and dealers are making larger stock purchases.—*Reuter's Trade Service* (San Salvador).

U.S.A.—WAVE-LENGTH PIRACY.—In connection with the congestion of the ether through the rapid growth of broadcasting, an important step has been taken by the United States Government in ordering proceedings to be instituted against the Zenith Radio Corporation, Chicago, for pirating a wavelength. When the Zenith Co. applied for a licence it was informed that there was no separate wavelength available, and it was only given permission to share a wavelength with a Denver station. Recently the Zenith Co., says the *Daily Telegraph*, commenced broadcasting on a wavelength allotted to Canada, but hitherto unused. The forthcoming action will be the first test of the Government's power to regulate wavelengths.

India.—NEW STATIONS.—Marconi's Wireless Telegraph Co., Ltd., states that broadcasting in India, which, so far, has been carried on only through the efforts of radio clubs in Calcutta, Bombay, Rangoon, and Madras, will shortly be put on a commercial basis by the grant of a licence to the Indian Radio Telegraph Co. It is reported that the broadcasting stations which the company contemplates building at Bombay and Calcutta, as mentioned last week, will each have a power of 12 kW.

Irish Free State.—DUBLIN STATION.—The Staisiun Craoibscaoileachain Ath Cliath, otherwise 2RN, commenced to broadcast on January 1st, 1926, but already, says *The Times*, its adverse critics largely outnumber those who praise its achievements. So far the station has been broadcasting only for two hours every evening, from 8 until 10 o'clock, and there has been no programme at all on Sundays. In view of the fact that a wireless licence in the Free State costs a guinea, purchasers of crystal sets in the Dublin area complain that they are being treated unfairly, more especially as the standard of the 2RN programmes has not been very high. The announcement of the station director that arrangements are being made to give lessons in the Irish language by wireless has not been received with much enthusiasm anywhere.

Patent Royalties.—A WARNING.—Of interest to amateur constructors of broadcast receiving apparatus is the statement which is understood to have been issued by Marconi's Wireless Telegraph Co., Ltd., to the effect that all persons whatever supplying or receiving by way of sale, gift, or exchange, unlicensed broadcast receivers embodying patents controlled by Marconi's Company, are liable to legal proceedings for infringement. By disposing of, or acquiring, such apparatus upon which no royalties have been paid harm is done to the trade, and Marconi's Co. is accordingly only prepared to authorise amateurs to dispose of a broadcast receiver employing its patents on one single occasion, and then only upon payment of the royalty. The Company will then issue the necessary licence plate for the set. Any person, firm, or company wishing to construct and sell a number of instruments must apply to Marconi's Co., which is prepared to grant licences to *bona-fide* manufacturers in this country.

Regional Stations.—POSSIBLE NEW SHEFFIELD STATION.—It is suggested that Sheffield listeners will probably be amongst the first to try the "regional station" scheme of the B.B.C. Subject to the Postmaster-General's consent, the idea is to build a high-power station some miles north-east of the city, which would be additional to the present relay station (2FN), for the purpose of transmitting two programmes simultaneously. Another similar station may be provided further west too.

Transatlantic Tests.—INTERNATIONAL CO-OPERATION.—For the fourth year in succession transatlantic broadcasting tests are to commence on Sunday night, January 24th-25th. The International Radiophony Bureau at Geneva announces that the broadcasting companies of America will commence the week of trials and continue until the following Saturday. Transmission will be made alternately from both sides of the Atlantic, as the Central European stations, as well as some of our own, have all been allotted special transmitting times. Arrangements have been made to ensure freedom from interruption by stations not transmitting, and the prearranged schedule is in itself an indication of the extent to which international co-operation has been reached. The *Daily Telegraph* regards the inclusion in the scheme of stations in Mexico, Cuba, the Panama Canal zone, and Alaska as a hopeful augury for the future of broadcasting.

Contracts Open and Closed.

(The date given in parentheses at the end of the paragraph indicates the issue of the "Electrical Review" in which the "Official Notice" appeared in our advertisement pages.)

Open.

Australia.—MELBOURNE.—Postmaster-General's Department. March 23rd. Telephone switches.*

March 29th. State Electricity Commission. Transformers and auxiliary apparatus.*

March 8th. City Council. Totally-enclosed armoured type switchgear. Specifications from the City Electrical Engineer's Office, Melbourne.

SYDNEY.—February 10th. New South Wales Government Railways. 100 40-h.p. traction motors; March 3rd, 101 electric car equipments, consisting of motors, control equipments, air compressors, pantographs, &c.; April 14th, one 5-ton fixed electric crane. Forms of tender from Chief Mechanical Engineer, Wilson Street, Redfern, Sydney.

February 17th. 1,500-V, d.c. switchgear for St. Leonards and Hornsby sub-stations; March 3rd, 11,000 V ironclad switchgear for St. Leonards sub-station; March 10th, Stokers or pulverised fuel equipment for three water-tube boilers for White Bay power house. Specifications from Chief Electrical Engineer, 61, Hunter Street, Sydney.

Municipal Council. February 15th. Twenty transformer tanks. February 8th. L.p. cables. Specifications from the Construction Engineer, Electricity Department, Town Hall, Sydney.

March 2nd. Australian Gas Light Co. One 750-kW turbo-generating set. Specifications from the Engineer, Parker Street, Haymarket, Sydney.

Aylesbury.—February 16th. Electricity Department. Overhead 11,000-V transmission lines and cables. (See this issue.)

Bath.—January 29th. Electricity Department. One 6,000-kW turbo-alternator, one water-tube boiler, mechanical stoker and economiser, and one 1,000-kVA transformer. (January 15th.)

Balearic Islands.—Plant, &c., required in connection with the electrification of the Majorca railway. Particulars from the Campañia de los Ferro-Carriles de Mallorca, Palma de Mallorca, Balearic Islands.—*Reuter's Trade Service* (Madrid).

Clitheroe.—February 23rd. Corporation. Transformers, switchgear, and cable connection for sub-station; e.h.p. and l.p. cables, boxes, &c. (January 15th.)

Edinburgh.—January 25th. Tramways Department. 25 air brakes suitable for electric tramway cars. Specifications from manager.

Glasgow.—January 25th. Corporation. Electric lighting installation in connection with Stockwell Street improvement; new buildings in Trongate. Specifications from Office of Public Works, City Chambers.

Grimsby.—January 30th. Electricity Department. 500-kW traction converting plant, sub-station e.h.p. switchgear, e.h.p. feeder and pilot cables. (January 15th.)

Halifax.—February 20th. Markets and Parks Committee. Electrical engineering work in connection with the erection of the public abattoirs. Particulars from Borough Engineer, Crossley Street.

India.—March 8th. India Store Department. 40 electric freight locomotives in connection with the G. I. P. Railway electrification. (January 15th.)

February 5th. Punkah motors, a.c.

Kilmarnock.—Ayrshire Electricity Board. Supply, delivery and laying of h.p. cables and ducts in the Burghs of Ayr and Prestwick, also transformer kiosks and section pillars. (See this issue.)

Leeds.—February 1st. Board of Guardians. Supplying and laying underground l.p. cables at the Institution, Beckett Street. (See this issue.)

Liverpool.—January 28th. Electricity Department. Twelve months' supply of cables, meters, electrical sundries, electric lamps, &c. (January 15th.)

London.—E.C.—January 30th. Marryat & Place. 113,000 5-amp., 220-V tumbler switches. (January 8th.)

HAMMERSMITH.—February 10th. Electricity Department. Stores for 12 months, including electric light sundries, insulated wire, joint boxes, meters, l.p. cables, &c. (See this issue.)

ISLINGTON.—January 28th. St. Mary's Board of Guardians. Installation of electric lighting at Andover Row Schools. (January 15th.)

February 8th. Electricity Department. One 10,000-kW 3-phase turbo-alternator, condensing plant, condensate, circulating exhaust, steam and water pipes, &c. (See this issue.)

METROPOLITAN WATER BOARD.—February 8th. 12 months' supply of electric lamps. Forms of tender from the Chief Engineer, 173, Rosebery Avenue, E.C.1.

LONDON COUNTY COUNCIL.—January 25th. 4,425 tons of standard steel girder tramway track rails, fishplates and fishbolts, and about 600 tons of conductor rails. Specifications from the Chief Engineer, Old County Hall, Spring Gardens, S.W.

February 22nd. H.p. switchgear for Lewisham tramway sub-station. (See this issue.)

Manchester.—January 26th. Tramways Committee. Motors and trucks for electric tramcars. Specifications from Mr. H. Mattinson, general manager and chief engineer, 55, Piccadilly.

January 29th. Electricity Committee. Wiring for electric lighting and power circuits, offices, stores and workshops at the High Street depôt, Chorlton-on-Medlock. Specification from Mr. H. C. Lamb, manager, Electricity Department, Town Hall.

Newark-upon-Trent.—February 10th. Electricity Department. E.h.p., medium, and l.p. mains and distribution network, with street-lighting mains and accessories, single- and three-phase house-service pattern meters, two 250-kVA transformers, e.h.p., 11,000-V switchgear. (See this issue.)

New Zealand.—WELLINGTON.—March 8th. New Zealand Government Railways. Two 25-h.p. variable-speed motors, one 125-kW motor-generator set and 17 400-V, 3-pole switches.* Public Works Department. April 6th. Storage battery, motor generator, and switchboard for the Penrose sub-station. March 23rd. Five oil filters, 5 oil-testing equipments, and 5 filter-paper drying ovens.* 22,000-V switchgear and equipment for Penrose sub-station.*

Plymouth. — February 4th. Electricity Department. One 6,000-kW turbo-alternator, condenser, &c.; one 350-kW converter. (January 15th.)

Retford.—February 19th. East Retford Gas, Water and Electricity Department. Electricity generating plant, mains, transformers and meters. (See this issue.)

South Africa.—JOHANNESBURG.—February 25th. Municipal Council. Four d.c. switchgear panels and 3-phase truck-type ironclad switchgear panels.*

February 25th. S.A. Railways and Harbours. Two 4-ton electrically-driven fixed wharf cranes for Luderitz jetty.*

Tenterden (Kent).—January 27th. Board of Guardians. Electric lighting installation at the Institution. Master of the Institution.

Uruguay.—MONTEVIDEO.—February 26th. State Electricity Works. Diesel oil engine and a direct-coupled generator.*

Walthamstow.—January 27th. U.D.C. Electricity Department. Two water-tube boilers, mechanical stokers, economisers and pipework, &c. (January 8th.)

* Further particulars can be obtained at the Department of Overseas Trade (Inquiry Room), 35, Old Queen Street, S.W.1.

Closed.

Belgium.—The Belgian Post and Telegraph Department has placed an order with the Ateliers de Constructions Electriques de Charleroi for the manufacture, laying and jointing of 350 kilometres (about 218 miles) of special long-distance telephone cable for connecting Brussels with La Panne, Lille and Roosendaal, at a total cost of a little over £600,000.

Billericay.—Board of Guardians. Accepted:—
Electrical equipment of the Institution and the new hospital (£3,775).—Ellis & Ward.

Birkenhead.—Electricity Committee. Accepted:—
Six miles v.i.r. cable (£1,068).—Callender's Cable & Construction Co., Ltd.
Three miles single core cable (£1,057).—Macintosh Cable Co., Ltd.

Carlisle.—Electricity Committee. Accepted:—
Supplementary pipework at new generating station (£291).—Stirling Boiler Co., Ltd.

East Ham.—Electric Lighting Committee. Recommended :—
Transformer plant (£416).—Fuller's Electrical & Manufacturing Co.

Gravesend.—Electricity Committee. Recommended:—
Conveying plant alteration (£276), plus 2s. 9d. per hour for erectors' services.—Bennis & Co., Ltd.

Halifax.—
Electric vacuum plant for Town Hall cleaning purposes (£489).—Sturtevant Engineering Co., Ltd.

Irish Free State.—DUBLIN.—Dublin City Commissioners. Accepted :—
Electric wiring of 422 houses at Croydon Park area (£5,417, £12 16s. 9d. per house) with Continental wire.—Dublin Corporation Electricity Department.

Lamp Contracts.—The British Thomson-Houston Co., Ltd., has received a twelve-months' contract for the supply of "Mazda" lamps to the Great Southern Railway Co. (Ireland).

London. — ISLINGTON. — Electricity Committee. Recommended :—
Switchgear (£17,925).—Park Royal Engineering Works, Ltd.
3-phase transformers and regulators (£10,834).—C. A. Parsons & Co., Ltd.
75-kW motor-generator (£2,087).—Electric Construction Co., Ltd.

HAMMERSMITH.—Works, Cartage and Cemetery Committee. Accepted :—
Renewal of batteries for two electric dust vehicles, £182 each, less £27 each for old batteries returned.—Chloride Electrical Storage Co., Ltd.

Oldham.—Electricity Committee. Accepted:—
Cable.—Union Cable Co., Ltd.
A.c. recording voltmeters.—Erskine, Heap & Co., Ltd.
Supply and erection of superheaters at new generating station.—Babcock and Wilcox, Ltd.

South Shields.—Housing Committee. Accepted:—
Wiring Council houses (£6 12s, per non-parlour house, £7 5s. per parlour house).—Embleton & Barker.

Stafford.—Electricity Committee. Accepted:—
Cable in connection with the second 3,000-kW set (£550).—Callender's Cable & Construction Co., Ltd.

Weymouth.—Housing Committee. Accepted:—
Wiring houses on Westham housing estate (£280).—B. P. Darch.

Forthcoming Events.

Royal Institution.—Friday, January 22nd. At 21, Albemarle Street, W. At 9 p.m. Lecture on "The Work of the Davy-Faraday Research Laboratory," by Sir William Bragg.

Institution of Production Engineers.—Friday, January 22nd. At the Society of Motor Manufacturers, Ltd., 83, Pall Mall, S.W. At 7.30 p.m. Paper on "Features of Machine Tools which make for Increased Production," by Mr. G. W. Rawlings.

Physical Society of London.—Friday, January 22nd. At the Imperial College of Science, South Kensington, S.W. At 5 p.m. Ordinary scientific meeting.

Birmingham Electric Club.—Friday, January 22nd. At the Grand Hotel, Colmore Row. At 7 p.m. Presidential address.

Institution of Electrical Engineers.—Monday, January 25th. At the Institution, Victoria Embankment, W.C. At 7 p.m. Informal meeting. Discussion on "Impressions of My Visit to America, mainly about Switchgear," to be opened by Mr. H. M. Clothier.

(Mersey and North Wales (Liverpool) Centre).—Friday, January 29th. At the University Club, Liverpool. Annual dinner.

(North-Eastern Centre).—Monday, January 25th. At the Armstrong College, Newcastle-on-Tyne. At 7 p.m. Paper on "The Past, Present, and Future Developments of Wireless Telephony," by Capt. P. P. Eckersley.

(North-Midland Centre).—Tuesday, January 26th. At the Hotel Metropole, Leeds. At 7 p.m. Paper on "The Use of Induction Regulators in Feeder Circuits," by Mr. L. H. A. Carr.

(North-Western Centre).—Tuesday, January 26th. At the Midland Hotel, Manchester. Annual dinner.

(South-Midland Centre).—Wednesday, January 27th. At the University, Birmingham. At 7 p.m. Paper on "The Power Losses in Magnetic Sheet Material at High Flux Densities," by Mr. C. E. Webb.

(Western Centre).—Tuesday, January 26th. At the South Wales Institute of Engineers, Cardiff. At 6 p.m. Faraday Lecture on "Illumination and Light," by Mr. A. P. Trotter.

(London Students' Section).—Friday, January 22nd. At the Institution, Victoria Embankment. At 6.15 p.m. Paper on "Switchgear," by Mr. C. F. George.

(Scottish Students' Section).—Friday, January 22nd. At the Royal Technical College, Glasgow. At 7.30 p.m. Paper on "Economics and Engineering," by Mr. W. S. Cormack.

Institution of Civil Engineers.—Tuesday, January 26th. At Great George Street, S.W. At 6 p.m. Paper on "The Rugby Radio Station," by Mr. A. S. Angwin and Mr. T. Walmsley.

Electricity Supply Commercial Association (Greater London Division).—Tuesday, January 26th. At the Cannon Street Hotel. From 7.45 p.m. to 11.30 p.m. Dance.

Electrical Power Engineers' Association (Derby and District Section).—Wednesday, January 27th. At the Black Boy Hotel, Long Row, Nottingham. At 7 p.m. Lecture on "Boiler Plant Development in Association with Powdered Fuel," by Mr. F. H. Rosencrants.

Batti-Wallahs' Society.—Wednesday, January 27th. At the Hotel Cecil, Strand, W.C. At 1 p.m. Luncheon. Address by Sir Hugo Hirst, Bart.

Junior Institution of Engineers.—Friday, January 29th. At 39, Victoria Street, S.W. At 7.30 p.m. Paper on "Comfort in Railway Travel from the point of view of the Engineer," by Mr. A. N. Moon.

Institution of Welding Engineers.—Friday, January 29th. At the Philosophical Hall, Park Row, Leeds. At 7 p.m. Paper on "The Arc Welding of Seams in Steel Plates," by Mr. J. T. Carr.

The "Electrical Review" Service Department.

INQUIRIES must be accompanied by a stamped addressed envelope.

We should be glad to learn the names and addresses of makers of the following :—

CONVENIENT table standards.
WHIRLPOOL electric heaters.
YAVAN flexible cementing material.
COOLEX fuse boards.

Notes.

Bay of Fundy Hydro-Electric Scheme.—Some particulars are given in the *Electrical News* of a proposed scheme for the development of the tides of the Bay of Fundy for hydro-electric purposes. Two smaller bays, Passamaquoddy and Cabscook, are separated from the main portion by a number of islands. The suggestion is to generate power by keeping the two pools at separate elevations by means of a number of dams connecting the various islands, and allowing the ocean water to flow from the upper pool through a power house to the lower one. The level of the upper pool would be raised at each high tide by opening control gates at that time and that of the lower pool lowered at each ebb tide. There is a neutral phase when the tides would have no action on the pools and during this period the source of power would be from storages. As the fall between the pools was lessened the number of turbines in service would be increased. The storage area would be 150 square miles. It is estimated that the cost of the scheme would be $85,000,000, and that an average of 500,000 h.p. could be generated while the annual production would be about 3,000,000,000 kWh.

Fatality.—At an inquiry into the death of John W. Green, an electrical engineer employed by the Newcastle-on-Tyne Electric Supply Co., Ltd., at the Castner-Kellner sub-station at Wallsend, it was found that the deceased had died from burns accidentally received from an electric arc. This, the verdict stated, had been set up by his having opened feeder isolator bars, apparently not knowing, or having overlooked, that the pressure was on. Whether the deceased had had some temporary aberration or pre-occupation at the time, or had not been given a definite and correct message by the control engineer as to the position generally, the jury was unable to say.

Tramways and Light Railways Association.—The seventeenth annual congress of the Association will be held at Bristol on June 24th and 25th, 1926.

South African Association of Municipal Electrical Engineers.—The next convention of the Association, says the *South African Engineer*, is to take place in Johannesburg during the week April 12th to 17th next. Mr. B. Sankey, general manager of the gas and electricity undertaking of the Johannesburg municipality, is the president-elect, and it is anticipated that there will be a large gathering of municipal electrical engineers, together with their councillor delegates, from all over the Union.

The Government's Electricity Scheme.—Representatives of the electricity supply industry met on January 19th to discuss the Government's electricity scheme. No official statement in connection with the conference was issued, but the *Financial Times* states that the electrical manufacturers and supply authorities who have been consulted by the Ministry of Transport on certain details have few modifications to suggest, and are definitely in favour of the new legislation, not so much for the technical changes and improvements it will effect as for the prospects it offers of creating a sound home market for their products. The Government has no intention of embarking through the medium of a Power Board on immediate large capital expenditure, and investors who see in the new proposals an opportunity for immediately increased activity in the electrical manufacturing industry are certain to be disappointed. On the other hand, the removal of legislative obstruction will justify existing undertakings in embarking at once on constructive schemes. The benefit to the manufacturer will accrue from the increased activity of existing undertakings, rather than from the provision of capital stations owned by the central authority. The progressive supply authority, whether municipal or industrial power company, will benefit directly, since power as sold by it to the large industrial consumer is as cheap as any national system of power stations and main transmission lines could devise. The Board will deal with policy almost exclusively and the principal factors in administration, while the Electricity Commission will work out the technical, engineering and financial details. It is obvious that the new scheme depends wholly for success on this Board, and if it is unequal to the task, electrical development may be retarded, or even diverted into the wrong channels.

E.P.E.A. Peterborough Dispute.—The protracted negotiations between the Peterborough Corporation and the Electrical Power Engineers' Association have been settled. Following the Association's threat to withdraw its members' services, *The Times* reports that the Town Council has decided to reclassify the electricity undertaking into Class C and to pay the technical staff's salaries increases retrospectively from November, 1924.

Electricity Supply in Canada in 1924.—A preliminary report on the electricity generating station industry in Canada, published by the Dominion Bureau of Statistics, shows that a substantial increase took place during 1924. There was no change in the number of power plants, but transmission and distribution lines were extended in every province and service was supplied to 1,219 municipalities as against 1,146 in 1923. Many additions were made to existing power plants, especially in the hydraulic stations. Water wheels increased by 26 in number and by 425,410 h.p. in capacity; steam turbines and internal combustion engines also increased in both number and capacity, but reciprocating engines showed reductions, the net increase in primary power main plant equipment being 425,605 h.p. and in auxiliary equipment, 18,530 h.p. The increase in capital during the year was 8 per cent. Capital invested in hydraulic stations increased from $464,171,935 in 1923 to $507,116,143, or by 9 per cent., whereas the investment in fuel stations showed a slight decrease. Some of the larger additions made during the year were 120,000 h.p. by the St. Maurice Power Company, 22,600 h.p. by the Montreal Light, Heat and Power Company, 20,000 h.p. by the Quinze Power Company in Quebec, 136,000 h.p. in the Niagara plants, 6,600 h.p. in the Central Ontario system and 25,000 h.p. in the Cameron Falls plant of the Ontario Hydro-Electric Power Commission, and 12,500 h.p. by the Canadian Niagara Power Company in Ontario. In Manitoba, the Manitoba Power Company put into operation 56,000 h.p. and in British Columbia the East Kootenay Power Company added 15,000 h.p. to its Fernie plant. The net revenue of generating stations during the year showed an increase of $7,119,970, or 10.5 per cent. The number of customers also increased in all provinces. The increase in Quebec was 24,671, or 8.3 per cent.; in Ontario, 33,195, or 7 per cent., and in Manitoba, while the increase was not so large (16,760), it was at the rate of 22 per cent. The output was less than during 1923 in Nova Scotia, Saskatchewan, Alberta and in the Yukon, but the increases of 898,408,000 kWh in Quebec, 167,296,000 kWh in Ontario, 124,056,000 kWh in Manitoba, and 30,849,000 kWh in British Columbia, with smaller increases in the other provinces, produced a net increase of 1,216,089,000 kWh, or 15 per cent. The total output of fuel stations was less by 8,695,000 kWh, or 5.5 per cent., decreases being shown in all the provinces except Prince Edward Island, Ontario and British Columbia, where only small increases were made. The hydro-electric stations increased their production in every province. Although the fuel power plants are almost as numerous as the hydraulic plants, they play only a minor part in industry, generally as lighting plants in small municipalities, and their output was only 6 per cent. of the total.

National Research Endowment in the United States.—An official announcement quoted in *Science* states that the National Academy of Sciences has appealed to a body of prominent public men to join with leading scientists in an endeavour to secure larger resources for research in pure science. It is hoped that an annual income of at least two million dollars will be secured to establish National Reearch Professorships, and in other ways to co-operate with universities and other institutions throughout the country which are prepared to do their full share in the encouragement and support of fundamental research in the mathematical, physical and biological sciences. While the United States is in the forefront of industrial research, it is accomplishing much less in pure science than its population and material resources would lead one to expect.

The Academy has created a special board of trustees of the National Research Endowment. Mr. Herbert Hoover has been requested to act as chairman of the board and has accepted.

In discussing the vital need for greater financial support of pure science research, Mr. Hoover said in a recent address: "While we have in recent years developed our industrial research upon a scale hitherto unparalleled in history, we have by no means kept pace in the development of research in pure science. The sudden growth of industrial research laboratories has in itself endangered pure science research by drafting the personnel of pure science into their ranks. Thus applied science itself will dry up unless we maintain the sources of pure science. We must add to knowledge, both for the intellectual and spiritual satisfaction that comes from widening the range of human understanding, and for the direct practical utilisation of these fundamental discoveries. A special study in an industrial laboratory, resulting in the improvement of some machine or process, is of great value to the world. But the discovery of a law of Nature, applicable in thousands of instances and forming a permanent and ever available addition to knowledge, is a far greater advance."

Officials of the academy explain that the problem is to make academic posts so attractive that the ablest men will seek and hold them permanently because of the opportunties they offer to advance knowledge by fundamental research. This can be done by providing adequate salaries, freedom from too much teaching or administration, necessary instruments and apparatus, and skilled assistants to perform the extensive routine operations that scientific research involves. In short, able investigators should be given some such comfort in life, freedom of action, and opportunity for constructive thought as industrial and administrative officers, certainly of no larger calibre, habitually enjoy.

Appointments Vacant.—Relief engineer (£282), switchboard attendant (£282), three junior switchboard attendants (£245 and £195), three junior sub-station attendants (£165) for the Dublin Corporation Electricity Department. Shift charge engineer for the Borough of Warrington Electricity Department. Technical assistants in the Torpedos and Mining Department of the Admiralty (£400+). Electrical clerk of the works at Barking power station, for the County of London Electricity Supply Co., Ltd. Power station superintendent (£952), two charge engineers (£630) for the Municipal Commissioners of Singapore. (See our advertisement pages to-day.)

High-pressure Transmission in Germany.—This problem was discussed by various engineers at a conference of the Electrotechnical Association for the industrial region of Rhenish-Westphalia, held at Essen this month. Herr Weickert, of the Mannheim firm of Brown, Boveri & Co., dealing with high-pressure switching installations, stated that until a few years ago only a few main transmission lines in Germany were operated at 100,000 volts, whereas now the country was covered with a network of 100,000-volt lines, while the Rhenish-Westphalian Electricity Works Co. was constructing the first line at 220,000 volts, which was being erected in the direction of South Germany. It was held that a pressure of 380,000 volts would have to be employed if large power was to be transmitted across Germany. The electrical manufacturing industry in itself, he remarked, was prepared for such a high pressure, but it was a matter for the supply industry to investigate whether such a pressure could be economically employed in Germany. Discussing the question of high-pressure overhead insulators, Dr. Binder, of the Dresden Technical High School, stated that it was of special importance for the insulators to hold good not only in dry weather, but also under the many unfavourable working conditions represented by rain, snow, fog, and thunderstorms. At present insulator chains were used for the suspension and staying of the conductors in connection with the high pressures employed, consisting of an average of six links in the case of 100,000 volts. If in future recourse was had to the use of 220,000 volts as the working pressure, as was required by the great increase in the energy requirements, the result would be the employment of insulator chains of 12 links at the least and a length of over 2½ metres. But as a result of the employment of wire guards or protection trays at the end of the chain, it had been possible to bring about almost a uniform distribution of the pressure and divert arcs from the chain. In conclusion, the professor remarked that it was possible to look forward with complete confidence to the development of installations at 220,000 volts, seeing that one German firm stated that its latest tramway insulators had a breaking strain of 18 tons.

B.E.S.A. Publication.—The British Engineering Standards Association has just issued a glossary of terms used in illumination and photometry which it has prepared for the assistance of all interested in the subject. The terms have been approved by the National Illumination Committee of

Great Britain and are in accordance with the decisions of the International Illumination Commission so far as such decisions are applicable. The glossary covers a wide range of terms and where there are two terms in use for the same definition, the preferred term is given in heavy type and the synonym in lighter type. Copies of the new publication, No. 233—1925, can be obtained from the B.E.S.A. Publications Department, 28, Victoria Street, London, S.W.1, price 1s. 2d. each, post free.

Engineering Conference in Australia.—The Engineering Conference which was to have been held at the beginning of 1925, is now to take place at Hobart from February 15th to 19th, 1926. An interesting programme has been arranged and in addition to social functions, visits to works and places of interest, &c., the following will be amongst the papers that will be presented during the conference: "Notes on the Development of the Power Resources of Tasmania," by J. H. Butters; "The Commercial Use of Electric Vehicles," by H. A. Child; and "The Construction of a Multiple Arch Dam at Miena," by A. H. Bastow.

The Rural Reconstruction Committee.—A conference has been arranged by the Rural Reconstruction Committee to take place at Denison House, Vauxhall Bridge Road, S.W.1, on January 23rd, to consider what steps should be taken to place its policy before the nation. The chair will be taken by Dr. Gilbert Slater, and the conference will be opened by Mr. Montague Fordham, who will deal with the agricultural problem. Mr. R. Borlase Matthews will deal with the question from the point of view of the applications of electricity to agriculture and rural industries. It is interesting to note that the promoters of this movement realise the importance of an electrical supply in the carrying out of any scheme intended to divert dwellers in towns to rural areas and to prevent the depopulation of the countryside.

Engineer Officers in the Navy.—The First Lord of the Admiralty last week granted an interview to representatives of the engineering institutions, who lodged a protest against the recent Admiralty Fleet Order affecting the status of engineer officers in the Navy. The bodies represented were: The Institutions of Civil, Mechanical, and Electrical Engineers, Naval Architects, and the North-East Coast Institution of Engineers and Shipbuilders, representing an aggregate membership of about 36,000 professional engineers.

Institution Notes.

Institution of Electrical Engineers.—PROGRAMME.—The arrangements for the second half of the session include papers by Messrs. E. V. Clark, on "Power Factor and Tariff," and E. W. Dorey, on "Power Factor Improvement" (February 4th); M. Parodi, on "The Electrification of the Paris-Orleans Railway" (February 18th); R. B. Matthews on "Electro-farming" (March 4th); and L. C. Grant, on "Developments in High-Power Fuses" (March 18th). The annual dinner will be held on February 11th, and the 17th Kelvin lecture will be delivered by Sir J. J. Thomson, O.M., F.R.S., on "The Mechanics of the Electric Field," on April 22nd.

WIRELESS SECTION.—On February 3rd Mr. J. Hollingworth will read a paper on "The Propagation of Electric Waves". on March 3rd, Mr. R. A. Watson Watt will deal with "The Directional Recording of Atmospherics"; and on April 14th, Mr. E. H. Shaughnessy, O.B.E., will describe "The Rugby Radio Telegraphy Station."

INFORMAL MEETINGS.—Discussions will be opened by the following members: Mr. H. W. Clothier, on "A Visit to America —Mainly about Switchgear" (January 25th); Mr. R. J. Mitchell, on "Ball and Roller Bearings" (February 8th); Mr. A. F. Harmer, on "The Application of Electricity to Public Supply" (February 22nd); Mr. F. Creedy, on "A Recent Development in A.C. Apparatus" (March 8th); Mr. G. Rogers, on "The Performance of Mercury-arc Rectifiers" (March 22nd); and Captain P. P. Eckersley, on "Linking together Wireless and Wire Communication Systems" (April 12th).

At the informal meeting which was held at University College, Gower Street, on Monday, January 11th, Mr. W. C. Clinton, B.Sc., supported by Mr. A. G. Hilling as chairman, opened a discussion on "The Electrical Equipment at the Rockefeller Building," which houses the Department of Anatomy, &c., and the Research Laboratories. The installation of electric lighting and power for which a supply is taken from the St. Pancras Borough Council's mains at 220 and 440 volts d.c., is not particularly notable, except for thoroughness and a prolific use of two-way switching, but much of the laboratory apparatus excited very great interest. In the Main Lecture Theatre Mr. Clinton read his paper describing the installation, and detailed with numerous schedules of efficiencies the items of lighting and power equipment. His tables of figures were thrown on a screen by means of the Epidiascope, which projects in natural colours images of prints, books, or any object not too large to be placed in the reflection chamber. The audience then made a tour of the building to inspect the various equipments, which were described by specialists in attendance. On re-assembling in the Lecture Theatre, tributes and minor criticisms were made by Messrs. G. C. Allingham, J. R. Bedford, H. Freeman, A. G. Hilling, C. Lipman, W. E. Rogers, and H. T. Young.

NORTH-WESTERN CENTRE.—Papers will be read on the following dates: February 2nd, by Messrs. E. V. Clark and E. W. Dorey; February 16th, Mr. E. H. Shaughnessy; March 2nd, Messrs. J. L. Thompson and H. Walmsley; March 16th, Mr. L. C. Grant; March 30th, Mr. R. B. Matthews.

WESTERN CENTRE.—Papers will be read on the following dates: January 26th, by Mr. A. P. Trotter (Faraday Lecture); February 1st; March 1st, Mr. T. Carter; April 12th, Mr. R. B. Matthews; May 3rd, Prof. S. Parker Smith.

Our Personal Column.

(Electrical men are invited to enable us to keep readers of the "Electrical Review" posted concerning their movements).

Readers of the ELECTRICAL REVIEW will learn with regret that Mr. LEONARD G. TATE, secretary of the Electrical Contractors' Association, has to undergo an operation to-morrow (Saturday). He has been unwell for some time, and was unable to be present at the annual dinner of the Association on Tuesday last. Mr. Tate will have the best wishes of a host of friends in the electrical world for a speedy recovery to perfect health.

Sir MAX MUSPRATT, Bart, J.P., the president-elect of the F.B.I. in succession to Col. F. V. Willey, is one of the leading figures in the chemical industry and chairman of the United Alkali Co., Ltd. He was born in Liverpool in 1872 and was educated at Clifton College and at Zurich, entering in 1895 the works of the company of which he is now chairman. In 1901 he became a director on the technical side of the business and succeeded his father in the chairmanship in 1914. Sir Max is not only well known as a business man in the chemical world; he is also himself a chemist of great ability

Lafayette] *[London.*

Sir Max Muspratt, Bart., J.P.,
The President-Elect of the F.B.I.

and is the first Englishman to hold the Diploma in Industrial Chemistry awarded by the Swiss Government. In addition to the chairmanship of his own business, he is the vice-president of the Association of British Chemical Manufacturers; deputy chairman of the Sulphuric Acid Association; chairman of the recently-appointed Lord Mayor of Liverpool's Committee on Trade and Industry of the Port of Liverpool; and chairman of the Liverpool Economic League. He has taken a very active part in politics and was Liberal M.P. for the Exchange Division of Liverpool in 1910. In 1917 he was Lord Mayor of Liverpool, and since entering the City Council in 1903 has been at one time or another connected with almost every municipal activity in that city.

Mr. W. J. PARKER, chief storekeeper of the Raw Stores at the Marconi Company's works at Chelmsford, who is leaving after 26 years' service, has been presented by the staff with an inscribed gold watch.

Mr. H. STONE, of the Urban Electric Supply Co., Dartmouth, has taken up the appointment of assistant electrical engineer to the Lyme Regis Borough Council.

Mr. A. L. C. FELL, who retired from the position of general manager of the London County Council Tramways last year, is to marry Miss FLORENCE WYNN, of Redcar, next month.

SIR CHARLES BRIGHT, F.R.S.E., &c., has accepted the presidency, and SIR WILLIAM S. GLYN-JONES the vice-presidency, of the Wireless Retailers' Association.

Fulham Borough Council Electricity Committee recommends that the borough electrical engineer, Mr. ARTHUR J. FULLER, be granted three months' leave of absence from duty on full pay, to enable him to recuperate and regain his normal health, and that he be paid a sum of £250 as an honorarium towards the expenses of his enforced holiday, and as a mark of the Council's appreciation of the special services rendered by him to the Fulham electricity undertaking in connection with capital extensions, and otherwise, for many years past.

Bacup Town Council has increased the salary of the borough electrical engineer from £500 to £550 per annum.

Mr. P. V. HUNTER, who contributes an article which appears elsewhere in this issue, is the chairman of the Executive Committee of the National Register of Electrical Installation Contractors and is joint manager of Callender's Cable & Construction Co., Ltd. He was born in Norfolk in 1883 and was a student at Faraday House, after which he became associated with Messrs. Willans & Robinson, the Great Yarmouth Electricity and Tramways Department, and the Willesden Urban District Council. In 1903 he joined the consulting engineering firm of Messrs. Robert Hammond & Son as assistant engineer, and from 1904 to 1916 he was with Messrs. Merz & McLellan, being appointed chief of their electrical department in 1909. While he was with this firm he was associated with the building of the Carville and other important power stations and with the electrification of railways in Argentina and elsewhere. During 1916 and 1917 he was engaged in consultative work in connection with the electrical equipment of the armies in the field, and from December, 1917, until the end of the war he was attached to the naval staff as chief engineer to the experimental and research section of the Anti-Submarine Division. For his war services he was awarded the C.B.E. A full member of the Institution of Electrical Engineers, Mr.

Elliott & Fry] *[London.*

Mr. P. V. Hunter, C.B.E.,

Chairman of the Executive Committee of the N.R.E.I.C.

Hunter is a member of its Council and a past chairman of the North-Eastern Centre. He has been an active member of various committees of the British Engineering Standards Association, the British Electrical and Allied Industries Research Association, and the International Electro-technical Commission. He invented the split conductor protective system, the repellent arc switch in which the repelling effect of two arcs, which are electrically in series but physically in parallel, is employed to increase the rupturing capacity of the switch, and the four-conductor system of three-phase cable protection. During the autumn of last year Mr. Hunter visited America principally in connection with the establishment of the Okonite-Callender Cable Co., a company which, as the name indicates, has been jointly formed by Callender's Cable and Construction Co. and the Okonite Co. of America. The joint company has established a factory at Paterson, New Jersey, for the manufacture of paper-insulated cables, and particularly for exploiting in the United States the special methods which Callender's have developed of manufacturing extra-high-pressure cables.

Mr. J. PICTON BAGGE, British Commercial Secretary at Brussels, is to attend at the Department of Overseas Trade from to-day (Friday) to January 29th. United Kingdom manufacturers and merchants interested in trade with Belgium can obtain interviews by appointment, quoting reference 16,056.

When the British Empire Producers' Organisation meets at luncheon at the Mansion House on February 3rd to celebrate its tenth anniversary, it will present the Rt. Hon. L. S. AMERY, M.P., Secretary of State for Dominion Affairs and the Colonies, with his portrait painted by Sir Luke Fildes, K.C.V.O., R.A.

Mr. J. T. WHITELAW, district manager of the Post Office telephones in the Blackburn area, has been appointed to a similar position at Manchester. He entered the telephone service in 1893.

The Kingston-on-Thames Town Council is recommended to increase the salary of the borough electrical engineer (Mr. KINGHAM) by £150 a year.

The *Daily Telegraph* correspondent at Sydney understands that Mr. PERCY HUNTER has definitely accepted the offer of the general managership of the Pacific Cable Board, which is subject to ratification at the next meeting of the board.

Obituary.—MR. A. L. COTTAM.—The death occurred on January 5th, at Redland, at the age of 71 years, of Mr. Arthur Lawrence Cottam, who carried on business as an electrical and engineering merchant and factor at Bristol. Among those present at the funeral on January 9th were representatives of a number of well-known electrical concerns (Messrs. Johnson & Phillips, Ltd., Callender's Cable & Construction Co., Ltd., the British Thomson-Houston Co., Ltd., Philips' Lamps, Ltd., Swedish General Electric, Ltd., and Messrs. Drake & Gorham Wholesale, Ltd.) and Mr. A. H. Dawson, chief electrical engineer to Messrs. W. D. & H. O. Wills, Ltd.

MR. G. D. ATKIN.—We regret to record that Mr. George Duckworth Atkin, a highly-esteemed member of the Stock Exchange who had for many years been prominently connected with the Electric Lighting share market, passed away suddenly on arrival at his office in Drapers' Gardens, E.C., on the severely cold morning of January 14th. Mr. Atkin, who was 66 years of age, was, through his firm, the issuer of the *Atkins Manual*, which is devoted to electricity supply securities, and has been occasionally mentioned in our "Stocks and Shares" article.

VISCOUNT CHILSTON.—The death has occurred, in his 75th year, of Viscount Chilston, of Chilston Park, Maidstone. He was chairman of the Midland Counties Electric Supply Co., Ltd., and of the Tramways, Light and Power Co., Ltd., a director of the South-Eastern & Chatham Construction and Power Co., Ltd., and a vice-president of the Tramways and Light Railways Association.

Will.—The late Mr. WILLIAM BAYLISS, chairman of Bayliss, Jones & Bayliss, left £68,310 gross and £54,320 net personalty.

New Companies Registered.

Modern Radio, Ltd. (211,082).—Private company. Registered January 13th. Capital, £1,000 in £1 shares. Objects:—To carry on the business of manufacturers, importers, exporters, and repairers of, agents for, and dealers in instruments, apparatus, and materials capable of being used in connection with radio telegraphy and telephony, in particular cables, wires, rope or other substances, accumulators, batteries, detectors, tuning switches, induction coils, condensers, headphones, thermionic valves, valve panels and receivers, amplifiers, aerial and other insulators, &c. The provisional directors are:—H. R. Smallwood, "Annacur," Gateshead, wireless engineer; R. H. Smallwood, "Annacur," Gateshead, general medical practitioner. Solicitor: C. F. Bolam, 12, West Street, Gateshead.

Bennett & Fountain, Ltd. (211,071).—Private company. Registered January 13th. Capital, £3,000 in £1 shares. Objects:—To acquire the business of wholesale, electrical and wireless suppliers now carried on by E. T. Fountain and A. E. Bennett at 6, Mortimer Street, W.1, as "Bennett & Fountain." The permanent directors are:—A. E. Bennett, 21b, Belmont Park, S.E.13; E. T. Fountain, 172, Willifield Way, Golder's Green, N.W.11. Qualification, 10 shares. Secretary: A. H. Wilson. Registered office: 6, Mortimer Street, W.1.

Strand & Interchangeable Signs, Ltd. (211,066).—Private company. Registered January 13th. Capital, £2,500 in 2,000 ordinary shares of £1 and 2,000 founders' shares of 5s. Objects:—To acquire and take over as going concerns (*a*) the goodwill of that part of the business of the Strand Electric and Engineering Co., Ltd., which relates to electric signs, and (*b*) the goodwill of the whole of the business of Interchangeable Electric Signs, Ltd. The directors are:—G. Harvey, M.P., J.P., 176, Cromwell Road, S.W.5 (chairman of Connaught Rooms, Ltd., and Burlington Hotels, Ltd.); A. T. Earnshaw, 50, Verdant Lane, Hither Green, S.E.6, electrical engineer; P. G. A. Harvey, 16, Rosary Gardens, S.W.7, underwriting member of Lloyds (director of Connaught Rooms, Ltd.); M. Mansell, 41, Morley Road, East Twickenham, electrical engineer; P. Sheridan, 151, Culverley Road, Catford, S.E.6, electrical engineer (all permanent). Secretary: H. W. Myers. Registered office: 24, Floral Street, W.C.2.

Bath Electrics, Ltd. (211,070).—Private company. Registered January 13th. Capital, £750 in £1 shares. Objects:—To carry on the business of factors and retailers of wireless and electrical goods and apparatus, electricians, mechanical engineers, &c. The directors are:—A. W. Young, Warwick Villa, Kennington Road, Bath, wireless and electrical engineer (managing director); Mrs. E. H. Young, same address; G. Young, 12, Foxcombe Road, Bath, manufacturer's chemist. Solicitors: Stone, King and Wardle, Bath. Registered office: Foxcombe Road, Bath.

Wireless Stores (Payne & Hornsby), Ltd. (7,452).—Private company. Registered in Dublin January 11th. Capital, £100 in £1 shares. Objects:—To acquire the business of radio engineers and wireless assemblers carried on by T. Payne and G. Hornsby at 34, Bachelors Walk, Dublin. The first directors are:—T. Payne, "The Laurels," Woodlands Estate, North Gosforth, Newcastle-on-Tyne; G. Hornsby, 2, Sydenham Terrace, South Shields, Co. Durham, radio engineer. Registered office not stated.

Hertz Radio Corporation, Ltd. (210,958).—Private company. Registered January 7th. Capital, £100 in 2,000 shares of 1s. each. Objects:—To acquire the trade name of the "Hertz Radio Corporation," to carry on business as manufacturers of, and dealers in wireless telegraphy and telephony instruments and component parts thereof, &c. The subscribers (each with one share) are:—H. L. Ledbury-Moore, 62, St. Benedict's Road, Small Heath, Birmingham, accountant; Lily Cantrill, 7, Gladstone Road, Yardley, Birmingham, secretary. The first directors are to be appointed by the subscribers. Qualification, 10 shares. Secretary: H. Oram, 55, Newhall Street, Birmingham.

Official Returns of Electrical Companies.

St. Austell and District Electric Lighting and Power Co., Ltd.—First mortgage debenture dated December 31st, 1925, to secure £20,000, constituting a first fixed charge on freehold and leasehold hereditaments at St. Austell and Luxulyan, rights of way, &c., and a floating charge on the company's undertaking and property, present and future, including uncalled capital. Holder: Solicitor for H.M. Treasury.

Cutting Bros. & Co., Ltd.—Particulars filed of £10,000 debentures authorised December 18th, 1925, charged on the company's undertaking and property, present and future, including uncalled capital, the whole amount being now issued.

Altrincham Electric Supply, Ltd.—Mortgage on land and premises, No. 60, Stamford New Road, Altrincham, Cheshire, dated December 23rd, 1925, to secure £6,250. Holders: National Provincial Bank, Ltd., 15, Bishopsgate, E.C.

G. W. M. Electrical Co., Ltd.—Particulars filed of £400 debentures authorised December 24th, 1925, charged on the company's undertaking and property, present and future, including uncalled capital, the whole amount being now issued.

Stratford-on-Avon Electricity Co., Ltd.—Particulars filed of £10,000 debentures authorised December 18th, 1925, charged on the company's undertaking and property, including uncalled capital, the whole amount being now issued.

Wireless Novelties, Ltd.—Satisfaction in full on November 23rd of debenture dated February 24th, 1925, securing £1,000.

Fryer & Hartley, Ltd.—Satisfaction is full on December 31st of mortgage or charge dated April 7th, 1925, securing £200.

City Notes.

Reports and Meetings of Electrical Companies, Dividend Results, &c.

Belgian Company.—The *Compagnie Centrale de l'Industrie Electrique*, of Brussels, which has an ordinary share capital of 4,000,000 fr., reports profits of 311,000 fr. for 1924-25. After writing off 300,000 fr. for depreciation, the balance is being carried forward. At the recent meeting it was stated that the company, together with a financial group, was participating in an increase in the share capital of the Compagnie d'Electricité de Sofia for the purpose of establishing a new Bulgarian station of 1,800-kW capacity.

Greenwood & Batley, Ltd.—An interim dividend of 2½ per cent. has been declared, as in 1925.

German Companies.—The *South German Telephone Apparatus, Cable and Wire Works Company*, of Nuremberg, after having written off 135,000 marks for depreciation, reports net profits of 280,000 marks for 1924-25.

The *Lloyd Dynamo Works Company*, of Bremen, proposes to reduce its share capital and to apply the book profits of 125,000 marks to depreciation and the covering of a possible loss for 1925. The capital will then amount to 2,150,000 marks, mainly in ordinary shares.

German Loan in America.—ELECTRICITY LOAN.—The Saxe-Anhalt Electric Works has concluded an agreement with Messrs. F. J. Lismann and Co., New York, for the issue of a loan of $1,000,000. The loan will be for a period of two years, and will bear interest at the rate of 6½ per cent.—*Financial News.*

Anglo-American Telegraph Co., Ltd.—The following final dividends are being paid:—Ordinary consolidated stock, £1 10s. per cent., less tax at 4s. 0¾d. in the £, making £3 15s. per cent. for the year; preferred stock, £1 10s. per cent., less tax at 4s. in the £, making £6 per cent.; and deferred stock, £1 10s. per cent., less tax at 4s. 1½d. in the £ (first and final). All the dividends are the same as were paid for 1924.

Vulcanite, Ltd.—A report made up to October 31st last states that foreign competition has reduced the output of the fibre mill. The net profit was £1,232 and the amount brought forward £2,246. After allowing for taxation £2,486 is to be carried forward.

Brazilian Traction, Light and Power Co., Ltd.—A quarterly dividend of 1¼ per cent. has been declared on the ordinary shares. Three quarterly dividends of 1 per cent. have been paid previously.

Tata Companies.—It is reported that the Tata Hydraulic Power Co. has raised a loan of two crores of rupees, part of which (85 lakhs) is to be devoted to the redemption of the company's debentures, while the balance (115 lakhs) is to be used to finance the Tata Power Co.

Traction and Power Securities.—Final dividends of 2½ per cent. on the preference stock and 9 per cent. on the ordinary stock are recommended. The past year's dividend on the ordinary stock is thus 13 per cent., as compared with 11 per cent. for the preceding year.

Reduction of Capital.—VICKERS, LTD. AND REDUCED.—A petition for the reduction of the capital of this company from £26,500,000 to £18,289,678 has been presented to the High Court, and will be heard in London on January 26th.

Stock Exchange Notice.—The undermentioned securities have been ordered to be officially quoted:—

Melbourne and Metropolitan Tramways Board.—Stock and partly-paid scrip for £300,000 5 per cent. stock, 1944.

Shanghai Electric Construction Co., Ltd.—The directors have declared a second interim dividend at the rate of 3 per cent. actual, less tax, in respect of the past year.

Herbert Morris, Ltd.—The dividends for the half-year ending January 31st have been declared on the cumulative preference shares.

Northern Mexico Power and Development Co.—The preference shares are to receive a dividend of 7 per cent. for the past year.

Edmundson's Electricity Corporation, Ltd.—An interim dividend of 3 per cent., actual, has been declared, as in 1925.

Stocks and Shares.

MONDAY EVENING.

THE Government's proposals for a great expansion of electrical distribution have been discussed with interest in the Stock Exchange, and have had a favourable effect upon prices of shares in those companies deemed likely to benefit if the scheme should become operative. The plan is welcomed as a long-overdue contribution to national well-being, but details are awaited while members of the Stock Exchange, who have little belief in the official capacity for running a business organisation, prefer to reserve considered opinions.

The first practical effect has been to put up prices of manufacturing companies' shares. Sharp rises have occurred in British Insulated, Enfield Cable, and Henleys. General Electrics are better at 30s. Electric Constructions and English Electrics have advanced. India Rubbers spurted to 24s. Aron Electricity Meters strengthened to 21s. 3d. It is thought that some of the engineering firms will be advantaged: Babcock and Wilcox are materially stronger at 54s. 6d. bid. The market argument is that any extensive development of electrical work is bound to be beneficial to the undertakings which deal in equipment. There is a shade of doubt as to whether the new arrangement will attract fresh business to the present supply companies.

The balance of price movements lies, however, in favour of shareholders. St. James' and Pall Mall ordinary are 5s. up, at 16; Kensingtons are equally better at 13¾. Bromptons rose to 35s. Several of the provincial issues are good, notably Bournemouths, which at 3⅛ show a 3s. gain. Smaller improvements have been secured by Clyde Valley, Newcastle-on-Tyne, and Yorkshires. Urban ordinary put on 1s. 9d., and are now 20s. Westminsters and County ordinary proved exceptions to the general tendency, being 1/16th easier at 2 7/16ths and 59/6 respectively. The Government's proposals have drawn fresh attention to the various sections of the electricity market, and have served to stimulate business. They have proved useful as a set-off to the talk of a possible national crisis in April or May if the coal industry should push matters to extremes. This last consideration is responsible for a good deal of quiet uneasiness in the mind of investment, and comes inopportunely at a time when markets are depressed by fears of dearer money and disturbed by a widely-spread reaction in rubber shares after their boom.

The Home Railway market is worried by the coal outlook, and most of the prices are lower, the Undergrounds dipping with the rest. London Traction stocks are unaffected. British Electric Tractions maintain their strength. A drop in Brazilian Tractions was recovered, and the remainder of the group has barely moved.

Cable stocks keep steady. Any stock which comes to market is absorbed without difficulty. Great Northerns, ex their dividend, are better at 32, making allowance for the deduction. The wireless department is passive. Canadian Marconis at 4s. 10½d. are the turn better. In the cable manufacturing section, the difficulty is to buy shares, so meagre is the floating supply and so tightly held by investors is the balance.

Rubber shares have come back in sympathy with a drop from 4s. 6d. per lb., to 3s. 1d. per lb. in the price of the raw material. The fall in values has uncovered—to use the Americanism—a bull account which is proving a source of weakness to the market. Evidence shows, now, that the speculator too often helped himself to 5,000 shares when 500 would have been a more discreet number for him to handle. Other markets are affected by the necessity for raising funds, by sales of various stocks and shares, to pay for rubber commitments. Hence a general dullness round the Stock Exchange and a mere bleating of business instead of a lusty roar of activity.

The funeral took place on Tuesday in this week, of the late Mr. George Duckworth Atkin, to whose enterprise and courage the electricity supply market owes no small part of its popularity to-day. He was amongst the first of the Stock Exchange men who realised, years ago, the tremendous part which electricity would play in the life of the community. He started to deal in the shares of the various companies, and founded a business which is now one of the most important in the Stock Exchange. Mr. G. D. Atkin was the best-known man in the House, and his sudden death in his office, on a bitterly bleak morning, came as a blow to his fellow-members, amongst whom he enjoyed a unique measure of popularity. His death is a loss to the electrical industry, as well as to his hosts of friends. Upon his memory there may be fittingly laid the tender tribute of farewell: *Placide requiescat.*

Proposed Electricity Supply to Sicily.—According to the *Electrical World* a scheme is at present under consideration to supply electricity to the island of Sicily from the hydro-electric power station in Calabria, the southern province of Italy. Three plans for transmission at 130,000 volts across the Straits of Messina, which at the narrowest point are 2.15 miles wide, have been prepared. The first provides for an overhead line, supported at each end on steel towers, 993 ft. high. It is estimated that there would be a sag of 770 ft. from the horizontal in the centre of the line. The second scheme provides for the construction of two 656-ft. shafts and a 2⅜-mile tunnel beneath the Straits at a distance of 378 ft. below sea level. The third scheme proposes a new type of submarine cable, made by Pirelli's. This cable, although laid on the bed of the sea, would, it is claimed, be capable of successfully transmitting the necessary electrical energy.

Proposed Duty on Imported Electricity.—A Swiss correspondent informs us that the rumour that Italy is going to tax imported electrical energy is causing a certain anxiety in Switzerland. For some years it has been a very important "article" of exportation from Switzerland, the power provided for Italy during last year being about 76,000 kW. Several power stations have been set up specially with a view to exporting electricity to Italy, and if the latter country taxes Swiss energy, the suppliers will be faced with unexpected difficulties. It is said that the proposed tax will be 30 per cent. of the wholesale price of the electricity, which is considered excessive in electrical circles, but as the Italians are determined, so far as lies in their power, to protect Italy, it is quite probable that the new duty will be as high as the figure mentioned.

Exports and Imports of Electrical Goods and Machinery in December, 1925.

Two Years' Figures Compared.

THE Board of Trade Returns for December mark the close of another year, and we are therefore enabled to give, in addition to our monthly table, a comparison of the individual items for the years 1924 and 1925. To illustrate further the course of trade, we have also prepared a number of curves relating to the principal items of export and import.

A study of the December figures reveals a fairly satisfactory increase in the export section, an increase which was well distributed over the items. The most important rises occurred in the cases of unenumerated electrical machinery, "other motors and generators," and submarine telegraph and telephone cable; the last item sprang up by over £57,000, and it is perhaps worthy of mention that this item fluctuated during 1925 between the upper and lower limits of £442 and £424,913, greatly influencing each month's figures. The only decrease of importance during December was the fall of £21,000 in the exports of glow lamps. Comparing the figures with those for December, 1924, it will be seen that, although there were one or two serious decreases, generally the increases predominated, and the net result was an increase of £70,226.

There was also an increase in the import section as compared with November, 1925, rises in unenumerated goods, apparatus and machinery, and cables more than compensating for a drop of £50,786 in batteries and accumulators. Comparing the figures with those for December, 1924, there was a decrease of £36,683, due mainly to a fall of £63,537 in telegraph and telephone instruments and apparatus, and one in batteries and accumulators, which were not counterbalanced by the rises in cables and unenumerated goods. The re-export section does not present much of interest, but it may be pointed out that there was a general rise as compared with the preceding month, and only two decreases of any importance.

Turning to the yearly figures, it will be seen that unenumerated electrical machinery reached the first place during 1925, although the exports of telegraph and telephone apparatus, which were the chief items in 1924, continued to grow. The greatest jump was made by submarine telegraph and telephone cable, and here it may be pointed out that the total given for 1924 shows a considerable difference from that given in the December, 1924, returns. This discrepancy, which amounts to about £500,000, is apparently due to the inclusion of a large item or some large items which were for some reason not available until after the close of the year. Important increases occurred in several other items, for instance, batteries and

Totals	£17,350,625	£16,034,038	+ £1,316,587	£5,355,549	£4,444,368	+ £911,181	£290,779	£248,228	+ £42,551

accumulators (£230,963), telegraph and telephone apparatus (£172,189), glow lamps (£169,258), and insulated wires and cables (£157,966). There was a large decrease in non-submarine telegraph and telephone cables, and the exports of "other motors and generators" and meters and instruments also declined to a considerable extent.

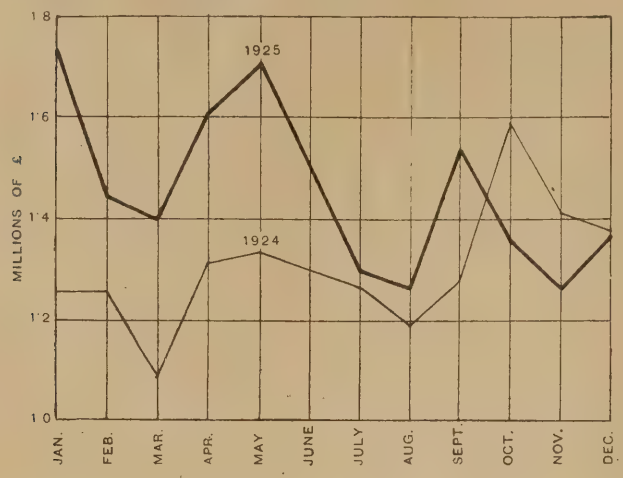

Fig. 1.—Monthly Exports During 1924 and 1925.

In the import section there were only two decreases as compared with 1924—in carbons and in telegraph and telephone apparatus. In the case of the latter, this was accompanied, as has been shown, by an appreciable increase in exports, as well as in re-exports. The growth of the radio industry is

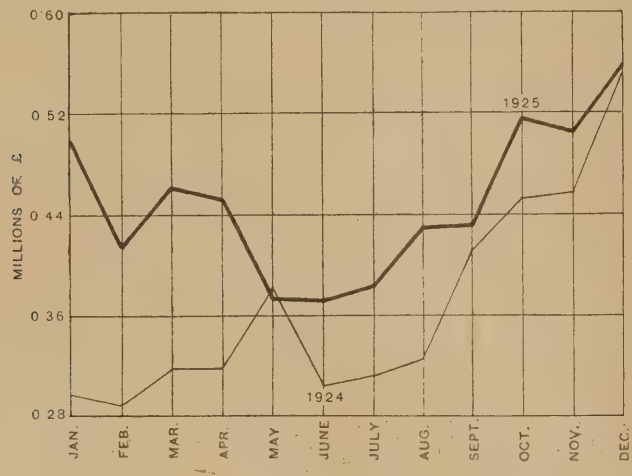

Fig. 2.—Monthly Imports During 1924 and 1925.

no doubt indicated by the rise of £260,349 in the imports of batteries and accumulators, and improved lighting may account for the rise of £211,065 in glow lamp imports. Other notable increases occurred in imports of unenumerated electrical goods, insulated wires and cables, and meters and instruments. The

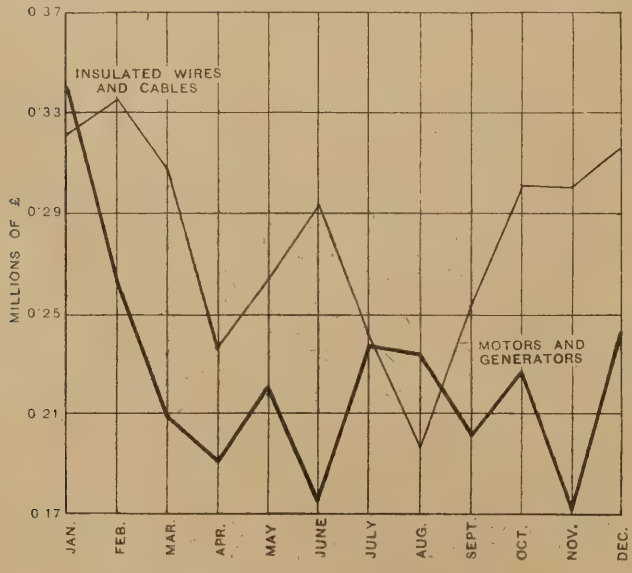

Fig. 3.—Exports of Cables and Motors and Generators.

re-export list shows principally increases resulting in a net rise of £42,551.

The curves are practically self-explanatory. The first (fig. 1) shows that exports remained above those of 1924, month by month, until October, but they practically regained the 1924 level by the end of the year. Fig. 2 compares the monthly imports during 1924 and 1925, and it is seen that, except for the drop in May, the figures remained above those for 1924 throughout the year. Fig. 3 shows the monthly exports of two outstanding items. For convenience the items "railway and tramway motors" and "other motors and generators" have been combined, and the curve relating to insulated wires

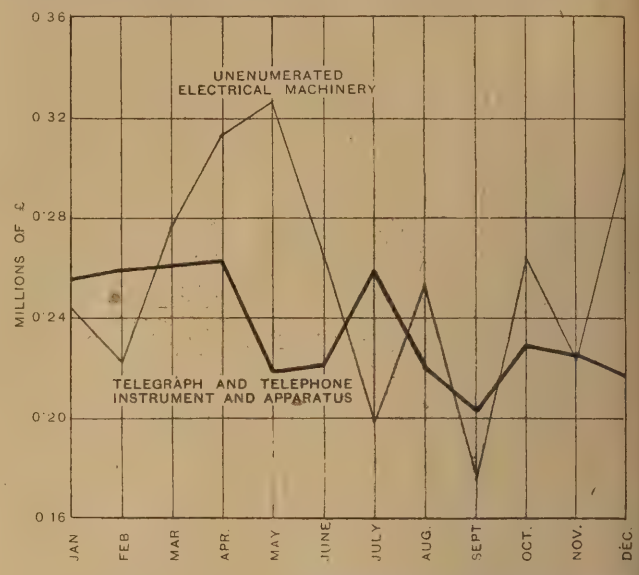

Fig. 4.—Exports of Machinery and Telegraph and Telephone Apparatus.

and cables includes non-submarine telegraph and telephone cables. Two other leading export items are illustrated in fig. 4, telegraph and telephone instruments and apparatus and unenumerated electrical machinery. The item fifth in im-

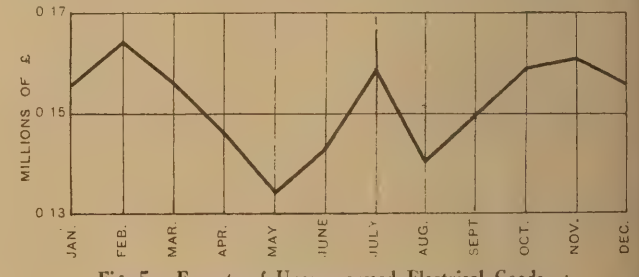

Fig. 5.—Exports of Unenumerated Electrical Goods.

portance in the export section is depicted in fig. 5. A larger scale is used which exaggerates the fluctuations, although unenumerated electrical goods was the item with the smallest variations. Fig. 6 presents curves of the three principal

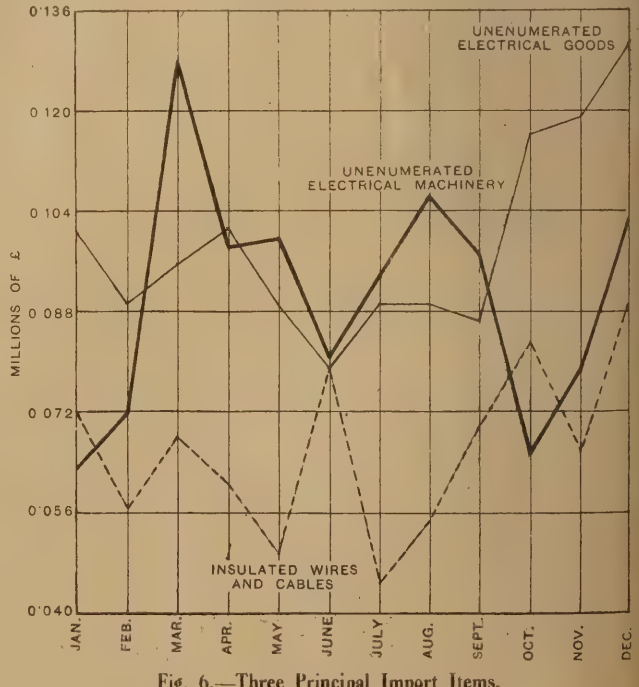

Fig. 6.—Three Principal Import Items.

import items, and again the curve of insulated wires and cables includes non-submarine telegraph and telephone cables.

It is satisfactory to note that although exports during 1925, as a whole, decreased from £800,967,000 to £773,086,000, the section with which we are particularly concerned showed a substantial rise. Again, while there was generally an excess of imports over exports of £549,772,000 (excluding bullion and specie), in the electrical branch there was a favourable balance of £11,955,076.

The Physical Society's Exhibition.

Annual Display of Electrical Instruments and Scientific Apparatus.

(*Continued from page 92.*)

Morgan Crucible Co., Ltd.

The various articles on this stand illustrated the scope of "Morganite" material for the manufacture of resistor elements of either low or very high ohmic value, with a specific

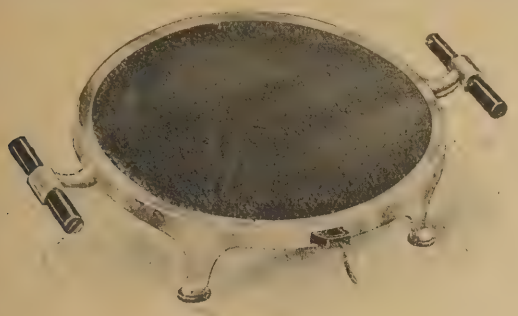

Fig. 9.—Circular Hot Plate.

resistance ranging from 0.01 to 100×10^3 ohms inch cube. Domestic hot plates are shown in figs. 9 and 10, fig. 11 illustrating one of several patterns of portable radiators. Heaters are also made for fixing flat on a wall or floor skirting without

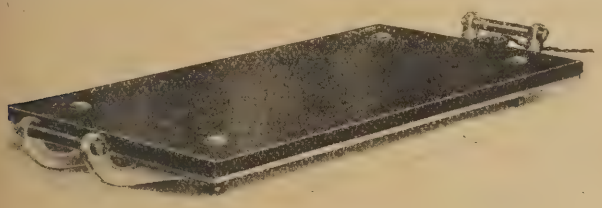

Fig. 10.—Domestic Hot Plate.

risk of scorching; as they occupy the minimum space, they should be very serviceable in confined spaces. For laboratory and industrial use a plain hot plate is made, resting on an

Fig. 11.—Portable "Morganite" Radiator.

earthenware tile. The ceramic, porcelain-like nature of these heaters enables them to be washed like china ware, and there are no metal parts to require cleaning.

Evershed & Vignoles, Ltd.

The representative display on this company's stand included two new items. One instrument is a development of the well-known "Megger," and has been designed to overcome the difficulties which have been experienced in measuring the resistance of earth plates. The trouble has been to eliminate back e.m.f. due to electrolysis under moist soil conditions and stray leakage currents. It has been necessary to find a method of eliminating these outside factors and making sure that the resistance measured is that of the earth plates alone, and also that this value should be accurate, for the "three-reading" method involves complex calculations and is not always accurate, as conditions may change during the test. It would seem that the use of alternating current would cancel out both electrolytic back e.m.f. and vagabond currents, but it has been impossible in the past to use a.c., because the true ohmmeter, such as that used in the "Megger" testing set, is of the moving-coil type, which requires direct current. The difficulty can be overcome in a very simple manner by providing a.c. for the earth plate and d.c. for the ohmmeter; which has been accomplished by using a specially-constructed "Megger" set having a mechanically-operated reversing switch on the same shaft as the generator armature, interposed electrically between the earth plate and ohmmeter section of the testing circuit.

The electrical recorder has made very rapid strides of late, and Messrs. Evershed & Vignoles have constructed several special instruments recently of considerable interest. The integrating weight recorder shown in fig. 12 is similar to those

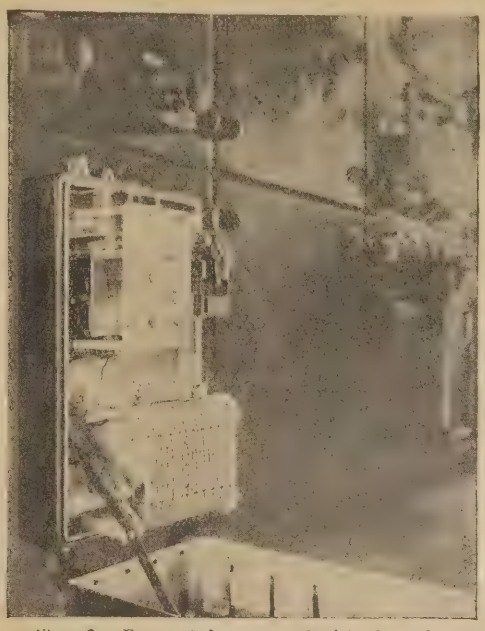

Fig. 12.—Evershed Integrating Weight Recorder.

supplied to Messrs. Henry Simon, Ltd., for installation in grain elevators, the purpose being to provide a record of the operation of an automatic tip weigher. The movements of the latter are shown in the form of a stepped chart, each step representing one movement of the weigher. An arrangement is provided by means of which the pen is returned automatically to its zero position at hourly, or other, intervals (fig. 13), the

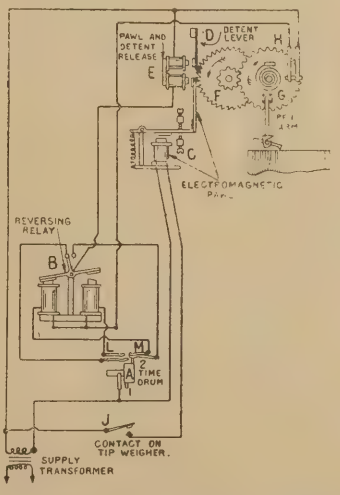

Fig. 13.—Diagram of Integrating Mechanism.

total amount handled by the tip weigher hourly being shown by the length of the hourly total. The recorder shows the regularity, or otherwise, of the operation of the tip weigher in addition to the total number of operations per hour. The instrument is of the duplex type, the record of the operations of the tip weigher being shown on the same chart roll with the power consumption of the operating motor. (Current, pressure, speed, &c., could be shown.) The value of a duplex chart of this kind can readily be appreciated from the fact that irregularities in the operation of the tip weigher can be checked against corresponding fluctuations in the power consumption of the motor. The tip weigher may be concerned with grain, or it may deal with fuel, or any other material in bulk, and

the same principle of operation may be used for checking any automatic machine operations, indicating the headway of tramcars, &c.

The method of operating the "weight" portion of the recorder is shown by fig. 13; a transformer supplies operating current at 25 volts, and the pen-arm mechanism includes the gear wheels F and G, the latter carrying the pen, and the wheel movement being controlled by the electro-magnetic pawl C and the lever D. When the tip weigher moves, contact J closes momentarily, the circuit including C being completed, and the arm attached to C is pulled down; the gear train is moved one notch and held by lever D, carrying with it the pen one step to the left on the chart. The next operation of the weigher again closes J, repeating the cycle and carrying the pen another step to the left. The integrating mechanism by means of which an hourly total of the weight handled is provided, is controlled by the drum A, which carries arms 1 and 2, making contact with L and M alternately at intervals of one hour (as the arms are diametrically opposed on the drum, which revolves once in two hours). When arm 2 reaches M it energises electro-magnet E, which pulls down pawl C and lever D from the ratchet wheel, thus allowing the spring-controlled gear train to return the pen to its zero position. Contact H is consequently closed, and B switches F out of circuit, so that the pawl and detent lever fall into position again ready to operate at the next movement of the tip weigher. At the end of the next hour arm 1 closes contact L, and the cancellation is made in a similar manner to that described above.

Two new ranges of the "Meg" insulation tester are shown for the first time; the 100-volt 20-megohm and the 250-volt 50-megohm ranges, both supplied with variable or constant-pressure generator, for testing grid leaks, anode resistances, the insulation of low-pressure lighting circuits, and for the telegraph companies. The recording "Dionic" tester provides a continuous record of the changes in the impurity content of condensate, boiler feed, &c., and has been considerably improved in detail. The instrument exhibited was similar to those installed in Valley Road electricity works, Bradford, Barton Bridge power station, Manchester, and the new Barking station.

Nalder Bros. & Thompson, Ltd.

Amongst the apparatus on this firm's stand the well-known "N.C.S. Ideal" series of a.c. instruments included watt-meters, ammeters, voltmeters, rotary power-factor indicators, rotary synchroscopes, and deflectional frequency meters. The latter three classes of instruments are of the "Nalder-Lipman" moving-iron pattern and a novelty was the combined power factor meter and ammeter for use in the control rooms of large stations (fig. 14). The two meters are housed in a rectangular case measuring 10¼ in. by 5¼ in. by 5 in., which can thus be mounted side by side, taking up very little space.

Another new apparatus is the steam turbo-alternator efficiency indicator (Turner's patent), the electrical portion of which is illustrated in fig. 15. The complete indicator may be considered as a combination of two pieces of apparatus: (i) An indicating wattmeter operating the "Willans line" drum, and (ii) a Venturi, or any other, watermeter indicating the steam

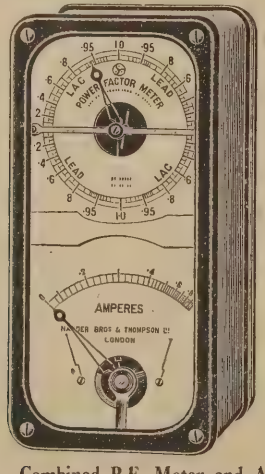

Fig. 14.—Combined P.F. Meter and Ammeter.

consumption of the machine. Alternatively, a steam-flow meter can be used, but it is not considered that this is as satisfactory as a water-flow meter. The wattmeter is of the unbalanced-load induction type of special design, but, instead of being fitted with a pointer, the scale of kilowatts is delineated on the lower periphery of a drum. On the drum is delineated the "Willans line" of the particular machine in connection with which the instrument is to be used, as well as lines above and below this, showing definite percentage variations therefrom.

As the drum rotates the portion of the "Willans line" corresponding with the load on the machine is visible and the guaranteed steam consumption at this load is read on a vertical scale which is parallel with the axis of the drum and at right angles to the wattmeter scale. On the opposite side of the same vertical scale a pointer moves up and down which is actuated by the water or steam-flow measuring apparatus dealing with the condensate or steam. This indicates the actual steam consumption against the kilowatt output, and it can be seen immediately whether the consumption is in accordance with, or is better or worse than, the guaranteed figure without the necessity of having to make a number of carefully-organised simultaneous readings on the different instruments usually situated in different places, and a subsequent reference to the guaranteed steam consumption figures of the machine. This combined instrument should be of material use in ensuring that the general conditions of working of the machine are being properly maintained.

Should the steam consumption be indicated as too high, and it is observed that this is not due to a low steam pressure, steam temperature, or vacuum, then the reason may be looked

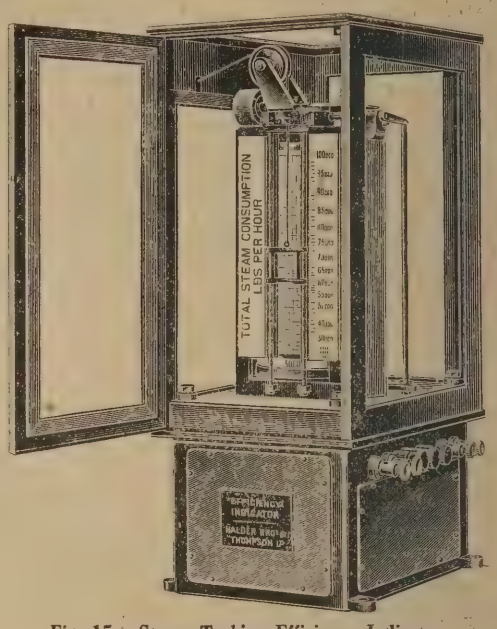

Fig. 15.—Steam Turbine Efficiency Indicator.

for in hot bearings or in deterioration or damage to turbine blading, nozzles, and/or diaphragms, or in leakage of steam through blading running clearances and labryinths or other glands. Causes which, without the instrument, might continue untouched for a considerable period can thus be detected without unnecessary and costly delay, and the risk of possibly a serious breakdown can be obviated. The readings can be logged as part of the regular station routine and thus provide a continuous check on any deterioration from the guaranteed efficiency, and incidentally show any improvement that there may be in the running.

A complete line of protective relays was also shown, including super-sensitive (Fawssett Parry patent) types and relays for Merz-Price protection systems and developments thereof.

Dubilier Condenser Co. (1925), Ltd.

This firm's products need no introduction; they included devices of varied kinds, both for "broad-catchers" and commercial work. Condensers for high-power circuits can be supplied for radio-frequency currents up to 250 amperes and for audio-frequency voltages exceeding 60,000 volts. Mica insulators for continuous-wave radio apparatus involve small losses and are reliable in prolonged service, and a compact arrangement of condensers in a metal box is made for reducing radio interference due to sparking dynamos, motor-cars, &c. Besides the neon-lamp wavemeter the firm's short-wave heterodyne wavemeter has a tuning range of from 50 to 500 m. and is provided with a screened case to eliminate hand-capacity effects. As its name implies, the "Univane" condenser is so arranged that the rotation of the knob of the condenser moves only one vane of the set at a time. As soon as one movable vane interleaves with the fixed vanes, a second is rotated into position as the knob is turned, and thus the full movement from minimum capacity to maximum requires several complete revolutions of the knob, which enables very fine tuning to be obtained. The number of times that the knob has been turned is shown on a small auxiliary indicator attached to the front of the instrument alongside the dial.

Mullard Radio Valve Co., Ltd.

Besides the Holweck molecular pump, a fine range of valves was on view, and it was noticed that a new range of modulating valves has been added to cope with the increase of broadcast telephony transmission, ranging from 150 to 600 watts; also a rectifying valve of special low impedance for service use, and a special valve for dealing with small powers at voltages up to 30,000 r.m.s. The glass transmitting valves have been modified to permit of satisfactory operation on wave-lengths down to 20 metres, and a recent addition to the range is the T.5A, rated at 1 kW anode dissipation, suitable for transmission on the shorter wave-lengths. Two new water-cooled transmitting valves displayed can deal with an input of from 30 to 35 kW.

(To be continued.)

New Electrical Devices, Fittings and Plant.

(Readers are invited to submit particulars of new or improved devices and apparatus.)

Agricultural Electric-Motor Outfit.

The accompanying illustration, fig. 1, is of a 6-h.p. electric motor and starting equipment combination, one of a range of such portable sets which is being produced in Austria for agricultural purposes. The equipment is mounted on

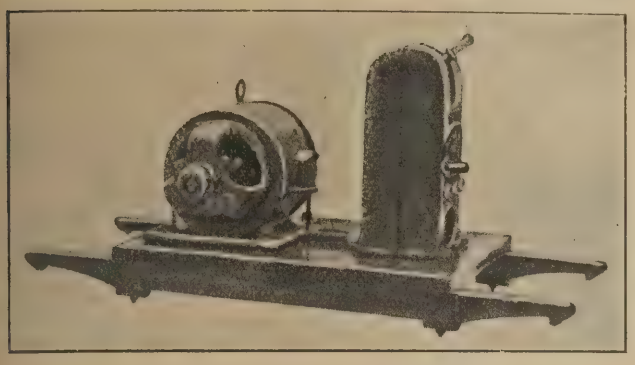

Fig. 1.—Agricultural Electrical Equipment.

either hand carriers or two- or four-wheel trucks. In the former case the hardwood bearers are provided with four short spikes by which a secure foundation for the set on the ground is secured.

An Electro-Magnetic Fuel Pump.

A considerable advance will probably be made in the direction of the fuel feed for automobiles by the introduction of the "Autopulse," fig. 2, a production of Zephyr Carburettors, Leamington, in this country, for which MESSRS. R. M. PAPELIAN, LTD., Wolseley House, Piccadilly, London, W.1, are the sole concessionnaires for Europe. The device forms, it is claimed, a small, durable and very efficient pump, giving about 5,000 strokes to a gallon of fuel at the rate of from 800 to 1,000 strokes per minute. The length of the stroke is from 0.025 in. to 0.030 in. The pumping element takes the form of a bellows into which the petrol is drawn through a strainer and a valve situated in the centre. Attached to the bottom of the bellows is a metal disk or armature, which is actuated by a special electro-magnet element. The coil of the latter is controlled by an ignition switch, and the attraction

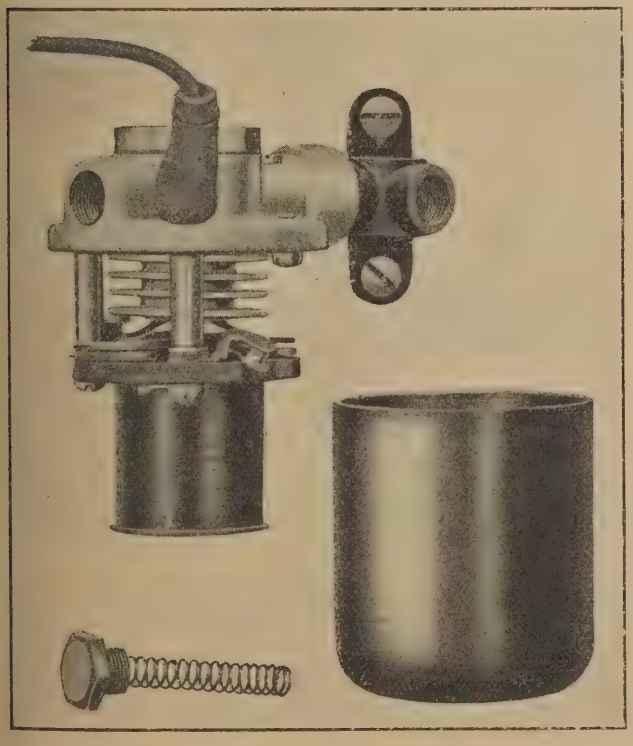

Fig. 2.—Electro-Magnetic Fuel Pump.

of the armature when the coil is energised represents the suction stroke. The delivery stroke is effected, when the coil is de-energised, by a spring placed vertically and centrally in the coil. This is stressed by the magnetic pull on the armature during the suction stroke, and in consequence applies the necessary pressure to close the bellows in return. Arcing at the switch contacts is claimed to be reduced to vanishing point by means of a "short-circuited" secondary winding in which a demagnetising current is induced, neutralising the effect of self-induction at the time of the break. The device is made up in combinations suitable for any number of cylinders.

A Novel Electrical Cooker.

An interesting electric cooking device in which, it is claimed, a whole meal may be cooked in one utensil, is described in *Electrical Merchandising*. The cooker, fig. 3, which is a pro-

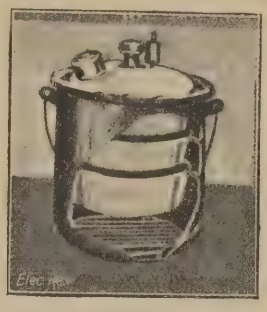

Fig. 3.—One-Utensil Electric Cooker.

duction of the SELFSEAL PRESSURE COOKER COMPANY, 92, 150th Street, Jamaica, N.Y., consists of a cylindrical outer vessel of strong enamelware, in which white-enamel inset dishes are accommodated in a combined meat rest and lifting rack.

An Electric Light Extension Bracket.

A recent introduction into the electric-lighting field is an extension-bracket lighting fitting, fig. 4, produced by the SUN ELECTRICAL CO., LTD., 118-120, Charing Cross Road, London, W.C.2. It is designed for use in workshops and offices, &c., where it is desirable to vary within small limits the

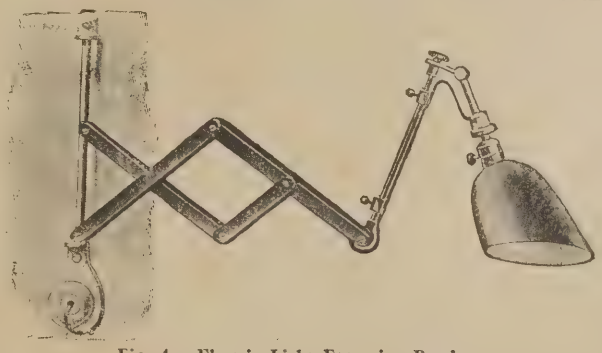

Fig. 4.—Electric Light Extension Bracket.

position of the source of light. The brackets are adjustable in any position within a radius of 180 deg. and at any distance up to 5 ft. extension. The reflectors are of aluminium, especially designed to effectively shield the eyes of the user from all harmful glare. The device is supplied in either black enamel or nickel-plate finish.

An Improved Conduit Fitting.

A new design of continuity conduit fitting which should prove of interest to electrical contractors, wiremen, &c., has recently been put on the market by the SECURITY FOUNDRY CO., LTD., Birmingham Road, Oldbury. The fitting is of the split pattern, the two halves being hinged at one side. Near each aperture are provided two internally-projecting collars, half on each section, which are designed to grip the conduit when the fitting is tightened up. Lugs with free and screwed eyelets are provided on the opposite side to the hinges so that the gripping is effected by means of small screws, which are tightened up after the conduit and wires have been assembled. It is claimed that efficient continuity is obtained with this device. Accessibility for inspection and the other advantages of the split fitting are also features of interest.

A New Electric-Lamp Lock.

We have received a sample of another form of electric lamp lock, designed to prevent the removal of lamps by unauthorised persons, which is being marketed by MESSRS. FRANCIS LAMP LOCKS, LTD., 83, Pall Mall, London, S.W.1. The device consists of an inner collar which is screwed into an outer one. A clutch gear allows the two parts to be turned in one direction only so that the combined device can be lengthened but not shortened. It is placed over the bottom of the holder with the inner collar at the top, and the lamp is inserted afterwards. The combination is then "expanded" so that a turn-in flange on the inner collar will lock at the ridge at the bottom of the thread on the lower portion of the holder, and the bottom of the outer collar will lock at the top of the glass bulb below the cap.

The Institution of Electrical Engineers.

South Midland Centre, Annual Dinner.

THE annual dinner of the South Midland Centre of the Institution of Electrical Engineers was held at the Grand Hotel, Birmingham, on Wednesday, January 13th, the chair being occupied by Mr. F. J. Moffett, chairman of the Centre. Covers were laid for some 300 members and guests.

Mr. J. SMEDLEY-CROOKE, M.P. for Deritend, Birmingham, proposed the toast of "The Institution of Electrical Engineers." He spoke of the great influence which the Institution had attained in the country, and emphasised the value of the work which had been done for the industry both during and since the war.

Mr. R. A. CHATTOCK, president of the Institution, in responding, pointed out that the uses of electricity were growing from day to day and it was the duty and work of the Institution to help that development along. The success of the Institution seemed to have inspired certain members of the engineering profession to try to go one better. He referred to the proposals made recently to form new institutions dealing only with small sections of the electrical engineering profession. It looked as if the proposal to form a wireless institution would be carried through. Surely the parent institutions were large enough and knew sufficient to foster the sections of the industry. He did not think there was any justification for forming smaller institutions which only tended to fritter away the strength of the industry and to divide its members when they might very much more advantageously get together and benefit each other. He felt that the duplication of papers to be read was very unwise and also, with new institutions springing up, time was demanded which it was very difficult for a busy man to give. Turning to the proposal to supply hot water to a district from a generating station, Mr. Chattock said that the capital cost of supplying water to a district was very heavy, and in addition to that there were pumping costs. He went into the matter some years ago in connection with the Summer Lane station and came to the conclusion it would be much cheaper for a householder to heat water by coal or coke. There was another proposal which had been made, to take the generating station to the pit head, but electrical engineers required water even more than coal and an enormous quantity would have to be available before economy could be obtained.

Mr. S. T. ALLEN, borough electrical engineer, Wolverhampton, submitted the toast of "The Electrical Industry." He laid stress on the value of co-operation and suggested that the time had arrived when they ought to consider and bring about what might be termed the first British National Electrical Congress. If such a gathering could be got together, representing all sections of the industry, it could review the present position and determine the best and most efficient methods of dealing with the great developments they could all foresee, so that all sections could go forward in step.

SIR T. O. CALLENDER, in reply, referred to the enormous changes and advances which had been made in the industry. He spoke of his visit to the United States, and pointed out that electricity was almost universally used in that country, not only in the large towns but also in out-of-the-way places.

A presentation of a silver fruit dish was made to Mr. Chattock to celebrate his election to the position of president of the Institution.

Mr. F. J. MOFFETT, in proposing Mr. Chattock's health, spoke of him as a member of the Institution, as an engineer, and as a man. Since his first coming to Birmingham, Mr. Chattock had been a consistent supporter of the Institution and in particular of the local Centre. Twice he had occupied the chair, and he had done much personally for the success of the Centre. The great and successful undertaking of which Mr. Chattock was the chief, was sufficient evidence of his abilities as an engineer, and as a man they would agree that while much of the success of the undertaking was due to the engineering abilities of their president, yet a considerable element had been his human side.

Mr. CHATTOCK, in returning thanks, said his work in Birmingham had been a pleasure, and it had been contributed to very largely by the wholehearted support he had received from the committee and staff of the electric supply department.

Principal GRANT ROBERTSON (Birmingham University) proposed the toast of "The City of Birmingham and Electricity Supply." He spoke of the time when electricity might do much to make Great Britain prosperous, happy and strong. He hoped that would be realised, but there were two requisites; one was that they should do nothing to prevent, and everything to promote, the study, research and teaching of science as a national duty. The second was that they had to get the public to understand what could be done for civic life if they took science seriously and then applied it in every possible way to the amelioration of civic and other conditions. In this country we had been held up by the apathy and ignorance of the general population.

Coun. C. T. APPLEBY (chairman of the Works Sub-Committee of the Electric Supply Committee) responded.

The toast of "Kindred Societies and Guests" was proposed by Col. J. F. Lister and responded to by Mr. H. E. Yerbury, deputy city electrical engineer, Sheffield.

The Annual Dinner of the Western Centre.

The annual dinner of the above Centre was held at the Hotel Metropole, Swansea, on January 11th, about 150 members and guests being present. Mr. J. W. Burr, M.I.E.E., presided, and was supported by Messrs. Roger T. Smith and J. S. Highfield, past presidents of the Institution, and Mr. P. F. Rowell, secretary.

Among the guests were: Prof. F. Bacon, M.A., Swansea; Mr. H. Spence Thomas, president of the South Wales Institute of Engineers, Mr. Martin Price, Cardiff, Sir Arthur Whitten Brown, K.B.E., Swansea, Mr. A. J. Ostler, Bristol, president-elect of the Electrical Power Engineers' Association, and a number of representatives of various electrical and engineering undertakings. Mr. R. A. Chattock, president of the Institution, was unable to be present owing to a hastily convened Joint Industrial Board meeting.

Mr. WILLIAM MORGAN, president of the Swansea Chamber of Commerce, proposed the "Institution of Electrical Engineers." He said the Institution was formed in 1871, and now had 12,000 members, including practically every prominent authority connected with the profession. They had in Mr. Burr an excellent chairman of the Western Centre.

In reply, Mr. ROGER SMITH said that the Institution's efforts had been crowned with success, and the Western Centre was the brightest jewel in its crown. "Kindred Associations" was given by Mr. William Nairn, Bristol, and in reply, Mr. SPENCE THOMAS welcomed co-operation between the Institution and the body he represented. The South Wales Institute of Engineers was only too ready to afford other institutions any facilities it possessed. Mr. THEODORE STRETTON, president of the Association of Mining Electrical Engineers, said that his Association was not a rival to the Institution, but a nursing ground for it. Mr. T. E. ALGER, president of the Electrical Contractors' Association, said that his Association fully appreciated the splendid work done by the Institution. It was the Institution of Electrical Engineers, under the able guidance of Mr. Wordingham, that inaugurated the scheme of a National Register for Electrical Contractors. At the present time it was a matter of voluntary registration only, but he was hoping that it would become compulsory for every electrical contractor to have a certificate of registration before carrying out work to be connected to supply mains. The compiling of a code of rules by the Institution for the installation of electric lighting and power had, to his knowledge, been a long and tedious process, and much valuable time had been given to it by the Committee responsible. In the past this country had suffered through the want of standardisation of electrical materials, and the code would simplify matters not only for contractors but also for manufacturers. He was pleased to note that the Fire Offices Committee had issued a list of some 90 or 100 insurance companies, which had adopted the regulations of the Institution of Electrical Engineers.

Mr. W. J. BACHE, Cheltenham, proposed "The Visitors," to which Alderman I. BARCLAY OWEN, Mr. F. G. WAINWRIGHT and others replied. "The Land We Work In" was proposed by the CHAIRMAN, who advised greater advertisement by Wales of her manufactures. It had been rightly said that the British were too prone to self-depreciation, and would advertise foreign goods which were very often the offspring of British brains.

Canadian Hydro-Electric Development.—In the field of hydro-electric power Canada has made remarkable strides. At the end of 1924 the power actually harnessed was 3,590,000 h.p., calculated on the basis of 80 per cent. efficiency and 24-hour flow. In 1925 a further 725,000 h.p. was installed, bringing the total to 4,315,000 h.p., and work upon an additional 1,100,000 h.p. is proceeding. The use of water-power is estimated to effect an annual saving of 90,000,000 tons of coal. —*Reuter's Trade Service.*

Electrolytic Disinfectant Plant.—We have received a copy of a special report on "Twenty Years' Working of the Electrolytic Disinfectant Plant of Poplar," by Fredk. Wm. Alexander, medical officer of health for that borough. A new building and plant has recently been added to the installation, and some particulars of the new equipment are embodied in the report. The plant was supplied by Messrs. Mather & Platt and consists of five 30-A Graphode electrolysers, each with eight cells and arranged for series working from the 230-V d.c. supply mains. Each electrolyser is provided with a vulcanite tank, a draw-off cock and a cooling coil. The electrical equipment comprises a 30-A d.p. reversing switch, a pressure regulator, and a suitably scaled ammeter and voltmeter. The circulation of the electrolyte is maintained by the action of the electrolyser. The current is reversed periodically to ensure even wearing and cleaning of the electrodes. The total output of the plant, assuming four 2¼-hour runs per day, is 157½ gallons of sodium hypochlorite at a concentration of 10 grms. of available chlorine per litre, which is equivalent to approximately 300 gallons per day at the concentration of fluid distributed from the existing magnesium hypochlorite machines. With the cost of salt at £4 per ton and electricity at 2.25d. per kWh, it is estimated that the cost of the sodium hypochlorite at the above strength will be 1.6d. per gallon.

The quantity of fluid prepared and distributed since the initial installation of the old plant amounts to over one and a quarter million gallons at a total cost of £2,858, £1,575 for materials and £1,283 for electrical energy.

Electricity Supply in Great Britain.

Particulars of the Government Scheme.

ON Friday last, at a meeting of the Midland Union of Conservative and Unionist Associations at Birmingham, Mr. STANLEY BALDWIN, the Prime Minister, outlined the scheme which has been adopted by the Cabinet for the development of the supply of electricity in Great Britain. He said it was known that the consumption of electricity in this country was very much less than in many countries overseas. He could not agree with those who claimed that industrial efficiency could be attained by increasing the use of electrical power; nevertheless, electricity offered great advantages to the industrialist and to the domestic consumer. Exaggerated views had been put forward on this subject; cheaper power by itself would not revive industry, for the cost of power formed but a small proportion of the total manufacturing costs. But within the next 15 years a conservative estimate indicated that the consumption of electricity, at present 200 units per head per annum, would be at least 500 units per head; and it should be possible during that period to save many millions of pounds by cheapening electricity supply. It was of the first importance that ample supplies of power should be available where they were wanted; that the sources from which it was derived should possess adequate reserves; and that those sources should be interconnected, so that any industry could be certain of obtaining power whenever it was required.

He asked whether they were to-day making the best use of the national resources. The subject was investigated some years ago by a strong Committee over which Sir Archibald Williamson [now Lord Forres] presided, which concluded that the system of generation of electricity in this country should be radically changed; the parochial system must be abandoned, and industrial consumers should be supplied from a common source, thus adding to the economy of large-scale production the advantage of improved load factor, which was of vital importance.

Briefly reviewing the history of the electricity supply industry and the recommendations of the Williamson Committee, Mr. Baldwin referred to the creation of the Electricity Commission in 1919, and outlined the work which the Commissioners had accomplished; he said that the difficulties of reorganisation which they had met with had been very great, and the present Government, with the aid of a committee of which Lord Weir was chairman, had re-examined the whole position. It was found that in this country there was an excessive number of small generating stations with high working costs, and that there were 16 frequencies in use which differed from the standard frequency. As a result of these investigations the Government had formulated proposals which would be laid before Parliament in the next Session, and which had for their purpose the improvement of the system of generating electricity. He emphasised the fact that the generation and the distribution of electricity were separate processes, each with its own problems; the former was an engineering question, the latter primarily commercial. It was not sufficient to provide a cheap supply of electricity; a good selling organisation was also essential. The distribution of electricity was already carried out on a large scale by competent organisations, such as the power companies and the big municipalities; smaller companies and municipalities were also actively dealing with the distribution of electricity to local consumers. The great need was to reduce the cost of distribution and to facilitate the formation of new authorities to undertake the supply of electricity in areas not yet covered.

As for generation, the process of concentrating all demands on large, efficient, and interconnected stations was proceeding slowly, and legislation was necessary to hasten it. The Government proposed to strengthen the powers of the Minister of Transport and the Commissioners and to set up an Executive Board covering the whole country, to establish interconnecting lines and to co-ordinate existing and future large power stations in large areas. By "Board" he did not mean a Government Department; what they had in mind was a board controlled by practical men in close touch with the industry, such as the Port of London Authority. The new Board would raise its own capital and would work on commercial lines. After it had earned interest and sinking fund on its capital, any surplus that might remain would be applied to the reduction of charges to the undertakings which it supplied.

A Government subsidy would not be required, but in order to enable the scheme to be carried out, a Government guarantee would have to be extended to it, like that given under the Trade Facilities Acts. The Board would construct interconnecting lines so that undertakers whose stations were inefficient could close them and obtain a cheaper supply from the Board's stations. The larger stations would be operated by their present owners, and future stations by those who built them, but all would work together under the Board, producing a common supply of electricity which the Board would purchase and place at the disposal of the distributors. The Board would be provided with the necessary powers to bring everybody into line, and one of its duties would be to make the frequency uniform in all the areas as they were co-ordinated. He knew that the necessity for this standardisation was not universally accepted. It was true, in the case of a non-standard area, that so long as it could remain isolated the advantages of a change-over were reduced by the cost and inconvenience of the change, but taking the country as a whole, and having regard to the anticipated rapid increase in the use of electricity, the benefits to both the consumers of electricity and the manufacturers of electrical apparatus of a single standard frequency, he was informed, were very great.

The Board would have to carry out standardisation of frequency at its own cost in all the areas as they were connected up, and they were advised that this outlay would be fully off-set by economy in generating costs. At the same time, the work of standardising frequency and constructing main transmission lines would be of material assistance to industry, whilst the outlay would be remunerative and would provide work for the electrical and allied industries.

They were satisfied that Government action was necessary to free the industry from the restrictions under which it laboured, and they believed that the scheme proposed would effect this object with the minimum disturbance to existing conditions. It was directed to the single purpose of generating electricity in the most efficient manner, and when this cheap supply was assured they believed that everyone would be able to obtain the electricity that he required.

They did not suggest that this scheme would be the salvation of industry, but every year's delay made co-ordination more difficult and expensive, and they believed that under the stress of modern competition they could not afford longer to neglect the sound organisation of power supply.

On Monday the Electricity Commissioners further explained the Government's proposal to the technical Press. We understand that they anticipate that within 15 years the annual consumption of electricity per head will increase from about 200 kWh at present to at least 500; already on the North-East coast the figure is 800, and at Rotherham it is between 400 and 500. It is hoped by the improved system to make electricity cheaper and more generally available, the latter consideration being as important as the former. The result of utilising a greater horsepower per employé in a factory is, as experience shows, a greater output and a higher rate of wages.

Out of 584 electricity supply undertakings, last year 42 produced half of the total output, at a much less cost than that of the 542 which produced the other half. The Electricity Commissioners have had data prepared for certain districts with great care, using the actual load curves, actual invested capital, estimated cost of changing the frequency, &c., and find that by concentrating generation in the best modern stations, linked up with one another, instead of in the numerous existing stations, the results would be so much improved as to effect savings sufficient to cover the cost of transmission and standardisation, and to lower the price of electricity as well. These figures, we understand, have been checked by independent authorities, and the Commissioners are satisfied that in advising the Government to proceed on the lines set forth in the Prime Minister's speech they are proceeding on the best engineering and economic grounds.

The standardisation of frequency, a necessary preliminary to complete interconnection will, it is claimed, be of enormous benefit to manufacturers, who agree that by standardising their products and manufacturing in bulk they will be able to sell apparatus at lower cost and be better able to meet foreign competition.

An important feature of the scheme is the reduction of the heavy burden of reserve plant made possible by interconnection. Last year 68 per cent. of the capacity of generating plant installed in British works was standing by; when interconnection is complete, 10 per cent. will suffice.

There will be no interference with existing distributors, who, relieved of the task of generation, will be free to concentrate on the distribution problems arising from the new demands, for which their existing mains will be inadequate. The rights of the Power Companies to supply electricity will be respected; the Board will not deprive them of their legitimate output, but care will be taken to see that economies effected by the Board's operations shall be passed on to consumers, and the working of all stations will be controlled by the Board.

It is anticipated that many of the new transmission lines will pass through rural areas and make a supply of electricity available to them, these lines serving both as interconnectors and as supply mains.

The Board will raise its own capital with a Government guarantee, but no subsidy; during the first few years it will pay interest out of capital, and the sinking fund will be suspended. It will not be a profit-making body, any surplus being passed on to the distributors. The compulsory powers of purchase cut out of the 1919 Bill will be restored; selected stations will be retained and worked by their owners under the general direction of the Board, which will decide the load factor at which each station shall operate, so as to secure the most advantageous conditions, as is already done in certain large existing systems. It is hoped to bring about a new era with the minimum disturbance. Compulsory powers will be provided to deal with undertakers who fail to appreciate the advantages of complying with the Board's requirements.

When a cheap bulk supply has been brought about by the Board with the help of the existing stations, and accompanied by standardisation of frequency, pressure, and systems of charging, the British electrical house will have been set in order.

Correspondence.

Correspondents should forward their communications **at the earliest possible moment.** *No letter can be published unless we have the writer's name and address in our possession.*

An Electric Vehicle Association.

I read with interest Mr. J. C. Elvy's suggestion as stated in his letter on page 118 of your issue of January 15th, putting forward the desirability of forming immediately "an association, institution, or society, consisting of those who are interested in any way whatsoever in electric vehicles."

It seems rather strange, after all the work that has been done by various persons interested during the past twelve years, not to mention the activities of the Electric Vehicle Committee and the continuous publication of a journal specially devoted to this subject which has now reached its 98th number, that this Rip-van-Winkle-like project should be put forward. One would think that Mr. Elvy had been living on another planet.

Mr. Elvy's doubtless well-meaning proposal should be regarded, in my opinion, in the light of Mr. L. L. Robinson's recent very timely remarks anent the undesirability of redundant and quite unnecessary further institutions, associations, or societies.

The Electrical Development Association, under the able direction of Mr. J. W. Beauchamp, assisted by the *personnel* of the Electric Vehicle Committee, may very safely be left to take whatever steps are practicable to maintain and advance the interests of the electric vehicle industry.

As Mr. Elvy wishes to assist this industry, I am sure he will agree that his efforts will be best directed towards co-operating with existing Institutions.

Raymond J. Mitchell, M.I.E.E.

London, *January 15th*, 1926.

Overhead Distribution.

As Mr. Redgment is retiring from the lists after his letter in your issue of the 8th, I will not occupy much of your space. I trust, however, that in the coming developments in the district, with which I hope he will be concerned, he will remember the æsthetic considerations which have been so largely neglected by engineers.

My main point is that a pole line is essentially ugly, and if sometimes it is a necessity, it is a very unfortunate one.

If, as foreshadowed in the original article, compulsory powers are given, I do not see where the difficulty of cross-country runs comes in, as compared with roadside way-leaves. It is to be hoped, however, that whatever Government authority is responsible will prove as enlightened as the Road Board, who in their treatment of the countryside, and their consideration for ancient bridges and interesting buildings, have shown that modern needs are not incompatible with the more abstract amenities of life.

In conclusion, I would assure Mr. Redgment that I did not challenge the statement of relative costs to save myself the trouble of working out the figures, but because I had already roughly done so.

S. E. Glendenning.

Norwich, *January 16th*, 1926.

Hidden Dangers.

I trust that the leading article in your current issue will receive the serious consideration it deserves.

Apparently the Home Office electricity officials are powerless to act; therefore, may I be allowed respectfully to suggest to electricity supply authorities that they could render a public service by circularising their customers with an inexpensive "warning" leaflet. Do not wait for a fatal accident as a means of warning, which incidentally would reflect adversely on the electrical development movement.

There should be no need to convince *bona-fide* electrical engineers that the danger is real, but I may inform them that in response to a letter I wrote to the lay Press (published on December 9th last) apropos electric model railways, I have received documentary evidence of shocks and injuries received.

Taking one, for instance, the writer is resident in S.W.12 postal area, and the electricity supply is 205 volts a.c. pressure, which I believe to be the County of London Electric Supply Co.'s area.

He appeals to me to do all I possibly can "to stop this kind of diabolical toy being sold." It appears that in adjusting the rails he received a severe shock and could not release himself from contact until someone who was fortunately in the room switched off; he dreads to think of the consequences if it had been his child, for whom the toy was purchased as a Christmas present; the shock might easily have proved fatal in that case. As it was, the writer had to be treated for burns and shock to system.

Obviously the risk is still existing when the lamp is removed in view of the "earth" neutral return and the possibility of metal work unintentionally "earthed" being in the room where the toy may be erected.

J. C. Elvy.

London, *January 15th*, 1926.

Telephone Charges.

No doubt many telephone subscribers will be rather startled by what is termed "An Important Notice" in the form of a leaflet attached to their accounts, which refers to non-payments.

Amongst the contents thereof we read: "Recent investigations show that the cost entailed by temporary suspensions of the service owing to non-payment has now reached a sum of about £25,000 per annum.

The layman who reads this may gasp at such a huge sum, but the *bona-fide* electrical man who knows anything about the subject will look upon these figures as absurd, unless the operator who withdraws and replaces the plug of the defaulter is paid a specially high rate for the simple operation.

The telephone has now become a great public advantage, and should not be hampered by high and unnecessary charges.

I wonder how many business men, especially in the electrical trade, have gone into figures as to the cost of a telephone installation when they are charged £1 15s. per quarter for hire of the Exchange line.

Considering that they pay full price for all their calls, the sum is perhaps round about that of a full-blown money-lender. Would not the popularity of electricity supply soon fade if station engineers so charged for their "lines"?

In my district we should be pleased to lay a great many yards of heavy underground cable to a consumer if he would pay seven pounds per annum for the hire of it, plus all he used, like telephone calls, into the bargain.

Archie Gamble.

Electricity Works, Chirk.

Tough Rubber Trailing Cables.

With reference to Mr. Brooking's letter on the above subject, I would state that I have been purchasing trailing cables with the earth braid fully surrounding the conductors.

However, I do not think that it is standard practice to purchase this type of cable, and many collieries are still using the type with the parallel earth wire. The fact that cable makers are manufacturing this class of cable, with the surrounding earth shield, only serves to emphasise my point that such cables are safer than the type with a separate earth wire incorporated in the cable.

As my paper was only published in extract form, it is quite possible that Mr. Brooking may have been misled.

I. Sclar.

Dunfermline, *January 11th*, 1926.

A Pneumatic Flexible Coupling.

I was very surprised to see, in your January 8th issue, the pneumatic tire form of flexible coupling described as a new idea. I would like to draw your attention to patent specification No. 123,482, and French patent 537,452, whilst as long ago as No. 21,692, of 1895, the same principles were applied between driving and driven members.

C. H. Clarke, F.C.I.P.A.

Snaresbrook, *January 13th*, 1926.

Electrical Engineering in Nigeria.

I should be extremely obliged if you could put me in touch with any electrical engineer who has had service in Nigeria.

"Of the Making of Books——"

A gentleman who either acquired, or had thrust upon him, a reputation for great wisdom, on one occasion is said to have remarked: "Of the making of books there is no end." As that gentleman lived and died during the 10th century B.C. one trembles to think what he might have said had he been here to-day.

In 1920 I received an announcement from some publishers that a certain book was in the press and would be completed shortly. The approximate price would be 50s. I was invited to order, and I fell. In 1921 the first volume, price 25s., came along. In 1923 the second volume, price 35s., was delivered. In 1924 the third volume, price 55s., which no one had expected, completed the contract.

Even with this experience I hadn't learnt wisdom, for some two years ago I received a notice to the effect that yet another book was to be produced—one day. Approximate price 25s. It was a subject which interested me, and I 'phoned asking when it might be expected. The reply was "In a few months." In a few months I 'phoned again and the reply was "Early in the New Year" (1925)—they seemed annoyed at my persistence. Two weeks ago a beautiful tome came along—size outside covers 10 in. by 7.5 in. by 1.5 in.—containing less than 300 pages, price 36s. In the introduction it is remarked that while the subject was progressing it was deemed advisable to split the work into two volumes and the next would be ready shortly—or in the next New Year, or sometime, price ——? Will it, think you, be necessary further to sub-divide this volume, and let us wait yet another year?

I have some technical books averaging 1.7 inches between covers, and averaging 700 pages, price—present day, not pre-war—25s. Is it therefore necessary to double the thickness, and nearly treble the weight of paper to run up the price?

I appreciate to the full nice binding, nice paper, nice printing, and so on, but surely *editions de luxe* are unnecessary in technical books? Books without number were bad enough, but anyway one had a book. Now that it is a matter of books of limitless size, and each work a small library, I suggest that it is time to call a halt. Most technical books are out of date in quite a few years, and I suggest that publishers should not mulct the poor wretches who have to buy them further than is necessary to secure a fair return to themselves, to their printers, and, if anything is left over, to the authors.

I put this wail forward in all deference and shall be interested to hear if any other victims share my views, or if my complaint is unreasonable.

January 7th, 1926. **F. T. Fawcett.**

How Will "Government" Electricity Affect Us?

Let us take the good points of the scheme first. Unification of generating systems and a spread of transmission systems over the country is certainly desirable if it can be accomplished without increasing the cost of electricity to the public, and so far the scheme is all to the good; at any rate, it will ensure that these problems are carefully thought out.

The scheme, within a reasonable period, will provide a lot of work for the cable makers, plant manufacturers, and their employés.

The bad part of the scheme as it is presented by the Press is that it is dressed up to impress the public that they may expect immediate reductions in the cost of electricity. As usual, the public comes last; he may hesitate, expecting more favourable conditions, and so produce a slump. In my opinion, cheaper prices cannot result at once. The scheme is one which will not begin to show its effect much under 10 years, and will not be really beneficial to any large extent under 20 years.

The scheme, as presented by the Press, leads the public to believe that the cost of generation is the alpha and omega of the electricity supply business. This is by no means the case.

Let us assume for a moment that the provision of super-stations can save 15 per cent. of fuel and 20 per cent. of the plant cost, as compared with a good modern medium-sized station. Even then these advantages will be counterbalanced largely by the extra cost of transmission.

The promoters claim that the load factor on super-stations will be so large that it will counterbalance the disadvantage of high cost of transmission, but nobody has ever taken the trouble to prove this.

A few years ago I collected the whole of the load curves for the London area, super-imposed them, and thereby compared the load factor for the large area with the load factors of the individual areas. It was not materially greater.

The Government scheme appears to me to overlook the enormous importance of improving the load factor within each distributing area. This can only be done by making it possible for the consumers to use electricity for all purposes, such as water heating, lighting, heating, power, cooking, &c., quickly, instead of being satisfied with having so many consumers who use electricity for lighting only and not worrying about the other uses.

Electricity for lighting is cheap, owing to the great economy of modern lamps, even if the charge per unit is so high as 6d. or 8d. Electricity for lighting can never be supplied very cheaply, because the capital involved is used for so few hours during the year. However, if lighting is made to bear its proper proportion of capital cost and other overhead charges, as it easily can, the other uses can be supplied at extraordinarily low rates; in fact, I have several consumers using electricity for all purposes, who on our normal sliding scale get their supply to-day for less than 1d. per unit.

In my area, where we have realised the importance of sales and development, we already have one out of every 10 consumers cooking by electricity, and a consumer who cooks, heats and warms his bath-water will, without any alteration to his service connection to the main, use over 2,000 units per annum, whereas with lighting only he might not have consumed 200 units.

In the area with which I have the honour to be connected, I do not find that the cost of the electricity is the bar to large consumption. The difficulty is the cost of installation and apparatus, and I think the Government will enormously improve their scheme if they give to all undertakers full powers to sell and hire apparatus and installations, and full powers to enable them to provide large demonstration establishments for the education of the public in the proper use of electricity. Probably under the Trade Facilities Acts, the distribution and installation side of the business could have the help which is being proposed for the generation side of the business, and in my opinion it is at this end of the business that Government assistance will produce results more rapidly.

L. L. Robinson.
Borough Electrical Engineer.

Reviews.

Transmission Circuits for Telephonic Communication: Methods of Analysis and Design. By K. S. JOHNSON, Member of Technical Staff, Bell Telephone Laboratories. Pp. viii + 326; illustrated. London: The Library Press, Ltd. Price 21s. net.

This volume is the evolutionary product of notes made by the author during the past 15 years. In their original form they were utilised by him during the session 1918-19, when conducting a special course for other members of the Western Electric Co., who were interested in the analytical study of telephonic transmission. In the winter of 1921-22 they were used in a series of lectures at Harvard University at the invitation of the Electrical Engineering Department of that college.

The scope of the work is "to cover the general theory and principles which are applicable to the development and design of circuits and lines for association with such telephonic instruments as transmitters, receivers, and vacuum tubes."

The reader is expected to be familiar with the elements of alternating-current theory, the operations of the differential calculus, and with the notations and operations of the "complex quantity" method of representing alternating functions.

There are in all 19 chapters and seven appendices dealing successively with the acoustical properties of the voice, ear, transmitter and receiver; measures of telephonic frequencies; circuits involving simply transmitters and receivers; simple series circuits; Kirchoff's laws and reciprocity theorem; characteristics of ideal transformers; transformer and transition losses, Thévenin's theorem and equivalent T networks; computation of transmission losses; substation circuits; treatment of passive networks as equivalent smooth lines; transmission characteristics of telephone lines; loaded circuits; telephone repeaters; resonant and anti-resonant circuits; theory and

design of wave filters; corrective networks or equalisers, and superimposed circuits. It will, therefore, be seen that the problems of transmission which the telephone engineer has to deal with at the present day have been adequately covered. Not the least interesting chapter in the book is that in which the author, in dealing with measures of telephonic frequencies, discusses the "transmission unit." Although there is much to be said in favour of the American definition of this unit, it is somewhat premature, pending the decision of the International Conference, to call it "the new transmission unit." The "βl" form has still to be reckoned with.

From first to last, the entire treatment of the subject is thorough; the reader being led gradually from the simplest line problems to those of considerable complexity, as in the case of passive networks. The increasing importance of filters has been fully appreciated by the author, who discusses the theory and design of the various types of wave filters in a clear and exhaustive manner. In fact, the clarity of exposition is one of the many excellent features of this manual—a statement which cannot be applied indiscriminately to works of this class.

The compendium of mathematical formulæ and the mathematical appendices given at the end is the most complete we have yet seen. The text is exceedingly well printed, and numerous diagrams are given illustrative of the associated subject matter.

The book will undoubtedly take its place as one of the best manuals that have yet appeared on the subject of telephonic transmission.

The Nagaoka Anniversary Volume. Pp. xvi+423; illustrated. Tokio: The Imperial University.

This volume is dedicated to Prof. Hantaro Nagaoka by his friends and pupils to mark the completion by him of 25 years' professorship, and has been in preparation, under the guidance of a committee, since February, 1921, but publication was delayed by the great earthquake in Japan. Prof. Nagaoka, who was born in 1865, took the degree of D.Sc. at the Tokio Imperial University in 1893, and as a Government student studied in Europe under such men as Helmholtz and Planck. In 1896 he was appointed to the chair of Physics at his mother University, his present post. He has received many distinctions, including that of Hon. Fellow of the Physical Society of London, in company with Mme. Curie, Lorentz, and Michelson. His scientific work has been specially directed towards magnetism and geophysics, and, more recently, radio-transmission. He is credited with being the first to propound the nuclear structure of the atom, in December, 1903, a subject in which he is keenly interested.

The splendid volume before us contains a list of Prof. Nagaoka's published papers, and a symposium of more than 40 papers by different authors on physical subjects, of which a considerable proportion deal with electrical phenomena. Amongst the latter are the following: "A sensitive electroscope," by T. Shimizu; "Electrically deflagrated mercury filament as a flash light for instantaneous photography," by K. Suychiro; "A component anemometer," by K. Fuji; "The effect of magnetic fields on electrical resistance of some alloys," by J. Obata; "Studies on dielectric hysteresis and allied phenomena," by H. Saegusa; and "The electric resistances of tungsten wires," by J. Tsukamoto.

The book is admirably produced, the paper, printing, and illustrations being of the highest order, and worthy of the notable occasion which it celebrates.

Trade-Mark Applications.

THE following are among the recent applications for British trade marks. Objections against any of the proposed marks may be entered within one month from January 13th. In the case of foreign applications, the names and addresses of the British representatives are also given:—

Hush-A-Phone, New York (lettering and design). No. 457,459. Class 8. Sound-muffling devices for use with telephones.—The Hush-A-Phone Corporation, 19, Madison Avenue, New York. (Dr. A. L. Mond, 19, Southampton Buildings, W.C.2.)

Director (lettering and design). No. 459,088. Class 8. Apparatus for use in automatic telephony.—Automatic Telephone Manufacturing Co., Ltd.

Nanazo. No. 458,865. Class 8. Electric cables.—Cable Makers' Association.

Solex Signs (lettering and design). No. 459,774. Class 8. Electrical advertising signs.—Solex Signs, Ltd., Windsor House, Victoria Street, S.W.1.

Radiovim (lettering and design). No. 464,154. Class 8. Apparatus for use in radio-telegraphy and telephony.—Radiovim, Ltd., 24, The Elms, Dingle, Liverpool.

Listron. No. 464,598. Class 8. Detector crystals for use in radio-telephony and telegraphy.—G. J. Barley, 30, Ranelagh Gardens, Barnes, S.W.13.

Enoni. No. 461,832. Class 13. Electric lamps (ordinary).—Osram Gesellschaft, Berlin. (Cruikshank & Fairweather, 65-66, Chancery Lane, W.C.2.)

Orion. No. 464,223. Class 13. Electrical fittings.—Magyar Wolfram Lampa-Gyar Kremenezky Janos Reszvenytarsasag, Budapest. (Dicker and Pollak, 20-23, Holborn Viaduct, E.C.1.)

Orca. No. 464,612. Class 50. Electrical insulating goods.—Etablissements Poulenc Frères, Paris. (Carpmaels & Ransford, 24, Southampton Buildings, W.C.2.)

Shannon Scheme Dispute Ended.—It is reported that the strike which was holding up the Shannon hydro-electric scheme has been brought to an end by a decision of the Limerick dockers to unload the steamers which are bringing materials for the scheme to the Free State.

Published Specifications.

Compiled expressly for this journal by Patent Agents.
The name of the applicant's patent agent, if any, will be found on the printed specification.
The numbers in parentheses are those under which the specifications will be printed and abridged, and all subsequent proceedings will be taken.

The Government Scheme.

IN our last issue we dealt at some length with the proposals outlined by Mr. Stanley Baldwin in his speech at Birmingham, devoting special attention to the features which involved a heavy capital expenditure—namely, the establishment of a huge grid of interconnecting mains, and the standardisation of frequency which is a corollary to it; we felt it incumbent upon us to utter a vigorous protest against this course at the earliest possible moment, and our action has received support from various quarters. It will be within the recollection of our readers that the president of the Institution, Mr. R. A. Chattock, expressed similar views with great earnestness in his inaugural address to the Institution of Electrical Engineers; and his immediate predecessor, Mr. W. B. Woodhouse, in the course of an interview with a representative of the *Yorkshire Post*, adopted a similar attitude, pointing out that there did not appear to be any advantage in linking-up power stations situated in different coalfields. In his opinion it would be preferable to ascertain in each area what was in the best interests of the public. As long ago as last April we adversely criticised a scheme which closely resembles that embodied in the proposals of the Government, and over a year ago we questioned the advisability of erecting long mains all round the country, and the wholesale standardisation of frequency. Similar views are expressed by contributors elsewhere in this issue, and last week Mr. L. L. Robinson sent us a letter to the same effect. It is interesting to note that Prof. G. Forbes, so well-known in connection with the inception of the Niagara scheme, favours the retention of the 25-cycle frequency.

But we did not pretend to exhaust the discussion of the scheme, which embodies many other features, less controversial than those to which we have referred. The new Executive Board will be charged with the duty of building new power stations wherever they are required and are not otherwise provided, and will control the operation of all the large power stations so as to secure the best possible results. It would appear, therefore, that in some respects it will perform the functions and possess the powers which were outlined for the proposed Joint Electricity Authorities in the Bill of 1919, but which were cut out by the action of the House of Lords.

It is not clear to us why the original intentions are not to be carried out, or why a nation-wide district should thus have been superimposed upon the Electricity Districts which have been delimited by the Electricity Commissioners during the past six years. Apart from the famous grid and the standardisation of frequency, the new Executive Board appears to be a glorified Joint Electricity Authority with the difference that its members will not be elected. If the full powers were conferred upon the existing J.E.A.'s and the various Advisory Boards were abolished and fully representative Authorities armed with the necessary powers, were constituted in their place, development could proceed on the normal lines contemplated in the 1919 Bill. Each District would be licked into shape by its own Authority; the existing works would be purchased where necessary, and new stations would be erected as the need arose, all such stations within the bounds of a given District being interlinked. Inefficient stations would be closed or converted into substations, and the supply would be extended by the activities of the Authority into those areas where it is not at present available. Each area having thus been developed up to its boundaries, would eventually link up with adjoining areas by a natural sequence, and the national network would come into existence automatically. That capital would be forthcoming for these purposes without the aid of the State cannot be questioned, in view of the readiness with which the public has over-subscribed for the new issues of electricity supply companies in recent years. The Authorities were empowered by the Act of 1922 to lease the undertakings to private enterprise, over which, of course, they would retain control to ensure that prices and dividends were regulated in the interests of the consumers, as is done by the Public Service Commissions in the United States. Such a procedure would involve the minimum of disturbance to existing conditions and would facilitate rapid development on normal lines. The standardisation of frequency could be undertaken as and when it was required, and each District would remain under the control of men who were familiar with its needs and its resources. Unfortunately, an unsensational programme such as this would have lacked the political attractiveness of such a magnificent "gesture" as that presented by a proposal to cover the whole country with a grid of super-high-pressure mains and to scrap all a.c. apparatus not endowed with the magical frequency of 50 cycles.

As the Prime Minister pointed out, one of the greatest needs of the present time is to hasten the introduction of electricity supply into the areas which do not yet enjoy that advantage. How many and how large are those areas will be gathered from the series of maps which we are publishing from time to time, for the express purpose of drawing attention to these uncultivated fields. Whether the occupation of such areas would be hastened by the installation of a "grid" of overhead mains at a pressure of 100,000 volts is somewhat questionable. It must be borne in mind that to tap a 100,000-volt main is no light matter; it involves the erection of switchgear capable of breaking an enormous wattage at every tapping point, together with step-down transformers, at a prohibitive cost, and as the time pressure would be subject to very wide fluctuations, pressure-regulating apparatus must be provided under the control of a competent staff. Such tapping points, therefore, must be limited to the smallest possible number. Far less expense would attach to the use of automatic substations on distribution mains at 20,000 volts, which would suffice if there were no question of linking far-distant stations, as in the case of a supply from the Joint Authority's mains. That the Electricity Commissioners contemplate the tapping of their interconnecting mains, thus converting them into busbars, cannot be doubted in view of their own statement that these mains would pass through rural districts and distribute electricity to the local townships on the line of route, a system which appears to us highly objectionable on technical grounds.

Big Men and Big Policy.

In a leading article entitled "Men of Vision" (ELEC. REV., October 23rd, 1925, p. 641), in referring to the greatness of the future of electricity supply business in the United Kingdom, we ventured the opinion that big and commanding personalities would be required—"men of the grand vision type." We quoted an American view, which showed that, in spite of the advanced state of electrical development in the States, the need was felt for more big commercial men with vision at the head of their public utilities. Mr. Lloyd, the chairman of the Commercial Section of the National Electric Light Association, expressed the need of commercial departments of utilities for more leaders with broad enough vision to see the real problem that lay ahead—men of outstanding ability to see that the big problems of those departments were economic as well as technically commercial. We expressed the hope that as the day of big areas was with us, the parochial spirit would give place to the larger view and create conditions favourable to the development of big men. The subject is of interest in connection with excusable speculation that is being indulged in regarding the *personnel* of the new Board of business men that was referred to in Mr. Baldwin's Birmingham speech. But apart from that bearing of the subject, we are interested in a further view expressed in the States. This time the counsel comes from the president of Mr. Lloyd's Association, the N.E.L.A., and it is issued as a "Challenge to Commercial Men." If anybody else follows a recent newspaper stunt lead and suggests that Britain needs to look to the States for experts to help her in the work of electrical development, let him read the views of Mr. James E. Davidson, the aforesaid president, in his challenge in the *Electrical World* for January 2nd, where he shows emphatically that the American electric light and power industry needs a better merchandising spirit and greater activity in building up the residential load. Mr. Davidson says that, while any company with a reasonably good organisation and sufficient credit can build up a physical property, it requires a well-organised operating and sales organisation to bring complete success. Much of the success so far has "naturally gravitated" to the systems with little aid from sales-work. "Sales activity alone would take the unprofitable valleys out of the landscape of the electric light and power industry." All that is required to adequately serve the consumer and to increase earnings of the shareholder is "sufficient interest in the sale of energy and in merchandising, 'bang-up' sales organisation, careful planning, and the expenditure of good, hard energy."

Having said these things ourselves so frequently, though in our own terms, we quote them with full approval, because they apply appropriately to the situation on this side. Let us hope that the importance of sales organisation will be appreciated in its true light by those who have the selection of the right men to guide our national commercial electrical policy.

Super-Sales Organisations.

THERE was one sentence in Mr. S. Baldwin's Birmingham speech which deserves to be isolated as a particularly fruitful subject for meditation. Here it is: "It is not enough to have cheap electricity available, there must be a good selling organisation ready to meet the particular requirements and idiosyncrasies of the actual individual consumer, who is the man we want to benefit, able also to extend the uses which consumers make to-day of electricity—in short, to apply all the skill and energy peculiar and necessary to the salesman." Mr. Baldwin has nearly, but not quite, hit the nail on the head. He is right as to the indispensability of a "good selling organisation," but that dictum would equally apply to any industry, say to the ready-made clothes business. But in the latter case a manufacturer establishes a factory routine by which he turns out a stock of suits at very low prices and then sends out an army of salesmen to dispose of them. It was this somewhat faulty

analogy that Mr. Baldwin seems to have had in mind when he premised that "it is not enough to have cheap electricity available." As a matter of fact, you cannot have "cheap electricity available" in the sense that you can have ready-made suits available. You can have, of course, a highly-efficient station, but whether the electricity turned out is cheap or not depends on what the salesmen sell. If they don't sell enough, the station is insufficiently loaded and the cost is dear, and the same applies if the salesmen do not sell a *varied* supply. So, in a sense, you do not have "cheap electricity available" for the salesman to sell—but his selling makes the electricity cheap or dear, as the case may be. Mr. Baldwin, therefore, was right in his estimate of the importance of the selling organisation, but he under-estimated it by an unconscious assumption that the sales organisation was provided beforehand with cheap electricity to sell instead of its being itself a factor in making it cheap. Of course, it may be retorted that this is only a quibble, as in actual practice a salesman is sent out with prices. But such prices are the result of the previous salesmen's successes or failures. It is the sales that, within limits, regulate the costs. For instance, a London company had not a "cheap supply" to offer to the Southern Railway—but it knew that when its "sales organisation" had secured the load its costs would be such as to allow it to give a cheap supply with a margin of profit. So the "sales organisation" is, as Mr. Baldwin premised, a most important factor in bringing into actuality a "cheap supply," given, of course, as an antecedent, efficient plant and a comprehensive distribution system. But has this importance of the "sales organisation" been adequately appreciated up to the present? In some undertakings it may be so, but in many this side of the business is not accorded much dignity, to say the least of it. But how, as we have shown in the preceding leaderette, when groupings and co-operation are tending towards bigger units of administration, the importance of the "sales organisation" will be proportionally increased, and it is to be hoped that the Prime Minister's words quoted above will not fall on deaf ears. Super-power station development must be accompanied by super-sales organisations, if they are to result in cheap electricity!

A National Electrical Convention.

At the dinner of the South-Midlands Centre of the Institution of Electrical Engineers, Mr. S. T. Allen, borough electrical engineer of Wolverhampton, put forward with much emphasis a proposal that a great national convention comprising all the leading British electrical societies should be brought together. This is an idea with which we are in hearty sympathy. We have made similar suggestions from time to time during the past twenty years, and it will be remembered that in 1921 the matter was under serious consideration at the instance of Major H. Richardson, who was then burgh electrical engineer of Dundee, and was also that year president of the I.M.E.A. Mr. Allen is a past president of that Association, and for some years served as chairman of the Electrical Development Association; he has also been chairman of the South-Midland Centre of the I.E.E., and has taken an active part in many other organisations. He is therefore well acquainted with the conduct of conventions on the modest scale which they have hitherto attained in this country, and is fully aware of the enormous amount of labour involved in the preliminaries and in the actual performance on such occasions; he is also, we believe, well informed regarding the methods adopted and the procedure in vogue at the huge conventions of the National Electric Light Association, which are held annually in the United States. The fact, therefore, that he is advocating such an assembly encourages us to believe that the suggestion is practicable. It has been urged in opposition to previous proposals of this nature that it would be impossible to find accommodation for an attendance of, say, 2,000 persons at any suitable town in this country; but in refutation of this objection we may point out that the British Association annually holds a convention of similar magnitude and succeeds in finding accommodation for its members at various centres in turn. It would seem, therefore, that this particular difficulty is not insuperable, though it may be necessary to choose the month of September for the purpose of the Convention.

It may be questioned whether the advantages derived from holding a joint meeting counterbalance the drawbacks attending such a huge gathering; obviously there would have to be several meetings in progress at the same time, and the proceedings, if printed, would constitute a bulky volume of which only portions would be of value to individual members. On the other hand, full weight should be attached to the enormous influence that would be exercised by such a convention upon the minds of the outside public. On such an occasion the lay Press would be represented in full force, and the publicity that would result would be of immense value to the electrical industry in all its branches. There is no doubt that efficient advertisement is of the first importance to the development of the electrical industries, and there is no better advertisement than such a congress as that which we have in view.

The organisation of the convention would occupy many months; it could not possibly be held before the autumn of 1927, even if the preparations were set on foot at once. If, therefore, Mr. Allen's suggestion meets with general approval, and it is desired to hold a congress next year, immediate action must be taken to ascertain the views of the various councils concerned, and if they are favourable, to set up the necessary machinery for the purpose. Expressions of opinion from those who are interested in the scheme would be welcomed.

How?

The engineer who knows how, is the man to consult. The other man who doesn't may pose admirably; but he cannot always pose.

No engineer, nor any man, knows *how* all round, however. The *bona fide* engineer is always progressing because always learning. This questing spirit becomes a habit. Such a man is always respected if not liked. The slacker or the impostor knows him and shuns him as poison. He remains a learner to the end, and thus may be truly named *master*. He carries through life his child's thirst for information. He asks many questions, and patiently wins an answer. He finds things out. Every time he makes an experiment, he asks a question; often it takes months, sometimes years, to obtain a definite reply. Usually he spells out the answer slowly, painfully; and only partially. Other and kindred inquiring minds carry the solution a stage further.

There is no royal way to learning; research wins most of its trophies hardly and slowly. Yet the gains which are gathered amply repay those who toil. More than anything else, however, it is the quest which is at once its own lure and its own superabundant reward. So men—engineers—are learning to apply X-rays for the inspection of metals. Flaws, it is claimed, can be detected even though they be hidden under three inches of steel. With almost infinite patience other men are building up non-ferrous alloys. All this is done by the informed and persistent asking of questions—the finding out *how*.

It is not every one who can be a pioneer, nor everyone who has the opportunity or the ability to prosecute elaborate and important research work. All, however, can use and develop the natural powers of observation; all can cultivate the true spirit of inquiry, and can learn *how* things are done, and how these things function. It means carrying on through maturity that passion for knowing the inwardness of things which characterises the earlier years of life. In the case of the engineer, this temper naturally expresses itself in the determination to understand and master processes. The young engineer especially should keep eyes alert and mind active. The thing after a time becomes almost second nature. It is the Sherlock Holmes instinct applied to the physics of the workshop, the test bed, and design. It is akin to the quest of a Pasteur, a Marconi, a Sorby, a Parsons, a Bragg.

Electricity Supply in Great Britain.—X.*

South Wales and Monmouthshire.

THE South Wales Electricity District, as provisionally determined by the Electricity Commissioners in 1920, includes the following areas:—

The County Boroughs of Cardiff, Merthyr Tydfil, Newport and Swansea;

The Administrative Counties of Brecknock, Carmarthen, Glamorgan, Pembroke and Radnor;

The Administrative County of Cardigan, except so much as comprises—The Municipal Borough of Aberystwyth, the Rural District of Aberystwyth, and the Rural District consisting of the Township of Ysgubor-y-Coed;

The Administrative County of Monmouth, except so much as comprises—The Municipal Borough of Monmouth, the Urban District of Chepstow, the Rural Districts of Chepstow and Monmouth.

The accompanying maps cover the whole of this Electricity District, as well as the parts of Cardiganshire which are included in the North Wales and South Cheshire Electricity District, and the parts of Monmouthshire included in the Lower Severn Electricity District (as provisionally determined).

Electricity Supply in Glamorgan and Monmouthshire.

The South Wales Electrical Power Distribution Company has various powers under its Acts over the whole of the county of Glamorgan and that part of Monmouthshire which lies to the west of the River Usk, including the associated County Boroughs, as well as several Electric Lighting Orders and Electricity Special Orders over certain areas for general supplies.

The following is the list of existing authorised undertakers (whose areas are shown hatched); those owning generating stations are printed in heavy type:—

LOCAL AUTHORITIES.

Ogmore Valley Elec. Light & Power Supply Co., Ltd.
Penarth Electric Lighting Co., Ltd.
Pontypool Electric Light & Power Co., Ltd.
South Wales Electrical Power Distribution Co.

All the above undertakers (except where otherwise indicated) are in the South Wales Electricity District;

[1] In North Wales and South Cheshire Electricity District.

[2] In Lower Severn Electricity District. (The Chepstow E. L. & P. Co.'s area extends into Gloucestershire.)

* Parts I-IX of this series appeared in the ELECTRICAL REVIEW of October 9th, 16th, 23rd, and 30th; November 13th and 30th, December 1th and 25th, 1925, and January 15th, 1926.

this coincides with Area No. 12 of the Electricity Commissioners' publication "Generation of Electricity in Great Britain," in which the following figures are given for this District:—

Year ending March 31st.	kWh generated.
1922	124,596,623
1923	144,579,252
1924	172,929,418
1925	206,611,941

The total h.p. of electric motors in the coal-mining industry of South Wales and Monmouthshire is nearly half a million, but it is estimated that the public supply stations generate about one-third only of the electricity used for power purposes in this District.

Unfortunately the frequency of the Power Company's supply is 25 cycles, whereas the plant of the Corporations of Swansea, Cardiff and Newport is nearly all 50 cycles, but with a standardisation of frequency and a linking-up of stations in this District, new records might be set up in the electricity supply industry.

The areas for which applications have been lodged are also shown hatched on the maps. Certain particulars of these are given in the Fifth Annual Report of the Electricity Commissioners and also in the *London Gazette*.

The application of West Gloucestershire Power Company, Ltd., includes the Urban District of Usk, the Rural District of Monmouth, and parts of the Rural Districts of Chepstow and Pontypool.

The South Wales E.P.D. Company have applied for Special Orders in respect of the Urban Districts of Llantarnam and Llanfrechfa Upper, and for parts of the Rural Districts of Llantristant and Llantwit-Fardre and Cowbridge. Other applications have been made by the following local authorities:—

Pontardawe Rural District Council.

Brecon Corporation.

Llantarnam Urban District Council.

Barry Urban District Council.

Porthcawl Urban District Council.

Bridgend Urban District Council.

The Brynamman and District Electric Supply Company, Ltd., has also applied for statutory powers.

The following particulars are taken from the 1921 Census:—

Administrative County and Associated County Boroughs.	Acres.	Persons.	Resident families.	Buildings not containing dwellings.
Brecknock ...	469,281	61,222	13,350	885
Cardigan ...	443,189	60,881	14,909	1,128
Carmarthen ...	588,472	175,073	39,056	2,317
Glamorgan ...	520,456	1,252,481	263,857	10,314
Pembroke ...	393,003	91,978	21,131	2,649
Radnor	301,165	23,517	4,913	463
Monmouth ...	349,552	450,794	96,346	4,091
Total ...	4,004,013	2,115,946	453,562	21,847

*These maps are reproduced by permission of the Controller of H.M. Stationery Office. The originals were prepared by the Ordnance Survey Department for the 1917 Boundary Commission.

The following alterations of areas, &c., have been made since 1917:—

(1) The Parish of Pontyberem has been created by uniting parts of the Parishes of Llanelly Rural, Llannon, Llanarthney, Llanddarog and Llangendeirne.

(2) Part of the Parish of Llanstadwell has been added to the Urban District and Parish of Neyland.

(3) The County Borough of Swansea has been extended so as to include the Urban District and Parish of Oystermouth, the Parishes of Brynau, Cockett and Llansamlet, and parts of the Parishes of Clase Rural and Penderry. The remaining parts of these two Parishes have been united to form the new Parish of Llangyfelach. The Parish of Brynau has been added to the Parish of Oystermouth, and the Parishes of Cockett and Llansamlet, and the included parts of the Parishes of Clase Rural and Penderry have been added to the Parish of Swansea.

(4) The Parish of Saint Kingsmark and part of the Parish of Saint Arvans have been added to the Urban District and Parish of Chepstow.

(5) The Parishes of Henfynyw Lower and Llanddewi Aberarth Lower have been amalgamated to form the new Parish of Aberayron, co-extensive with the Urban District of Aberayron.

(6) The Urban District and Parish of Margam, the Parish of Michaelston Lower and part of the Parish of Baglan Lower have been added to the Borough and Parish of Aberavon, which have been re-named the Borough and Parish of Port Talbot.

(7) The remaining part of the Parish of Baglan Lower (see alteration No. 6) was added to Urban District and Parish of Briton Ferry.

(8) The Urban District and Parish of Briton Ferry (as enlarged by alteration No. 7), and part of the Borough and Parish of Port Talbot and part of the Parish of Llantwit Lower have been added to the Borough and Parish of Neath. The remaining part of the Parish of Llantwit Lower was added to the Parish of Clyne.

(9) The Rural District of Llandaff and Dinas Powis has been re-named the Rural District of Cardiff.

(10) Parts of the following Parishes have been added to the County Borough and Parish of Cardiff: Caerau, Llandaff, Llanedeyrn, Llanishen, Michaelston-super-Ely, Saint Fagans and Whitchurch. The remaining parts of the Parishes of Caerau, Llandaff, Llanishen and Michaelston-super-Ely have been added to the Parishes of Michaelston-le-Pit, Leckwith, Lisvane and Saint Fagans, respectively.

(11) The Urban District and Parish of Goodwick have been created by uniting parts of the Parishes of Jordanston, Llanwnda and Manorowen.

(12) The Parish of Clyne has been divided into two new Parishes, called the Parish of Clyne and the Parish of Tonna.

*1917 Boundary Commission Maps (scale: four miles to one inch) are obtainable, price 6d. each, from Messrs. Edward Stanford, Ltd., Long Acre, London, W.C.2.

The Shift Engineer Abroad.

By A. E. HAMPSON.

"HELL!" said the Driver, expressively, "it's 'ot." It was. At 8.30 on a mid-December night in Central West Africa it generally is, but in a power house with two gas-engine units running full blast, to those who have experienced it, "hot" becomes a totally inadequate description, and for them the prospects of after-life can hold no terrors. Flies, moths, mosquitoes, and flying ants circle in ever-increasing and never-ending swarms round the four three-hundred candle-power lanterns that illumine the station: bright, questioning eyes of natives, drawn by the magnetising influence of this brilliantly-lit "ju ju" house, peer in—then silently pass on into the black, outer wall of darkness.

Despite the fact that the two huge swing doors at either end of the station, and every available window, have been opened wide in an endeavour to catch the mythical land breeze, the thermometer remains steadily registering a temperature in the region of 100 degrees, and the rank smell of hot oil permeates the whole atmosphere.

In the top corner of the station, writing at his desk in a meshed-in alleged mosquito-proof office, the Shift Engineer sits checking up the daily log, deciphering Amadu's weird and wonderful figuring, and vaguely wondering why on earth his coal consumption should always be considerably higher than any of the other shifts'. A fairly new hand this, as his immaculately-pressed white ducks and fresh complexion betray. He shifts uneasily in his seat as a slight variation in the monotonous hum of the engines gives warning to his trained senses of a change in load, and as he moves, huge globules of perspiration drop from his face and bespatter the sheets in front of him. He brushes them off impatiently with his handkerchief and rises to his feet as a glance at the clock reveals to him that the time for his half-hourly inspection is overdue.

The engine-room round having been completed to his satisfaction, he enters the sweltering heat of the producer house to find his two native firemen soundly snoring on a bed of matting. Shaking is of no effect, but by dropping a firing tool he manages to awaken them, and an interesting dialogue in "coast" English ensues:—

"Wassamarrer you sleep for work? You think this work be baby palaver? Suppose you think so, I go give you small boy wages."

"Massa," in reproving tones, "We savvy proper this be big man job, so we no sleep. We do sit for ground small and close him heye, but we no sleep."

"You think I be bushman? Why you no wake when I shout for you?"

"Plenty, plenty noise from them engine, Massa, so we no fit to hear you. Look, Massa, we do work proper. We do put coal for them boiler for ten-o'clock time."

And a slate is produced showing their loading figures for that hour. The fact that it is even now only nine o'clock does not discountenance them in the least, and a sound lecture only has the effect of making them lose what knowledge of the English language they possess.

Somewhat wearily, the Shift Engineer returns to the engine room, but only to discover that in the interim his native greaser has fallen asleep hanging on to an engine inspection ladder, the oil-can in his hand dripping a brown stream on to the tiled floor. Thoroughly exasperated, he aims a flying kick at the offender, and greaser and oil-can vanish with a clatter.

He resumes his seat and proceeds with the log checking. The pad-pad of the switchboard attendant's bare feet on the gallery above him has now become more regular, for Amadu has noticed his new master's methods with regret, and has no desire to meet with the same fate as befell the greaser.

Another disturbance, and cries of "Tornado!"—that dreaded African storm—recall the Engineer from his job, and all hands rush to close doors and windows, but not quite quickly enough. A gale of high velocity sweeps through the station, bringing with it flying and stinging particles of sand that cover men and machinery indiscriminately; log-sheets, pens, and almost everything portable, go by the board and leave the station in a fluttering mass. Down comes the rain in a solid wall, blinding and deafening in its roar; but inside all is safe, for doors and windows are now closed. The Shift Engineer breathes a sigh of relief, for the air has become perceptibly cooler, though the thermometer drops slowly, as though reluctant to register any change.

And so things go on. At long last his relief arrives, and the Shift Engineer prepares to depart for a well-earned rest, but as he leaves the station for the comparative dimness of the street, he stumbles into the slinking figures of his native firemen, bearing between them a sack of best Welsh anthracite. The secret of his rising coal consumption is out!

Inventions and Patents in the United States.

The American and British Systems Compared.

By V. C. SAMPSON.

THAT pushful and prosperous land, the United States of America, is so often belauded as the inventor's Elysium that perhaps a brief outline of the actual position, as regards inventing and patenting, may prove of interest. The writer served for some considerable time as chief specification writer, and occasional draughtsman, under a prominent patent-attorney out there, and so may claim to possess some little knowledge of the conditions ruling.

Indubitably, in many aspects, the U.S.A. patent law is much superior to that of Great Britain, or, indeed, that of any other European country, not excepting the far-famed German system. But there are contra disadvantages of weight. There is, for example, no equivalent to our "provisional specification." An application has to be filed complete. This is a serious drawback, especially in complex devices. The provisional protection of British law gives immediate protection to the inventor, but at the same time does not bind him down to a rigid adherence to the original outlining of his conception. By utilising the benefits of a "cognate" application, the inventor can incorporate any detail improvements in the final complete application so long as the fundamental scope of the device is not materially altered or widened. This is a concession of great value; it affords adequate protection to the British inventor during the period of working out the details of his device. With a U.S.A. application, the specifications and drawings as originally filed must go to issue. The only alterations allowable are those compulsorily made in compliance with the examiner's reading of the Rules of Procedure. That is to say, only rectifications of errors are allowed.

Another serious disadvantage is the often quite unreasonable demand for minute sub-division of the subject-matter. Of course, even with a British application, the covering of two distinct inventions by one application would not be allowed. But in the U.S.A. Patents Office the examiners carry this rule to extreme lengths. Often a dozen applications have to be filed to cover one complex contrivance. Readers will have noticed, often, the long string of patents detailed on any American machine of intricate mechanism. This constitutes a grave defect in the U.S.A. patent law. It means that a really strong, or basic, patent is nearly unobtainable. Hence a plethora of weak patents results in endless law suits and interference actions. The protection afforded by a U.S.A. patent is seldom as trustworthy as that of a British one.

These are the main defects; they probably are quite well counterbalanced by the very considerable advantages. For example, the U.S.A. patent is amazingly cheap; it can be obtained with ease and expedition by any person skilled in the procedure; and the search into novelty is penetratingly thorough, so that the issuance of a patent carries reasonable assurance of freedom from that bugbear of the manufacturer—anticipation. Finally, after issuance, the patent runs tax free for the full term of seventeen years, which is an inestimable boon to the poor and struggling inventor.

The Development of the American System.

A brief review of the history and present status of U.S.A. patent law may be of interest. A few patents were granted in the old Colonial days by various governors, but there was no comprehensive law on the subject. It seems to have been mainly a matter of luck—or bribery—whether a patent was obtained or not. Soon after the Republic was constituted, a national patent law was passed in 1790. Under this Act a patent was to be granted for "any useful art, engine, machine, or device, or manufacture, or any improvement therein, not before known or used." Applications under this Act had to be made to a board consisting of the Secretary of State, the Secretary for War, and the Attorney-General. The concurrence of any two of these members was sufficient for the issuance. The life of a patent under this Act was indefinite, the term was agreed upon at the time of granting, but could not exceed fourteen years. Only a nominal fee, about five dollars, was charged for these early patents. The grant of one of these patents was an occasion of state ceremonial. The first was granted on July 31st, 1790, and covered a process invention for the making of pot and pearl ashes. It bore the famous signatures of George Washington, Thomas Jefferson, and Edmund Randolph. This Act was repealed in 1793, on the grounds of inadequacy. Under the new Act, the grant

of patents was restricted to citizens of the United States, or resident aliens; applications had to be made to the Secretary of State, and conflicting applications were pronounced upon by a board of three arbitrators. An important feature was the power given to the District Court to declare fraudulent applications void, on due proof. Supplementary laws and amendments were passed in 1794 and in 1800. In the latter year the rights of aliens to patent grants were reinstated, provided the foreigners were not of British nationality! In 1802 a Superintendent of Patents was appointed to aid the Executive Department. In 1836 Congress passed an Act repealing all previous patent laws, and substituting one embodying some radical changes. A Patent Office was created, with a Commissioner of Patents at its head. The search system was instituted, and a Board of Appeals constituted to hear appeals from the examiners and Commissioner. A fee of thirty dollars was charged under this Act to citizens and resident aliens; subjects of other nations had to pay three hundred dollars, excepting the subjects of Great Britain, who had to pay five hundred! The term of a patent was for fourteen years. In 1861 this was extended to seventeen years, and the discrimination between United States citizens and foreigners was abandoned, a uniform schedule of fees being adopted. Except for a few minor amendments—the law relating to *caveats* was repealed in 1910, for example—the present-day patent law of the U.S.A. is based on this 1861 Amending Act.

Conditions and Fees for Patents.

In brief, then, a United States patent is granted for a term of seventeen years to any person who has invented "A new or improved device of utility." The Government fee is 35 dollars, 15 dollars being payable on application, and the final 20 dollars within six months after notice of allowance is forwarded. No other fees or taxes are charged, and the patent, after issuance, stands for the full term of seventeen years. An exhaustive search is made into the novelty of the device for which a patent is sought. Not only are all United States records examined, but also those of all other countries having a patent system. Further, any technical publication that the examiner may think likely to hold a pertinent reference is searched.

The words "of utility" are important is relation to the grant of a patent. Perpetual motion and kindred schemes cannot be patented in the United States, although in Great Britain such devices, if novel, would be allowable. In past years the examiners held up many valuable, but, at the time, commercially impractical inventions, on the ground of inutility. They are more broad-minded in their reading of the rule at the present day, but, even so, no obviously wild-cat scheme would ever be granted a patent.

A United States patent dates from the time of issue, not application, as in the British practice. The documents do not differ greatly from those used in our own Patent Office, but there are a few minor variances. For one point, in the United States every invention is considered as an "improvement," and this word opens the preamble. Another rule is quite alien to our practice, and, at times, is the cause of considerable inconvenience. That is, when the papers are ready for filing, the inventor must swear, or affirm, that he is or believes himself to be the actual inventor of the device substantially as set forth in the documents. The whole of the papers have to be threaded through with a red ribbon or tape, prior to the taking of the oath, the object being to prevent any alterations whatsoever. This oath must be sworn in the presence of a public notary or commissioner for oaths, with all the documents laid before him. This practice stresses how rigidly enforced is the rule as to alterations.

The rules relating to drawings are meticulously construed, as in our own Patent Office. But the United States Office offers the services of its draughtsmen, at a very reasonable fee, to ensure satisfactory work, and if advantage be taken of this there is little trouble.

"Claims" are a source of considerable dissension between examiner and applicant. By reason of the exhaustive nature of the novelty search, few claims, as originally cast, are allowed. The examiners are almost certain to dig up anticipating references. In fact, practically the whole art of the American patent attorney is devoted to the formulation of strong claims which are yet sufficiently limited in scope to pass the examiners A few examiners are utterly unreasonable in this referencing, and appeals to the Commissioner are frequent. Still, on the whole, with good subject-matter, the prosecution of a successful patent application is not more difficult in the United States than similar work in Great Britain.

The Value of Patents.

Now let us consider the standing of the inventor in the Republic. Undoubtedly, American manufacturers are far keener on new inventions than their British compeers. The man with a good idea, protected by a strong patent, has little to fear over there. He is certain to be taken up at an early date. For him there is seldom the weary, heart-breaking months, or even years, of soliciting that the English inventor so often has to endure. Many of the big corporations keep a private inventors' staff in full employment, and also are ever on the alert to secure good outside inventions. A capable attorney is retained solely to dissect the scope and potentialities of all issued patents relating to the firm's productions. In this connection there is a very unsavoury feature. Some few unscrupulous concerns do not hesitate to set their inventors working to "get round" the issued patent, and only if this attempt prove unsuccessful will they commission their attorney to approach the true inventor with an offer for his device. This sharp practice is not a speciality of the American manufacturer, however. It is a little dodge frequently worked by some English concerns, as many a poor inventor knows to his cost. The only remedy is to make sure of a "holeproof" patent. Taken in the lump, American manufacturers are very fair and just in their patent dealings, and they are often very helpful with the ground work. Inventions, in the United States, are looked upon as wealth-mines of inexhaustible scope and potentialities.

There is a professional association—the Inventors' Guild—and there is at least one weekly of wide circulation devoted entirely to the interests of inventors and their devices. Practically every technical journal sets apart several columns of both news and advertising space to the subject. Even in the lay Press, the "patents for sale and wanted" columns occupy quite as much space as that devoted to "small bus., sweets and tobacco" in our own dailies! Unfortunately, these extensive ramifications attract a huge army of swindlers. Both the Patent Office and the postal authorities do as much as possible to combat the activities of these gentry, but they are experts in sailing along the borderline without actually crossing it, and so not a great deal can be really done to combat their schemes. A number of patent attorneys are not above suspicion. Many accept fees for material which on the face of it is manifestly non-patentable. Some advertise extensively, practically seeking this class of work, as they guarantee "a patent or money back." Under the U.S.A. patent law it is quite easy to obtain a worthless patent in any art by formulating claims covering one or two non-essential details. The records are clogged with thousands of such "patents." One fee-snatching scheme that eventually landed its authors into disbarment proceedings was the offer of silver medals for inventions of "outstanding merit," and the subsequent awarding of such medals to anyone who put up the application fees. This firm was proved to have purchased these medals on several occasions in 5,000 lots! *Inter alia*, this point shows how great is the interest taken in invention in the States. "Patent specialists" abound, and, unfortunately, are beyond the jurisdiction of the Patent Office. They unmercifully rook thousands of inventors (or would-be inventors, to be more accurate). Some of the "stock-selling" schemes originated by these gentry are the last word in misapplied ingenuity. The postal authorities do all they can to scotch these schemes by confiscating the literature and communications sent through the post, when they are recognised,

but many of the less reputable papers, circulating in the rural districts, aid them by accepting their advertisements without question.

Apart, however, from these swindling activities, an amazing amount of perfectly legitimate business is transacted annually. A recent conservative estimate placed the turnover on attorneys' fees alone at more than three million dollars. Then, in the States, practically every attorney runs a sales department in connection with his business, and the profits accruing therefrom represent a considerable addition to that figure.

Chances for British Inventors.

Thus it will be seen that an enormous amount of money changes hands annually over patents in the United States. It is up to the British inventor to go for a share of those "sweets." Provided his device is of fair merit, he need have little fear as to the ultimate success of his venture. Inventions in textile machinery and appliances are especially welcomed, and there is always a wide market for domestic devices. It must be remembered, however, that American domestic life is markedly different from our own—it is far more "mechanicalised." For example, it would be useless to try and market a patent firelighter, because domestic fires are practically unknown. There are numerous lines, however, in which the British inventor could score heavily, for indubitably British inventive genius stands highest in the world for quality, and the American manufacturer is keen on the real good thing. An intensive study of American magazines would soon put the inventor on the right track.

Patent fees in the United States are so low that, to the writer, it has ever been a source of constant wonder that the British inventor does not more frequently avail himself of this wide market for his abilities. The position of the patentee in the States is particularly strong. He can, and does, enforce various penal clauses relative to the selling price and renewal of parts in his device. Invariably it is made a condition of sale that only spares supplied by the manufacturer, or repairs carried out by him, or his authorised agent, are allowed. The Courts construe such inhibitions in the most liberal spirit, and the patentee can often extort heavy damages for the slightest breach of the contract. In one case, the replacement of a simple tie-rod, by the village smith, in a piece of patented agricultural machinery involved both smith and farmer in the payment of very substantial damages.

Inventors in the United States dispose of their rights by (*a*) Outright sale; (*b*) royalty and cash premium; (*c*) "territorial rights"; (*d*) shop rights; (*e*) licence by annual fee or rental, independent of the sales achieved; or (*f*) a combination of such methods. No comment is necessary on the first two schemes, which represent the usual British methods of disposal of patent rights. The granting of "territorial rights" is an interesting and remunerative idea. A manufacturer is licensed to make and sell the device solely in his native territory or state. By this system the inventor gains a plurality of manufacturers marketing his device, with each one possessing an intimate knowledge of the idiosyncrasies of the particular ground which he covers. This enhances the profits, often to a remarkable extent. Under the shop-rights scheme the manufacturer is restricted to the use of the device in his works. In general, this idea is only applicable to costly and intricate process machinery, but the rental charged is invariably high, and taxes for some of the best-paying inventions known are collected under this system. The various patents of the Shoe Machinery Trust are a case in point. Licences by annual rental independent of sales are granted mostly on patented automatic vending machines and amusement devices. Many inventors holding strong patents of great utility combine these methods in their disposal of rights, granting territorial licences to manufacturers in thickly-populated districts, licences by annual fixed rental in sparsely-populated areas, and sometimes exacting a royalty and cash premium in addition.

In conclusion, it will be seen that the potentialities of patents in the United States are exceedingly rich. By carefully studying the rules of procedure, and drawing up the specification in meticulous accordance with them, and especially by concentrating on the claims, a good idea can be strongly protected. The market for patents is much wider than in Great Britain. Not only is the population greater than ours, but, more important, it is one keenly responsive to the appeal of novelty—and it has the cash to gratify its whims. The British inventor who does not take into account the American market is neglecting what is, in patents, the richest field in the world.

A Small Scottish Hydro-Electric Scheme.

The Utilisation of an Old Dam for Hydro-Electric Purposes.

THERE has recently been completed on the River Don a private hydro-electric installation which will be of interest on account of its small initial cost, considering the low head available in the river, and the size of the plant. The latter has been put down for the purpose of generating electricity for a supply to the Castle of Lord Forbes, fig. 1. Normally, in a comparatively slow-moving stream like the Don, the cost of obtaining the necessary head would render the installation of a small plant uneconomical, but by taking advantage of the existence of an old weir which formerly supplied power to a saw-mill of which nothing remained but a few of the foundation stones, and by making use of the old head and tail races which remained, although they had become completely silted up and overgrown, the initial cost of obtaining a five-foot head was greatly reduced.

Fig. 1.—Castle Forbes.

The dam, fig. 2, which is situated about 400 yards below the Bridge of Keig, is composed of large, heavy stones packed together and made tight with cut sods. Several breaches were made good with mass concrete, and a gap was left in the middle to act as a salmon pass. This gap is approximately 6 feet inside, and allows for a depth of 18 in. of water flowing through it when the river is at its lowest level. The normal flow of water in the river above the dam was estimated at 28,000 cubic feet per

minute. Taking into consideration the width, depth, and slope of the old head race, and the necessity of always having an adequate supply free to flow through the gap so as to allow the passage of salmon at all times,

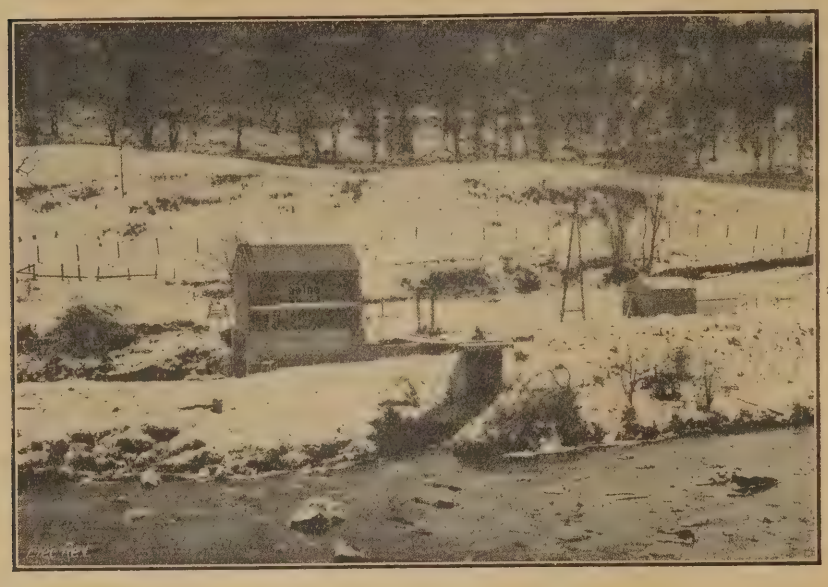

Fig. 2.—The Power House and Dam.

it was found that 4,500 cu. ft. of water per minute could be delivered, with an effective head of 4 ft. 6 in., to the turbine, which would thus develop approximately 30 h.p.

A 33-in. vertical-shaft Francis turbine, capable of developing 29 b.h.p. under a head of 4 ft. 6 in., and utilising 4,380 cu. ft. of water per minute at a speed of 87 r.p.m., is installed. The power is transmitted through bevelled gearing to a countershaft and pulley, thence by belt-drive to a dynamo, fig. 3, running at 800 r.p.m. The desired load from the plant is 14.3 kW, and 16 kW was obtained during a test taken on completion of the scheme. The dynamo, which was manufactured by the Electric Construction Co., of Wolverhampton, is of the over-compounded type, having an output of 16 kW at 285 volts when running at full speed. The compounding is arranged so as to give a constant pressure of 250 volts at all loads. The speed is kept constant by means of an oil-pressure compensating governor which controls the turbine by opening or closing the guide vanes.

The plant runs continuously except for a period of about ten minutes daily, when it is necessary that the governor should be stopped for oiling. The machines are controlled from the power house at the river, and are looked after by an estate pensioner, who spends little more than an hour a day oiling and cleaning the machinery and clearing the gratings.

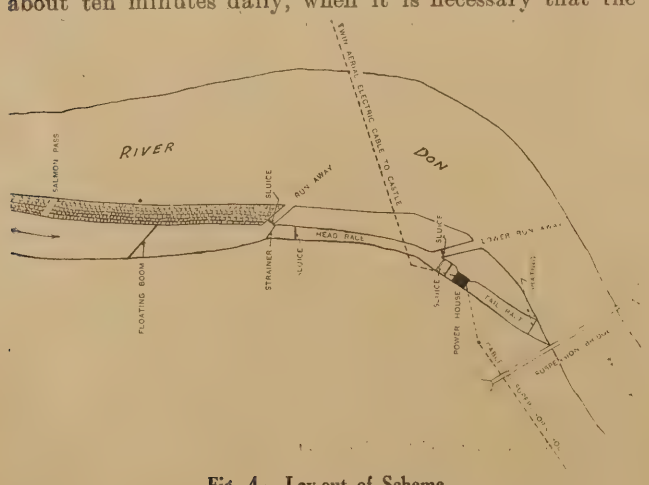

Fig. 4.—Lay-out of Scheme.

Fig. 4 shows the general lay-out of the scheme. It should be noted that two runaways have been put in, one above the top end of head race and the other at the bottom. These enable the head race and the lower end of the dam to be scoured out when necessary. A floating boom has also been placed in the dam to deflect ice, trees, and other débris which would damage or block up the strainer. A longitudinal section through the turbine pit and power house is shown in fig. 5. The electrical transmission from the power house to the Castle, a distance of about 800 yards, is effected by means of an overhead line consisting of a hard-drawn copper stranded cable supported on poles and protected at each end by lightning arresters.

The Castle is wired on the Henley wiring system, and has installed 150 lighting and 11 heating points, and six 2-kW immersion heaters, which are inserted into the domestic-heating boilers. The installation is controlled by a main switchboard equipped with the usual instruments.

The contract was placed with Messrs. Underhill and Ritchie, Ltd., of Glasgow. The water-power scheme was designed and supervised by Messrs. Formans & McCall,

The Electricity Supply Scheme.

Views from Various Quarters.

Cheap and Abundant Electricity: Is Centralisation the Way?

By "RUSTICUS."

For the past six years we have been hearing about the backwardness of electricity in this country, and we have been persistently told that centralisation, standardisation, and interconnection are the only means by which this can be corrected.

I believe it is a fact that if any commercial enterprise will persistently advertise its particular product to a sufficient extent, and will monopolise the front sheets of the daily papers for a sufficiently long period, the product in question will become a household word, although it may be no better than many similar, but less advertised, commodities. I am inclined to think that this is what has happened over the centralisation of electricity supply. Have the many committees and commissions which have considered the matter really come on the scene unbiased, or have they approached the matter with the firm conviction that the super-station is the only solution? Have any of them started with a clean slate and considered all alternatives? Broad and sweeping statements of what a particular party proposes to do may be excellent for political purposes, but, to put it vulgarly, do they cut any ice when reduced to concrete facts?

I am interested in the question of electricity supply in a small agricultural town, and as rural electricity supply has attracted a great deal of attention lately, perhaps I may be pardoned if I bring our own case forward as a concrete example.

The small town in question, which I will call B, decided two years ago that it wanted a supply of electricity. At a distance of 18 miles a town A had an enterprising and successful electricity undertaking, which was approached with a view to obtaining a bulk supply. A has recently installed additional plant at a cost of £18 per kilowatt, and the new plant will probably result in a fuel cost per unit of 0.3d. The town B, in the course of three or four years, will probably require 1,000 kW. The cost of the transmission line was estimated at about £60,000. Reckoning interest and repayment at 8 per cent., A's annual charge per kW for generation only will be £1.44. The capital charges on the transmission line will be £4,800, and if we spread these over 1,000 kW (which will not be the case for the first few years), there will be £4.8 to add to the generation cost, making £6.24 per kW at B. The price which A would have to quote at B would therefore be in the neighbourhood of £7 per kW and 0.4d. per kWh, and even on these terms B could not be regarded as a very profitable consumer, particularly as A would have 18 miles of transmission line to look after.

Under these circumstances B was forced to look into the cost of making its own electricity, and finds that it can install internal-combustion engines and alternators complete with land, buildings, and all accessories at £25 per kW, which at 8 per cent. as before gives an annual charge of £2 per kW, or allowing for one-third of the installed plant being stand-by, £3 per kW for peak-load purposes. From the experience of existing internal-combustion stations, the fuel cost per kWh should be below 0.4d. (say, 0.7 lb. of oil at 85s. = 0.32d. per kWh).

Evidence in favour of B's generating its own supply was therefore overwhelming, and B has now received instructions to go ahead with its station.

It may be argued that with the bulk supply and transmission line the intermediate villages would have taken supplies, and that this would have altered the financial aspect of the case. On investigation it will probably be found that the revenue from a village, after covering its own distribution costs and the costs of its transformer station, will leave nothing to contribute to the costs of the main transmission line.

With reference to the foregoing, the policy outlined at Birmingham on Friday, January 15th, is of interest, explaining the intentions of the present Government with regard to electricity supply. This policy, applied to our particular case, introduces a third party or middle-man, described as an "Electricity Board," which we will describe by the letter C. Under the suggested arrangement C will buy energy from A, will provide the transmission line from A to B, and will sell energy to B. I cannot understand how this is going to improve the financial aspect of the case—rather I am afraid it will add a further expense. C is to be guaranteed, but not subsidised by Government funds, and therefore its only source of revenue will be the difference between the price at which it buys from A and sells to B. Now out of this revenue it has got to provide the charges on the transmission line and *its own expenses*. It is also apparently going to provide 10 millions for standardisation of frequency, and is then in a few years going to have millions to spare to distribute as a sort of bonus to B and similar consumers. It seems to me probable that by that time B will have contributed more to the general fund than it is ever likely to see back. As a rule the introduction of a middle-man does not reduce the price paid by the consumer, and I fail to see how this case is going to be any exception to the rule.

We have heard a lot about the parochial spirit lately. Perhaps this has been exaggerated. Supply station engineers as a rule know their business, and would not object to being relieved of the worry of a generating station if the bulk supply offered them were at terms as good as they could hope to reach themselves *with improved plant*. At the same time, a great many of them appreciate that centralisation, if carried to anything like the extent suggested, will not bring with it advantages commensurate with the enormous expense that transmission lines involve.

We hear a great deal about the small and inefficient stations. Has the cost of making these efficient ever been gone into and compared with the cost of the super-stations, plus that of the transmission lines? Also is their present relative inefficiency in any way due to the fact that loans for new plant, which might have made them efficient, have been consistently withheld for years past? In any case the Birmingham announcement admits that more than half of our electricity supply is already being turned out by highly efficient stations. Is it worth spending 10 millions on the standardisation of frequency, plus the cost of transmission lines, plus the expenses of an Electricity Board, in order to reduce the cost of production of less than half of our output?

Standardisation of frequency without interconnection is an unnecessary expense. It would surely therefore be well to look very closely into the results already obtained by the interconnection of large stations before spending on standardisation a huge amount which without interconnection must be regarded as an unproductive expenditure. Have any great economies in stand-by plant been made by interconnection after taking into account the cost of transmission lines, voltage regulation, &c.? Parallel running means power-factor complications and also extends the area affected by faults. In some cases I believe it is considered that these disadvantages more than cancel the advantages.

We all appreciate that standardisation of frequency would provide a great deal of work for our manufacturing firms, but when completed it will not increase the revenue from electricity supply, and except from the doubtful economies to be obtained from interconnection

it would in no way cheapen generation. Would not a similar amount spent in encouraging electricity supply in districts not yet provided for be far more productive? It would give just as great an impetus to the manufacturing side, and would lead to increased output on the generating side.

The future of electricity supply depends entirely, I believe, on the cost to the consumer. Reduce this cost and you at once open new markets. These mean increased production and better load factor, which again react on the cost of production, and so on to the all-electric age. Let us by all means adopt centralisation so far as it can be proved to be economic, but let us have a fair field for the small station. I recently canvassed a prospective consumer to take a public supply in preference to running his own somewhat antiquated plant. Naturally I tried to keep the argument to his present costs. "No," he replied, "I am going to argue on the cost of the most economical plant I can put in *now* to meet my present requirements." I had to agree with him. If those in authority will adopt the same plan with regard to the small stations I do not think we shall go far wrong.

By the way, I was recently informed that a private individual had just put in an internal-combustion engine and was making electricity in the shadow of the latest super-station because he could save money by so doing. This does not look very well for the prospect of the super-station at a 50-mile radius, and leads one to believe that the modern internal-combustion engine will go a long way to alter the outlook with regard to the small station if given a fair field.

Why not a Commission to look into the desirability of a system of small stations, probably 12 miles apart, each serving a 6-mile radius with light high-pressure mains which could diminish in size as they approached the boundary radius?

National Electricity Supply.

By F. J. MOFFETT, B.A., M.I.E.E., M.Cons.E.

THE proposals of the Government with reference to the "cheap and abundant" supply of electricity, about which rumours have long been floating in the air, have at length crystallised: their scope was described by the Prime Minister in his speech at Birmingham on January 15th.

The proposals in brief appear to be as follows:—

(1) The generation of electric power is to be concentrated, as far as possible, in a comparatively small number of what are usually termed super-stations.
(2) All these super-stations are to be interconnected by heavy trunk lines, so that they will be able to mutually assist one another.
(3) In order to allow of this being done throughout the country, the frequency is to be standardised at 50 periods.
(4) All small generating stations are to be closed down as soon as possible, or converted into distribution stations.

I believe many leading electrical engineers will agree with me that in the main these proposals are entirely on the wrong lines, both from the technical and the economical points of view.

We are told that the super-station will be able to generate more economically than the smaller station, owing both to the large size of generating units and also to the improved load factor. There is no doubt that the super-station can usually generate at a lower works cost per unit than the small station, though this is not always true. Several cases could be quoted where a small station can show better works costs than the larger station.

But the works costs are not everything. The electricity has to be carried to the house of the consumer or to the factory, and the losses in distribution are roughly proportional to the distance through which the electric power is transmitted. Further, a large part of the total cost per unit is due to the capital charges—in other words, to the interest and depreciation (or sinking-fund payments) on the money invested. If this is increased to a considerable degree by the expenditure of huge sums on interconnecting extra-high-pressure cables, transformers, switchgear, and other accessories, and also by the heavy expenditure rendered necessary to standardise the frequency, the total cost per unit will be brought up to a figure of which the works cost will form only a moderate proportion.

One of the advantages of this interconnection of the large generating stations is stated by the Prime Minister to be the improvement in the load factor which would be effected thereby.

The load factor of a generating station depends on the number of hours during which the plant is usefully employed, and this depends eventually on the number of working hours in the factories which derive their electric power supply from that station. In the early days of electricity, when the load was chiefly lighting, the load factor was very low, but the enormous increase during the war in the amount of energy used for driving machinery has increased the load factor owing to the longer hours over which electricity is required for power purposes.

I entirely fail to see how the load factor of the Birmingham area can be improved by interconnecting it with the Manchester area, for instance. The working hours in Manchester are very similar to those in Birmingham, and the load factors in the two areas are almost identical.

By the advent of such a load as would result from the electrification of the railways, the load factor would be greatly improved, since the demand from the railways would cover a good proportion of the 24 hours of the day.

The president of the Institution of Electrical Engineers in his presidential address, delivered in October, 1925, deprecated the interconnection of the chief supply centres, and pointed out that the cost of standardising the frequency over the whole country would be something like £27,000,000. To this would have to be added a sum of the same order to cover the cost of the "interconnecting trunk mains and other necessary apparatus." The total cost for the whole country for interconnection and standardisation of frequency would probably be in the neighbourhood of 40 to 50 million pounds.

I understand that the National Scheme is to be worked without placing any burden on the National Exchequer. The new Board which is proposed is to be authorised to obtain loans on a Government guarantee, but where are the interest and repayment charges on such a large sum to be obtained from?

They can only be recovered by adding the appropriate proportion to the price charged per unit, or as a maximum-demand rate. I fail to see how this will assist in the cheap supply of electricity.

Doubtless manufacturers of electrical plant of every kind will be disposed to look with the eye of favour on the Government proposals, since if carried into force, they would mean an era of unexampled prosperity for them. But manufacturers of electrical plant are also citizens of this country, taxpayers, and ratepayers, and they will, I feel sure, look at the matter from the national standpoint as well as from that of inflated profits for their firms.

Finally, all small generating stations are to be closed down on account of their being unable to generate at as low a works cost as the super-station.

I have recently been contending in the public Press that we are quite on the wrong lines in devoting all our energies and efforts to the advancement of the "all-electric" generating station, which has at most a thermal efficiency of 20 per cent. and an average efficiency of only 15 per cent., considering the figures for comparatively large modern stations only. It is practicable to increase the thermal efficiency to 50 per cent., or even 60 per cent., by combining the supply of heat and electrical energy.

There are no serious engineering difficulties in the

design and erection of combined heat and electricity supply stations, or "heat-electric stations," as I suggest they should be called, and no obstacles to their success provided the right conditions are chosen.

For household purposes hot water is of prime importance—it is far more essential than anything else. No householder can live without it. For cleaning, cooking, and baths it is indispensable, while for the heating of rooms its advantages are generally recognised. Why not supply hot water as well as electric current, particularly when, by so doing, electricity can be supplied at a cost far below that possible in the case of supply from the present standard "all-electric" supply system?

America in particular, and Germany to a certain extent, have made progress on these lines, and since the "heat-electric" principle rests on an absolutely sound basis, I feel no hesitation in stating that we, as a nation, will make a huge mistake if we do not seriously consider this means of reducing the enormous waste of fuel that is taking place in our present all-electric super-stations.

Instead of scrapping the small generating stations, I strongly urge that they should be converted into heat-electric stations for the simultaneous supply of hot water and cheap electricity to the residences and factories situated in the neighbourhood.

I believe that the adoption of this course would involve greater activity on the part of manufacturers of many engineering products, such as pipes, &c., besides bringing considerable grist to the mills of the electrical industry both in connection with the conversion of existing small "all-electric" stations and in the equipment of new "heat-electric" stations.

The electrical current for such "heat-electric" generating stations would be a secondary product, the primary being hot water. For this reason the cost per unit could be brought down below that obtainable under the all-electric system unless it relied for its power to supply electricity cheaply on a Government subsidy.

In conclusion, I trust sincerely that all electrical engineers will look at the question from a national standpoint, not from the angle of personal profit, and use their best endeavours to prevent legislation on the lines laid down by the Prime Minister from being carried into effect.

Some Published Opinions.

Sir HUGO HIRST, in the *Financial News*:—"Small scale enterprise might have been suitable for pioneer development in the early stages of the industry, but such a system is uneconomical under present conditions, and standardisation and closer working are necessary for the production of cheap electrical power. Co-ordination by a central authority of both production and distribution of electrical energy is vitally needed. Through the standardisation of voltages and frequencies," said Sir Hugo, "electrical manufacturers in this country will at last be able to lay themselves out for mass production.

"The effect of mass production will be that the cost of industrial and domestic labour-saving appliances will be so cheapened that I predict a great expansion of demand, which must inevitably have a reflex action on other industries which supply the raw materials required by the electrical industry.

"So vast a scheme cannot, of course, be put into operation in one year. There must be a gradual development, and, in my opinion, the scheme will provide an opportunity for the solution of some of the problems of the coal industry. While it will involve the setting up of a number of super-stations, I visualise—if the coal situation is handled to the satisfaction of both parties—a grouping of pits large enough to allow central stations for each group of mines. These will provide supplies of electricity and gas which will be transmitted to industrial areas by means of the omnibus mains contemplated by the scheme. Electrical power can be produced at so cheap a rate at mining centres that it would not only be a paying proposition for the mines, but it would reduce also the average cost of production per unit throughout the country. The waste gas from the blast furnaces could be utilised in a similar manner to generate electricity.

"Finally," he concluded, "I hope that it is the Government's intention to preserve the benefits of the scheme for British industry. It will not help us much if other countries with a lower standard of living and depreciated currencies are allowed to reap the advantage. Wherever Government facilities and support are given, the bulk of the production should be for the benefit of British labour."

Dr. J. F. CROWLEY, in the *Yorkshire Post*:—"There is naturally a great deal to be said from a national point of view for having one standard frequency throughout the country. It would facilitate the manufacture of electrical machinery, but one may pay too dearly for the latter advantage. Interconnection facilitates concentration of generation, and it is undoubted, and was indeed pointed out by the Electricity Supply Committee of 1918, and by the Coal Conservation Sub-Committee on the same subject, that concentration of generation in large stations, where the circumstances justify it, means comparatively cheap generation.

"There are, however, very definite limits to the advantages that can accrue in this direction, and one may well venture to doubt whether the heavy costs involved in the changing over of frequency over wide areas will, in our generation at any rate, justify the expenditure involved.

"One thing is, however, certain, and that is that the cost of the changes over should be borne by the State, and not by the present consumers, the benefit to whom will be more than problematical. As regards interconnection, there is in general no question in the minds of power engineers that concentration of generation in reasonably large stations is desirable, and should be carried out in the national interest.

"This was the intention of the Electricity Supply Committee when it formulated the District Board method, and it is, in the writer's opinion, very much to be regretted that the local authorities and companies in each of the delimited areas could not have made common cause in the national interest.

"It is, however, a matter for congratulation that the Government proposes to retain to a large extent the advantages of private enterprise in electricity generation, and where it exists and operates successfully, of municipal ownership also.

"The proposed Board is not to be an elected body, as in the proposals submitted to the Royal Commission on the Coal Industry by the Miners' Federation during the last few days, but a nominated Commission of men with commercial and administrative experience on the lines of the Mersey Harbour Board, or of the Port of London Authority.

"Commissions or Committees responsible to an electorate are in universal experience at a grave disadvantage in the conduct of commercial undertakings. If such bodies are to deal successfully with commercial business, they must have security of tenure, and be independent of undue pressure with regard to all matters that may come before them for decision."

Sir PHILIP DAWSON, in the *Morning Post*:—"The essence of the national electrification scheme is the co-ordination and co-operation of power stations," said Sir Philip. "When this has been accomplished a tremendous reduction of running costs and capital outlay for new stations will be possible. The co-ordination of power stations will enable individual stations to dispense with an immense amount of plant which has to be kept for emergencies. If all the stations are linked up, only a small emergency equipment will be necessary.

"Experience has shown that in other countries where electrification has been extensively introduced, the gas industry has not been affected. I believe that in the future the gas and electrical industries will work in close co-operation. It will, I think, be found necessary within a few months to adopt a process of low-temperature distillation of coal. The result will be that wherever there are electrical power stations there will be gas generating stations and chemical works. When the coal has been distilled, the gases will be distributed for use as gas, the fuel will be used for heating boilers in the electrical power scheme, and the hydro-carbonates which will be yielded as by-products will be utilised by chemical factories on the spot.

"I am greatly in favour of the standardisation of frequencies and pressures. Standardisation will allow electrical appliances of all sorts to be produced at much less cost than at present, and it will also allow any one appliance to be taken from house to house.

"I am absolutely antagonistic to nationalisation in any form, and should oppose any suggestions of subsidies or subventions. I am sure that if proper facilities in the form of an expansion of the Trade Facilities Act are given, we have sufficient enterprise to do it without any such help."

PROF. GEORGE FORBES, in *The Times*:—"The difficulty, involving at first sight enormous expense, is that the standard frequency for light and power distribution in this large scheme must be 50 cycles per second; the voltage must also be standardised. In Birmingham, to take one example (and so it is in Scotland), we find an enormous area supplying electric current at the power-rate of 25 cycles per second. It has been asserted that in these areas all the generators and all the transformers, besides other items, must be scrapped at enormous cost and replaced by others made for 50 cycles per second in order that they may all feed into the same network for the whole country.

"It is now suggested as a more economical policy that such areas shall continue to be supplied as at present at 25 cycles, but the connections of their own mains to the general network of the whole of Britain shall be made through motor-generators, which shall receive energy at 25 cycles and give it out at 50 cycles and the standard voltage, or *vice versa*, according as Birmingham has at the moment an excess or a deficit of supply for its own wants. This item of cost may thus be reduced from millions to thousands of pounds."

Legal.

Charge of Fraud.

AT Darwen, on January 21st, Richard Haworth, electrical engineer, Richmond Terrace, was summoned for fraudulently obtaining money from Mrs. Mary Eccles. It was stated that defendant had done work at the lady's house and had made a wireless set for her brother. He was asked to quote for another one, and his price was £17. He was given £13 with which to buy the material. Later he was given £4 in advance for a £7 cabinet. Defendant's contention that the money was in part payment for a bill for £54 for electrical work, &c., was denied by the complainant, who said she had paid defendant over £66 for electric light, wireless, &c. Subsequently she learnt that defendant was an undischarged bankrupt. Defendant denied the allegations made, and said that he had rendered service for money paid. He was fined £5 and £4 4s. costs. Other charges were withdrawn.

Mullard Radio Valve Co., Ltd., v. Orgel.

MR. JUSTICE RUSSELL, in the Chancery Division on January 22nd, had before him a motion against Hy. Orgel, of Bishopsgate, to restrain the defendant from infringing a patent valve of the plaintiffs.

For the plaintiffs, Mr. K. E. SHELLEY intimated that it had been agreed to treat the motion as trial of the action. The defendant said he was innocent. The plaintiffs did not ask for damages. The defendant would pay £5 as agreed costs and submit to a perpetual injunction.

The judge sanctioned this agreement.

Mullard Radio Valve Co., Ltd., v. Braham.

IN the Chancery Division on Tuesday, before Mr. Justice Russell, the Mullard Radio Valve Co., Ltd., moved to restrain an infringement of letters patent by John Braham, of Bishopsgate, E.C. Counsel for defendant consented to a perpetual injunction against him and this was granted, it being also agreed to treat the motion as the trial of the action.

Theft of Electricity.

AT Pontypool on January 16th, William T. Hales, described as an electrical engineer, was charged with fraudulently abstracting electricity from the mains of the Pontypool Electric Light and Power Co. It was stated that the defendant had short-circuited the meter in his house, the value of electricity so taken being estimated at £17 9s. The defendant stated that he carried on a battery-charging business and found that the five-ampere meter fitted would not stand the current which he required. He alleged that he had the authority of the manager of the supply company to shunt the meter to avoid burning it out. It was denied that this authority was given, and the magistrates imposed a fine of £10.

False Pretences Charge.

AT the Old Street Police Court on January 19th, Charles Frederick Kidby, 29, gramophone dealer, Rushcroft Road, Brixton, and Alfred Sidney Taylor, 42, engineer's fitter, Stoke Newington, were charged on remand with being concerned together in knowingly obtaining by false pretences a quantity of wireless goods, value £44 8s. 4d., from Ernest Edward Rooke, with intent to cheat and defraud, at 7-9, City Road, E.C. In opening the case, Mr. Clayton had stated that there would be also charges of conspiracy and further charges of obtaining goods by false pretences. The men had been trading as a company, C. F. Kidby, Limited, with premises in City Road. Mr. Singleton appeared for the defence. A clerk in the Company Record Department, Somerset House, produced the file of C. F. Kidby, Ltd., which was registered on January 30th, 1924, with a nominal capital of £1,000, divided into 1,000 shares of £1 each. The two defendants were the directors of the company, and Kidby was also the secretary. Two subscribers' shares only had been subscribed. The registered office was at City Road.

MICHAEL PAPIER, proprietor of the firm of M. Papier, general merchants, Westminster Bridge Road, said that in April, 1924, they commenced doing business with Kidby, Ltd. The amount owing to them was £113 5s.

JOHN WILLIAM AVERY, chief cashier to Thompson, Diamond and Butcher, Farringdon Road, E.C., said that £20 was owing to his firm for violin sets.

Further evidence showed that amounts were due to M. and A. Wolff, general merchants; Hobdell, Way & Co., engineers, for ebonite; and Jack Mills, Ltd., Regent Street, for wireless sets.

Mr. SINGLETON asked for an adjournment of the case as he thought evidence should be presented before the magistrate that it was a genuine business. Unfortunately last year the defendants had had a succession of losses. A further remand was ordered, bail being renewed.

Attorney-General (St. Pancras Corporation) v. County of London E.S. Co., Ltd.

MR. JUSTICE TOMLIN, in the Chancery Division on January 20th, reserved judgment after hearing at great length the arguments in the case of the Attorney-General at the relation of the St. Pancras Corporation against the County of London Electric Supply Co., Ltd. (*vide* our last issue, p. 131).

The plaintiffs claimed an injunction restraining the defendants from supplying outside their statutory area electrical energy to part of the property of E. Hulton & Co., Ltd., Gray's Inn Road, W.C., on the ground that the property in question was within the Corporation's area of supply.

The defendants denied that they were intending to supply outside their area, or that the Corporation had always been ready and willing to supply energy on reasonable terms. Alternatively, if they had committed any breach (which was denied) defendants said that the Corporation was not entitled to the relief for which it asked, because if any breach had been committed the Electricity Commissioners were the only authority who could deal with it.

Correspondence.

Correspondents should forward their communications **at the earliest possible moment.** *No letter can be published unless we have the writer's name and address in our possession.*

Electrical Showrooms.

The recent article by Mr. W. A. Gillott, A.M.I.E.E., was of great interest to me and also, I hope, to a large number of readers. Mr. Gillott remarks that "there are comparatively few really good showrooms in existence." I thoroughly agree with him.

For several years I have been interested in, and connected with, the development of electricity showrooms and exhibition work. There is a great art in this work if it is to be a success.

Personally, I think that every employé for the work, whether male or female, no matter how young, should first of all learn the current consumption of the various appliances, the meaning, for instance, of the mark "200 Watts" on a flat iron, and explain to a customer that as 1,000 watts equals one unit consumed per hour, the iron would consume one-fifth of a unit per hour; and again, point out that, assuming the rate is 2½d. per kWh, the cost of using the iron would only be one half-penny per hour.

A few simple explanations of this nature, giving definite facts showing how economical the various domestic appliances are to use, would, I am sure, result in larger sales.

Another point which is often overlooked, especially in exhibitions, is the lady demonstrator's clothing. I remember at one exhibition about four years ago seeing a lady demonstrating an electric washing machine. She looked very far from what she was supposed to represent—a happy young housewife enjoying the ease of an electric wash day. Instead, she wore a dark print frock with a still darker overall and, with sleeves rolled up and somewhat bedraggled hair, she looked, as an onlooker expressed it, "too much like home."

I do not advocate dressing-up for the occasion, but I do say: Look neat and attractive and demonstrate with ease and confidence, and the article is already half-sold.

Passing through a large provincial town a few days ago, my attention was drawn by huge placards: "Electricity for Cleanliness and a Healthier Home." On approaching the windows of this beautifully situated showroom, I was dismayed at the utter neglect; not only were the articles badly displayed, with flat irons apparently being heated on boiling rings, but, worst of all, everything was dusty and unpolished. Of what use then the placards?

An electrical showroom should be decorated with care, kept scrupulously clean and the appliances bright and shiny. Even the tiniest of showrooms can be very attractive with very little expense. I opened one in a small town and was congratulated by many for its attractiveness.

It is up to every supply authority to have a showroom, the finest form of advertising and, most important of all, a tremendous help, as Mr. Gillott remarks, "to fill up the valleys" which, to my mind, is more important than many engineers realise.

Ethel Prentice.

Stowmarket, *January 19th*, 1926.

The Metering of Three-phase Power.

Mr. H. H. Jaques states that the condition $e1+e2+e3=0$ will only be fulfilled if:—

(1) The voltages are exactly equal.
(2) They are exactly 120 degrees apart.
(3) They are pure sine waves.

I do not agree, and if Mr. Jaques will go more thoroughly into it he will realise that if, for instance, E1 and E2 were vectorially equal and opposite, and E3 was zero, the condition $e1+e2+e3 = 0$ (where $e1$, $e2$ and $e3$ are instantaneous values taken at any and every instant during a complete cycle), would be satisfied and a 3-phase, 4-wire, 2-element meter would correctly register the energy. Again, if E1 and E2 were each, say, 100 volts, and were in phase with each other, while E3 was 200 volts and displaced 180 degrees from E1 and E2, the condition $e1 + e2 + e3 = 0$ would be met. I mention these two extreme conditions as samples; more normal departures from the conditions of equal voltages 120 degrees apart may be dealt with in the same way, and provided the vector sum of the voltages is zero (E1 + E2 + E3 = 0) the sum of the instantaneous voltages will always be zero, namely, $e1 + e2 + e3 = 0$. Thus we see that the voltages need not be exactly equal nor need they be exactly 120 degrees apart.

With regard to the shape of the voltage waves, the actual shape is immaterial provided that $e1 + e2 + e3 = 0$. The in-

troduction of 5th, 7th, 11th, &c., harmonics, corresponding harmonics in each phase having the same percentage of its fundamental will not affect this relation. In a 3-phase transformer having a delta primary any resultant voltage in the delta would be practically suppressed just as the 3rd harmonic is suppressed; thus in the primary winding the condition $e1 + e2 + e3 = 0$, is enforced by the nature of the circuit, and provided the ratio of each phase is the same the condition $e1 + e2 + e3 = 0$ is also obtained on the star-connected secondary of the transformer, and we obtain accurate results on a 2-element, 3-phase, 4-wire meter, as the figures I gave in my last letter showed.

With reference to paragraph 57 of the B.E.S.A. meter specification I have shown that a 3-phase, 4-wire, 2-element meter will register accurately without requiring currents or pressures to be symmetrical as regards magnitude or phase angle.

A Meter Superintendent.

January 25th, 1926.

How Will "Government" Electricity Affect us?

The letter from Mr. L. L. Robinson in your issue for January 22nd goes to show that the public cannot, and must not, expect to obtain electricity at a very much (if any) lower rate under the new scheme than at present.

If this be so as regards such a district as Hackney (I quite agree with Mr. Robinson), how much more so will it be in the case of the small outlying towns.

As an instance, we here are supplying electricity at the following rates:—Lighting 9d., heating and power 3d., cooking 1½d., or on the Dundee Tariff at 8s. per 100 sq. ft. of floor area plus 1½d. per unit for all purposes.

If we were to take a bulk supply, the standing charges due to our small output of 180,000 units per annum and the length of the necessary transmission line would be round about twopence per unit, to which must be added the cost of energy in bulk at, say, 1d. per unit, *i.e.*, total 3d. per unit purchased. How, then, could we continue to sell at 1½d. per unit?

Conditions in this country are vastly different from those obtaining in America and Canada, and, whilst the Government scheme from an engineering point of view may be practicable, from a financial point of view it is one in which I should be sorry to be interested, and must surely operate to the disadvantage of the public.

C. Culmer Hodges, A.M.I.E.E., A.M.I.Mech.E.

Electricity Works, Dawlish,
January 25th, 1926.

Situations Vacant.

Having recently had cause to seek employment, I have replied to several of the advertisements in your paper, and although in every case I enclosed a stamped envelope, I have not had the pleasure of one acknowledgment.

If each applicant has had a similar experience, then advertisers must find this a paying proposition.

Is there not any way in which this kind of thing can be stopped?

May I venture a further suggestion with regard to advertisements of situations vacant, and that is the inclusion of the name of the town or district? This would save many from applying, where distance alone precludes any chance of being selected.

I trust my remarks will receive some consideration at your hands.

Blackpool, *January 20th*, 1926. **John Frame.**

We have received a letter from Mr. J. C. Elvy on "An Electric Vehicle Association," too late for inclusion in this issue.

Business Notes.

Commercial and Industrial Developments, Business Changes, Trade Opportunities, New Publicity Literature, Liquidations and Failures.

Birmingham Electric Club.—Mr. A. E. Cunningworth, in his presidential address to the Birmingham Electric Club last Friday evening, spoke of the present position and prospects of the electrical industry. He said that electrical power must be sold at a fraction of the present price. This could not be until the power-station engineer could buy machinery, &c., at a very much lower price than at present. The whole of the machinery needed speeding up. The improvement to the alternator during recent years had been very slow. The Electricity Commissioners had assisted matters by adopting 50 cycles. The super-power station of the future had great potentialities if developed on proper lines.

Dust Collectors at Birmingham.—The Birmingham Corporation recently ordered 19 flue dust collectors from Messrs. Davidson & Co., Ltd., Belfast, and it has now placed an order for a further 12. It is calculated that each of these collectors takes up 49 lb. of dust per hour, and thus Birmingham will free the atmosphere of 5,000 tons of dust a year when the whole of the collectors are in operation.

Electricity Supply Workers' Wages.—At a meeting of District Council No. 2 for the Electricity Supply Industry (Yorkshire, &c.), on January 13th, an application was submitted by the trade union side of the Council for an increase of 1d. per hour in the wages of all grades in the Council's schedule and for the general payment of double time on Sundays. The claim was based on the ability of the undertakings to pay the increased rates. The employers' side decided that the prosperity and ability of undertakings to pay the increased rates were not adequate reasons for a rise. It was considered that the wages at present paid in the supply industry were sufficiently high having regard to the level of wages paid in other industries. No settlement was reached in the matter.

The employés represented upon the District Council No. 10 (Greater London) for the Electricity Supply Industry recently claimed an increase of 10s. per week in their wages. This claim was referred by the National Joint Industrial Council to a final appeal court consisting of five representatives appointed by the employers' side of the No. 10 District Council and five appointed by the trade union side, with an independent chairman (Mr. C. P. Sparks). At a meeting held on January 11th, the Court unanimously came to a decision to award an advance of 6¼ per cent. on the existing total rates of pay to all manual workers within the scope of the "London Agreement" of January 18th, 1921. It is provided that the total rates of pay shall not include overtime, and the 6¼ per cent. shall be fixed on the present rates of pay, and shall not be varied according to the cost of living. The advance was to come into force for the first full week following the date of the award (January 15th), and is to continue until determined by three months' notice from either side.

Lead.—Reporting on January 23rd, Messrs. James Forster and Co. said that the demand from consumers in this country still left much to be desired. The main strength of the lead position continued to be derived from America. Conditions in Germany seemed to be going from bad to worse, and the revival in demand from consumers in this country confidently expected in January had not so far materialised.

The Holophane Lighting System.—It is stated that the Holophane lighting system is now in use in 500 towns in all parts of the world. The bulk of these towns (298) are in the United States.

Suggested Shipbuilding Subsidy.—At a recent conference in Newcastle representatives of a number of trade unions associated with the shipbuilding industry, including the Electrical Trades Union, decided to bring before shipbuilding employers and others affected the question of a subsidy or other Government assistance for the shipbuilding industry.

Copper, Lead and Rubber Prices.—Messrs. F. Smith and Co. report, January 26th:—No change in electrolytic copper prices. Messrs. James & Shakespeare report, January 26th:—Copper bars (best selected), sheet and rod, no change; English pig lead, £30 10s., 5s. dec. Messrs. Edward Till & Co. report, January 26th:—India-rubber, Para fine, 3s., 2d. dec.

Electricity in Tin Mining.—Speaking at the recent annual meeting of Rahman Hydraulic Tin, Ltd., Col. C. Rae, the chairman, said that in order to complete the company's hydro-electric scheme, a further $500,000 would be needed owing to the necessity for stronger foundations.

The Importance of Turnover.—In the course of some notes on the contractor-dealer's business *The Electragist* (New York) says that the measure of profit in a business greatly depends upon the movement or turnover of the invested capital. It is shown that if the turnover on an investment is 1.5 times per annum, the net return, on a 6 per cent. basis, is 9 per cent. If, however, the turnover is increased to 1.7 times, the net return, on the same basis, is increased by 13⅓ per cent., while if the figure is 2, the increase is 33⅓ per cent. A turnover of 12 times increases the original profit by 700 per cent., giving an annual net return of 72 per cent. on the investment.

Social Events.—The first annual dinner and smoking concert of the West Gloucestershire Power Co., Ltd., was held at the Swan Hotel, Lydney, on January 16th. The general manager and chief engineer (Mr. H. S. Ellis) presided over a gathering of about 85. Mr. W. A. H. Parker proposed the toast of the company, and the chairman, in replying, outlined the good progress made by the undertaking for the first complete year's working.

The annual social gathering of the staff and friends of Messrs. Robson & Coleman (Newcastle) took place on January 15th, about 120 attending. Two whist drives were held, the prizes being given by Mr. and Mrs. Robson and Mr. and Mrs. Lowrey. Mr. N. B. Ridley gave prizes for dancing. Mrs. Robson presented the prizes.

The Igranic Electric Co., Ltd., held its annual carnival dance on January 15th at the Café Dansant, Bedford, where a party of 500 danced from 8 p.m. until the early hours. A large majority of the dancers were in fancy costume, and 20 prizes were awarded by a special judging committee, the prizes being presented by Mrs. Curtis. Among those present were Messrs. G. A. Mower, A. H. Curtis, J. T. Mould, and A. Thornton, and contingents from the London, Birmingham, Manchester, and Leeds offices.

Turkish Tax on Electricity.—The Budget proposals of the Turkish Government for the next financial year include a tax of 10 per cent. upon the consumption of electricity and gas.

Calendar.—We have received a novel "perpetual" calendar from the Union Cable Co., Ltd. The day and month appear in openings near the top, while the date is indicated by a pointer upon a dial. The centre of the dial consists of an illustration of some of the company's cable products.

Remission of Australian Duty.—The Tamworth (N.S.W.) Municipal Council recently ordered a large electricity generating plant from England, and it was found that under the new tariff schedule the duty upon it would amount to £1,100. The Council objected to such an imposition as every effort had been made to obtain the plant in Australia but without success. The Minister of Customs therefore remitted the duty, stating that he was sympathetically disposed towards country municipalities which were endeavouring to provide improved facilities for their citizens. If they had failed, after inquiry, to obtain supplies locally they were entitled to every possible concession.

Hungarian Industrial Progress.—The Mid-January *Review of Central Europe* published by the Anglo-Austrian Bank, Ltd., quotes statistics as to Hungarian industry compiled by the Hungarian Statistical Office. These show a tremendous increase since 1913, particularly in food-producing industries. The machine and electrical industry was represented by 229 factories in 1913; in 1924 there were 301, an increase of over 33 per cent. The average production per factory, however, declined from 1.10 million gold crowns in 1913 to 0.52 million crowns in 1924, and the average output per worker from 5,370 crowns in 1913 to 3,415 crowns in 1924.

The British Industries Fair.—The Fair authorities have published a list of exhibits specially designed to supplant articles of foreign manufacture, or as a direct challenge to foreign competition. Included in the list are wireless terminals and accessories, vacuum self freezers, electric motors suitable for any climate, electric switches, coal pulverisers, phenolic condensation products, *e.g.*, mouldings and impregnating varnishes, electrically-propelled one- and two-ton trucks for factories, special compact radio components, magnetic separators, and electric lampholders and wall plugs.

Argentina's Electrical Imports.—From statistics contained in the annual report of the British Chamber of Commerce in the Argentine Republic, it appears that the imports of electrical machinery and material into Argentina during the first six months of 1925 were valued at 31,988,077 gold pesos, as compared with 23,285,036 pesos in the first half of 1924.

Employment During December.—The *Ministry of Labour Gazette* states that employment in the engineering industry during December was again bad on the whole, especially in the marine section, although there was a tendency to improvement. In the electrical section employment remained fairly good. The "overall" proportion of unemployed in the engineering industry was 11 per cent. In the marine section it was 25.2 per cent., while in electrical engineering it was only 5.1 per cent., a decrease of 0.5 per cent. in a month. The percentage of unemployed in the electrical wiring and contracting industry was 6.7, an increase of 0.2 per cent.; in the electric cable, wire and lamp manufacturing industries the figure was 5.5 per cent., an increase of 0.1 per cent.

An All-Electric Restaurant.—Within a stone's throw of our offices, at 33, Ludgate Hill, E.C.4, the City of London Electric Lighting Co., Ltd., has opened an all-electric restaurant and showrooms. Upon the ground floor a display of all kinds of electrical appliances has been arranged, including domestic and business apparatus, while part of the restaurant is at the rear. In the basement is the other half of the restaurant—a very clean, neat and comfortable room, and the kitchen and store-rooms. We hope to say more regarding the new premises at a later date. For the present we must content ourselves with saying that they are well and tastefully lighted and decorated, and everything, including the time-keeping, is carried out electrically.

Works Visit.—A party of South African students who recently visited this country included the Witton works of the General Electric Co., Ltd., in their itinerary. Mr. R. Orsettich, the company's chief designer, presided at afternoon tea and said that he hoped that what they had seen would make them realise that England was still in a position to deal with contracts of any dimension. Dr. M. Rendl, in voicing the visitors' thanks, said that the students were in Europe to gain first-hand information of the conditions and they had been impressed with the great generosity extended to them everywhere.

Engineering Employés' Wages.—It is reported that London members of the Amalgamated Engineering Union are becoming impatient at the delay in receiving a definite answer to the union's claim for an increase of 20s. per week in the wages of its members. They urge that the employers be again approached on the matter, which was opened in 1924. A meeting of representatives of the union and employers was to be held last Tuesday, but was abandoned owing to the continuance of a dispute between a London printing-press manufacturing company and its employés.

In the meantime a resumption of the national negotiations was to be made in London yesterday (Thursday).

A New "Exide" Poster.—We have received from the Chloride Electrical Storage Co., Ltd., one of its new posters advertising "Exide" high- and low-pressure accumulators for radio work. This is somewhat different from the usual poster, having been produced by a photogravure process which gives a clear-cut sepia picture. The design depicts a happy *ménage à trois*, a cabinet receiving set and "Exide" batteries being given prominence.

Large American Power Merger.—It is reported from New York that the power and lighting companies in New York and the New England States have combined under the title of the North-Eastern Power Corporation. Among the companies represented upon the board of the new amalgamation, which is said to involve a total investment of $5,000,000, are the General Electric Co., the New England Power Corporation, the Mohawk Hudson Power Corporation, and the Power Corporation of New York.

New Italian Companies.—Among the new companies recently formed in Italy in connection with the electrical engineering industry are the Compagnia Lampade Elettriche Nazionale "C.L.E.N.," Milan, capital 200,000 lire, to manufacture electric lamps; la Società per Intraprese Trazione Elettrica, Asti, capital 200,000 lire; la Società per Finanziamento di Imprese Elettriche "La Centrale," Leghorn, capital 1,000,000 lire; la Società Lombarda Applicazioni Elettriche, Voghera, capital 200,000 lire; la Società Italiana Porcellane Elettrotechniche Pohl, Milan, 125,000 lire; and la Compagnia Italiana Strumenti di Misura Milan, 500,000 lire.

New Zealand's Electrical Imports.—Figures just to hand show that the imports of electrical machinery into New Zealand during the third quarter of 1925 attained a value of £435,234. Of the total, £280,917 is attributed to Great Britain, £78,479 to the United States, £19,910 to Canada, £6,312 to Australia, and £68 to Japan.

Trade Announcements.—Messrs. Osler & Faraday, Ltd., have recently opened showrooms at Lanthorne House, 98-100, Queen Street, Cardiff, where Mr. Arthur E. Luen is their representative.

The County of Durham Electrical Power Distribution Co., Ltd., has opened a new showroom and offices at 19, North Road, Durham.

Mr. J. A. Woods, A.M.I.E.E., 7, Stoneyhurst Road, Gosforth, Newcastle-on-Tyne, has been appointed representative of the Vincent Switchgear Manufacturing Co., Ltd., for the North-East Coast.

The business of Messrs. L. Weekes, Ltd., electrical engineers, of Langley Street, Luton, Beds., has been acquired by Mr. T. H. Dryden.

Catalogues and Lists.—Magnum Electric Appliances, Upper Elmers End Road, Elmers End, Kent.—Illustrated price card, giving some particulars of the "Magnum" electric automatic kettle.

The General Electric Co., Ltd., Magnet House, Kingsway, W.C.2.—A comprehensive illustrated and priced catalogue of radio receiving sets, components, and accessories. The publication contains a glossary of radio terms and wiring diagrams. Catalogue Sections S (1) and F (2), dealing respectively with electric lighting supplies and electric light fittings accessories. Both publications are well-illustrated and give full prices. Also a well-illustrated brochure on flood-lighting and a mailing card advertising bells and accessories.

The Sun Electrical Co., Ltd., 118-120, Charing Cross Road, W.C.2.—An illustrated and priced pamphlet dealing with the Marconiphone "Die-Cast" variable condenser.

John W. Barnes, Ltd., Railway Works, Rock Ferry, Cheshire.—Priced pamphlets advertising loose blade reamers and patent floating chucks and straight-shank drills.

F. Hodgson & Co., Ltd., 24, Queen Victoria Street, E.C.4.—A blotter advertising the company's registered contracting business.

The English Electric Co., Ltd., Queen's House, Kingsway, W.C.2.—Publications Nos. 738 and 739, illustrating and describing "English Electric" oil-immersed circuit-breakers, Class "OKB," sizes III, IV, and V.

The Dowsing Radiant Heat Co., Ltd., Bollo Lane, Acton, W.3.—A comprehensive illustrated price list of electric heating and cooking apparatus, "sun baths," and other electro-medical appliances.

Siemens & English Electric Lamp Co., Ltd., 38 and 39, Upper Thames Street, E.C.4.—Leaflet No. Z107, giving illustrations and prices of "Ideal" switches and fuses; and Leaflet No. 147, giving details and prices of "Siemens" neon lamps.

Mr. Alan Wright, Sentinel House, Southampton Row, W.C.1.—A priced and illustrated folder advertising the "Winter" inter-locking switch plug.

The Ernest Sinclair Hoist & Trolley Co., 14, Brompton Road, S.W.1.—A series of illustrated leaflets dealing with leather-tired wheels, vulcanised-fibre, wood, steel, and iron wheels, tramway points, trucks, turntables, hoists, cranes, castors, trolleys, &c.

The Parsons Motor Co., Ltd., Southampton.—Publication No. 77, an illustrated catalogue of marine and stationary oil and petrol engines.

Premier Electric Heaters, Ltd., Keeley Street, Watery Lane, Birmingham.—List No. 79, containing illustrations and prices of new designs of electric fires.

Hans Renold, Ltd., Didsbury, Manchester.—A priced booklet dealing with Renold standard chain drives.

Superlamp, Ltd., 92-94, Paul Street, E.C.2.—A net trade price list of electrical material and accessories.

Private Arrangements.—MAURICE MARTIN, electrical contractor, 23, Royal Arcade, 32, West Street, and Electron House, Kewstoke, all Weston-super-Mare, trading as the D.B.M. Electrical Co.—A meeting of creditors was held recently at Bristol, when a statement of affairs was submitted, which disclosed liabilities of £884 and net assets of £691, or a deficiency of £193. The debtor had employed a manager to conduct the business at a salary of £3 10s. per week, while he himself was holding a position at Bristol. It was stated, however, that if any adverse proceedings, such as bankruptcy, were taken, he would probably lose that position. The debtor commenced business in 1919 with his father-in-law, who died in 1922. At that date figures were prepared showing a credit of capital due to the father-in-law's trustees of about £60. The debtor continued trading on his own, and was successful for two years. During 1925, however, the takings had gradually diminished, and in the last two or three months had seriously fallen off. The debtor stated that the turnover for 1924 was £2,500, and for 1925 £1,900. Several creditors had threatened proceedings. The debtor had no offer to put forward, but stated that he had had several inquiries for the purchase of the business at a price sufficient to clear off the whole of the liabilities. It was decided that the debtor should execute a deed of assignment in favour of Mr. W. A. J. Osborne, of Messrs. Corfield & Cripwell, Balfour House, Finsbury Pavement, E.C. A committee of inspection was also appointed, consisting of the representative of the Sloan Electrical Co., Mr. Griffiths, Mr. Collins, and Mr. W. Eastwood, of Messrs. Simpson & Baker.

Bankruptcy Proceedings.—P. W. HORNE (Horne Bros.), electrical engineer, 260, Linthorpe Road, Middlesbrough.—Receiving order made January 13th, on debtor's own petition. First meeting, January 29th, at the Official Receiver's offices, 80, High Street, Stockton-on-Tees. Public examination, February 12th, at the Court House, Middlesbrough.

W. G. CONWAY (Lestron), wireless component dealer, 88-90, Chancery Lane, W.C.—Trustee, Mr. C. Latham, 78, New Oxford Street, W.C., appointed January 13th.

W. P. YOUNG, Leicester, mechanical and electrical engineer.—A supplemental dividend is being declared and proofs must be sent to Mr. Evan Barlow, Official Receiver, 1, Berridge Street, Leicester, by February 6th.

D. D. RAYNER & Co., Derby.—A meeting of the principal creditors was held at Derby on Tuesday last to discuss the future of the business.

J. RIGG and F. STEAD (Rigg & Stead), radio engineers, 17, Old Chapel Street, Blackburn.—Receiving order made January 16th, on debtors' own petition.

A. KERSHAW and C. H. WOOD (Kershaw & Wood), electrical engineers and merchants, 9, Bradford Road, Dewsbury.—Last day for proofs for dividend February 5th. Trustee, Mr. J. O. Morris, Official Receiver, 12, Duke Street, Bradford.

S. A. WARDELL, electrical engineer, 83, Raleigh Road, Richmond, Surrey.—Last day for proofs for dividend February 6th. Trustee, Mr. T. Gourlay, 29, Russell Square, W.C.1.

T. BARTON, electrical engineer, The Electric Works, Ainsworth Street, Blackburn.—First dividend of 15s. in the £, payable January 29th, at the offices of the Trustee, Mr. A. T. Eaves, 47, Mosley Street, Manchester.

JOHN BRODIE, lately carrying on business as an electrical engineer at Music Hall Lane, Dunfermline.—The adjourned examination of this debtor took place on January 21st, and was closed.

D. A. GRIFFITHS and R. L. H. HUGHES, trading as Griffiths and Hughes, 13b, Whitcombe Street, Aberdare, Glamorganshire, electrical engineers.—The public examination of these debtors was held on January 22nd, at Aberdare. The statement of affairs showed a deficiency of £441. Debtors commenced business in partnership and at first were successful, but two years later depression set in, and losses were also sustained on contracts. The examination was closed.

Company Liquidations.—EAGLE ELECTRICAL MANUFACTURING CO., LTD.—Winding up voluntarily. Liquidator, Mr. E. H. Henry, Ruskin Manor, Denmark Hill, S.E. Meeting of creditors held January 27th, at the George Hotel, Strand, W.C.

MARCONI SCIENTIFIC INSTRUMENT CO., LTD.—Winding up voluntarily. Liquidator, Mr. C. R. Dormer, 14, George Street, Mansion House, E.C. Meeting of creditors at 14, George Street, E.C.4, on February 3rd. Particulars of claims to the Liquidator by February 13th.

Dissolutions of Partnership.—CENTRAL RADIO DEPOT, vendors of radio apparatus, 4, Church Lane, Banbury.—Messrs. C. H. Ward, L. Ward, and A. J. Shelley have dissolved partnership. Messrs. C. H. and L. Ward will continue the business.

RADIO ELECTRICAL CO., electrical and wireless dealers, 12, South Queen Street, and 70, High Street, Morley, York.—Messrs. H. B. Philpott and A. Midgley have dissolved partnership.

American Power Scheme for Europe.—The European-American Utilities Co. of New York is projecting the establishment of large electrical works and the distribution of electrical energy over long distances and at cheap rates in the countries of Central Europe. The scheme includes Czecho-Slovakia, Poland, Rumania, Austria, and Hungary. It is understood that representatives of the company are already negotiating with a view to acquiring suitable plots of land. The company is also preparing plans for the electrification of railways and tramways in the countries mentioned.—*Financial Times.*

Book Notices.—The issue of the *Graphic* for January 16th is a special one containing a number of interesting articles and imposing advertisements relating to twenty-five years' progress in various departments of human activity. A large section devoted to the "Wonder of the Twentieth Century" has an introduction by Mr. Leo Scheff, who has acted as Special Commissioner in connection with this very creditable production. There are signed articles by Sir Hugo Hirst, the Hon. F. Vernon Willey (F.B.I.), Dr. J. A. Fleming, the late Captain H. Riall Sankey, Prof. G. W. O. Howe, Mr. V. W. Dale (E.D.A.), and Sir Alex. Roger (Telephone Development Association), on subjects in which they are specially interested, and a great deal of space is devoted to interesting publicity matter regarding the works and operations and manufactures of the G.E.C., Ltd., Standard Telephone & Cables, Ltd., the Chloride Electrical Storage Co., Ltd., Doulton & Co., Ltd., Burndept Wireless, Ltd., the Marconiphone Co., Ltd. (Sterling), and other companies.

"*The Wireless Trader* Year Book and Diary." London: Trader Publishing Co., Ltd. Price 5s. 6d.—We have found the first (1925) edition of this work useful during the past year and are accordingly glad to note that the 1926 edition has been revised and brought up-to-date; in addition to a "one week at view" interleaved diary, the principal contents include alphabetical lists of trade and professional addresses, proprietary names of sets and components, a comprehensive guide to goods supplied and services rendered, a list of factors (arranged territorially), data on technical and broadcasting matters, and other trade information. An effort has been made to include only *bona-fide* factors and manufacturers connected with the retail trade, and a time-saving feature is the addition of their telephone numbers.

"The *Practical Engineer* Electrical Pocket Book and Diary, 1926." Edited by Conrad Arnold, A.M.I.E.E. Pp. cxx +736; illustrated. Oxford University Press. London: Humphrey Milford.—The sections of this 27th edition of the work have been revised and brought up to date, and in many cases re-written. The section on Switchgear and Circuits has been so dealt with by Mr. H. Trencham, A.M.I.E.E., who has carefully set basic principles so as to guide the engineer in meeting the varying requirements of his work.

"Broadcast Reception in Theory and Practice," by J. L. Pritchard. Pp. xi + 259; figs. 160. London: Chapman and Hall, Ltd. Price 8s. 6d. net.

"The Radio Year Book, 1926" (fourth year). London: Sir Isaac Pitman & Sons, Ltd. Price, 1s. 6d. net.—This work deals with the most important developments in broadcasting in 1925; most listeners will find items of interest amongst the many reproduced photographs of "notabilities before the microphone," whilst the section on the "Children's Corner" contains hitherto unpublished information. Various articles in the technical section can be read with profit, and useful data and a trade directory portion are included.

We have received from the Clyde Valley Electrical Power Co. a copy of the first issue of the "C. V. Magazine." We find this to be a well-balanced journal in which technical matters, social events, and other notes and news all receive a fair share of attention. There are numerous illustrations, and one drawing takes the form of an unsolicited testimonial to the ELECTRICAL REVIEW.

"The Technology Reports of the Tôhoku Imperial University, Sendai, Japan." Vol. V, No. 4, 1925. Tokyo and Sendai: Maruzen Company, Ltd.

"The Mining Electrical Engineer. Vol. VI, No. 64. January, 1926. The Association of Mining Electrical Engineers. Price 1s.

"Elements of Electricity," by W. H. Timbie. Second Edition. Pp. xi + 624; figs. 428. Price, 17s. 6d. net. "House Wiring," by G. A. Willoughby. Pp. xi + 219; figs. 209. Price, 10s. net. London: Chapman & Hall, Ltd.

Increased Prices.—Owing to the increased cost of rubber, Messrs. Fuller's United Electric Works, Ltd., Chadwell Heath, Essex, have increased the price of v.i.r. lead-covered cable by 17½ per cent., and of v.i.r. braided cable by 15 per cent., from January 22nd.

A West Ham Poster.—A large poster, measuring about 4 ft. by 3 ft., has been issued by the West Ham Corporation Electricity Department (engineer, Mr. F. W. Purse). It is headed with the county borough arms, and asks "Why be old-fashioned and out of date?" It compares, by means of pictures, ancient and modern methods of travelling and cooking, and concludes with the words, "Why not use electricity and be right up-to-date?"

Newcastle Contractors' Dinner.—The annual dinner of the Newcastle Branch of the Electrical Contractors' Association (Inc.), was held at the Crown Hotel, Newcastle, on January 21st. In the absence, through ill-health, of the chairman, Mr. T. Atkinson, the vice-chairman, Mr. Lowrey, presided, and Mr. T. E. Alger, the president of the Association, and the Deputy Lord Mayor, Councillor W. V. Longfield, were present. In responding to the toast of "The Lord Mayor and Corporation," proposed by Mr. A. Andrews, the Deputy Lord Mayor mentioned a number of important developments which were in progress in the city. Mr. W. Horsfall proposed the toast of "The Electrical Contractors' Association," mentioning the lead which Newcastle had taken in electrical development, and Mr. T. E. Alger replied. The Deputy Lord Mayor proposed the toast of "The Institution of Electrical Engineers," which was responded to by Mr. W. Cross. A musical programme followed the dinner.

Private Hydro-Electric Development in New Zealand.—The Wellington correspondent of *The Times* reports that the New Zealand Government has granted licences to a private syndicate to develop water power in Smith Sound and Lake Manapouri, and on the Southern Fiord in Lake Te Anau. These are the first licences issued for any great private hydro-electric development scheme, the previous work having been undertaken by public bodies. The intention is to produce, ultimately 300,000 h.p. for the manufacture of nitrate fertilisers. The licences are for a period of 60 years with a Government right of purchase after 30 years.

An E.T.B.I. Ballot.—The annual ball of the North-East Coast Section of the Electrical Trades Benevolent Institution took place on January 22nd at Newcastle, and in connection with it an electrical ballot was organised. The purchasers of tickets were asked to place a number of electrical appliances in order of popularity, and eleven prizes were presented by electrical firms in the district. The net proceeds amounted to £115. In the list of prize-winners, which has been sent us by Mr. R. E. Robson, we notice the following names:—Third, Mr. W. Findlay (Edinburgh); seventh, Mr. R. W. Gregory (Newcastle); and ninth, Mr. W. E. Bush (E.L.M.A.). The secondary object of the ballot was to further the "electrical idea," and it was found that the most popular appliance was the electric iron; this was followed, in the order named, by the sweeper, kettle, oven, radiator, washer, grill, toaster and fan (level), sewing machine, milk warmer and coffee percolator (level), shaving pot, and hair drier.

A Belling Sports Club.—The staff and employés of Messrs. Belling & Co., Enfield, have formed a social and sports club.

Local Exhibition. — BURNLEY.'— An electrical exhibition organised by the Corporation Electricity Department was opened at the Pavilion Picture Palace yesterday; it will remain open until February 6th. Eighteen stands have been arranged, and many leading electrical firms are represented. The Department has a varied collection of appliances, and the stand is shared with the Burnley Components, Ltd., Santon, Ltd., and Whittaker Bros. Other exhibitors are:—Standard Telephones and Cables, Ltd.; Siemens and English Electric Lamp Co., Ltd.; Thorwash, Ltd.; the Electric Lamp Manufacturers' Association; the Jackson Electric Stove Co., Ltd.; the Metropolitan-Vickers Electrical Co., Ltd.; Carron Company; the Hotpoint Electric Appliance Co., Ltd.; the General Electric Co., Ltd.; Credenda Conduits, Ltd.; the British Electric Transformer Co., Ltd.; the Cable Accessories Co., Ltd.; the English Electric Co., Ltd.; Messrs. Bastian & Allen; the Singer Sewing Machine Co., Ltd.; and the British Thomson-Houston Co., Ltd. The catalogue produced in connection with the exhibition sets out very clearly the favourable terms for the supply of electricity and the hire or hire-purchase of appliances which the Department has instituted.

Swiss Industries Fair.—It is announced that the tenth Swiss Industries Fair will be held at Basle from April 7th to 17th.

Electricity at the Ideal Home Exhibition.—An Electric House, which is being organised by the British Electrical Development Association, will prove one of the chief attractions of the forthcoming Ideal Home Exhibition at Olympia. The structure will contain an old-fashioned kitchen, a modern kitchen, an old-fashioned living room, a modern living room, and, in addition, an up-to-date bedroom and laundry. Visitors will thus be able to appreciate by contrast the comfort and convenience obtainable to-day by electrical means, but utterly unthought of a few generations ago. In each apartment will be found a complete range of modern British electrical appliances in actual operation, and the fullest information will be available concerning their cost, manner of use, and the cost of the necessary energy. The lighting of the house will form a very special and interesting feature. Electric heating will be represented by examples of the most modern types of radiant fires. Continuous demonstrations of electric cookery will take place in the modern kitchen daily. Many semi-portable and table appliances will also be exhibited. In the bedroom the conveniences of a well-wired house will be displayed in the facilities for warming without waste or work, for dressing, making morning tea and other adaptations of electricity. Water heating will be a feature of the bathroom. Electric ironing, washing, mechanical washing of plates and dishes, silver cleaning, and other tasks will be seen in the laundry. An inquiry bureau will enable visitors to obtain information concerning the supply facilities in the districts in which they reside. Literature will be provided and everything possible done to make a visit to the electric house as educational and practical as possible.

The Business Controller.—We have received from the American Management Association a copy of a paper dealing with the functions of the controller in American businesses. While these functions necessarily vary in different spheres, it appears from the paper that generally it is the duty of the controller, among other things, to devise, install and maintain the accounting system; to supervise the receipt and disbursement of moneys; to look after the pay roll; to control stocks and supplies, and take inventories; to maintain a check upon the treasurer's receipts, disbursements and bank balances; to prepare detailed statements of accounts and analyse and summarise these; and to supervise the operation of the company's "budget."

For Sale.—Mr. Fred. Lake, of Devonshire Street, Theobald's Road, London, W.C.1, has 500 miles of British-made electric cables for sale. Cheadle and Gatley U.D.C. Electricity Department invites offers for a number of maximum demand indicators. East Ham Corporation Electric Lighting and Tramways Department has for disposal one 350-i.h.p. horizontal cross-compound engine direct coupled to a 225-kW Dick-Kerr generator. Messrs. H. Butcher & Co. will sell by auction on February 9th, at the late Whitehead Aircraft Co.'s works, Feltham, power plant, including generating sets, panels, switchgear, motors, &c. (See our advertisement pages to-day.)

Appliance Sales by Electricity Suppliers.—*Electrical Merchandising* states that during 1924 electrical appliances to the value of $47,601,000 were sold by 2,644 companies in the United States whose principal business is the supply of electricity. As the total sales of appliances in their territory reached $111,892,000 during the year in question, the companies' share was no less than 41 per cent. The remainder was supplied as to 26.9 per cent. by electrical dealers, 15.4 per cent. by department stores, and 15.2 per cent. by "other stores." Another interesting fact brought out in the article to which we refer is that the number of residential consumers in the areas dealt with was 8,274,900, giving a *per capita* expenditure of $12.82 upon electrical appliances.

New Spanish Company.—La Sociedad de Fuerzas Motrices de Covadonga is the name of a new hydro-electric company recently organised in Barcelona with a capital of 525,000 pesetas.

Encouraging Registered Contractors.—Mr. J. H. Parker, the borough electrical engineer of West Hartlepool, has decided that in future only registered electrical contractors will be given Corporation contracts.

The Norwegian Electrochemical Industry.—Dealing at length with the present and future prospects of the electrochemical industry in Norway, Mr. Ove Collett, although not acting as an engineer in this industry at the moment, has responded to a request made by *Norges Handels og Sjofartstidende* for information on the subject. At the outset he points out that the total of the water powers now in use represents 1,400,000 electrical horse power, of which about one-half, or 750,000 h.p., is arranged for the use of the electro-chemical industry, whose works and corresponding plants have a value of from 400 to 500 million gold kroner, and whose net export of products (value of exports less the value of the imported raw materials) is estimated at 126 millions of gold kroner when working at full output. The actual net value of the exports in recent years, however, has been appreciably lower than the last figure as the production in the case of many works is far below the capacity and some works have discontinued their activity. As to the future of the Norwegian electrochemical industry, Mr. Collett reaches the conclusion that the nitrogenous branch will remain the principal part of the industry. The only other branch of the various sections of the industry, based upon the methods at present employed, that can be thought capable of developing so as to consume a really large part of the unutilised water powers, seems to be the aluminium branch, and possibly also zinc production. If employment is to be found for large powers outside these branches, he considers that other methods of manufacturing than those now now in use in Norway will have to be provided, and it is probable that these will be found.

Lighting and Power Notes.

Ashburton.—SCHEME REJECTED.—The Urban District Council has been informed that the Electricity Commissioners have rejected an application by Mr. Hartree for powers to supply electricity to the town.

Australia.—TASMANIA.—We have received from Mr. H. A. Curtis, chief engineer and general manager of the Tasmanian Government Hydro-Electric Department, a copy of his report for the year ended June 30th last, together with branch reports. The operation branch earned a revenue of £164,141, the major part of which was derived from the sale of electricity in bulk. The working expenses amounted to £17,652, and the gross profit was thus £146,489. The revenue from the Hobart branch amounted to £103,995. Working expenses were £15,148, and the purchase of bulk supplies amounted to £46,552, leaving a gross profit of £42,294. The Derwent Valley service showed a revenue of £3,795, and working expenditure of £2,379, leaving a gross profit of £1,415, which was transferred to a main joint account, together with the gross profits from the Operation and Hobart branches, and interest, making a total of £190,373 available. Interest and other charges absorbed £210,546, and the net debit balance for the year amounted to £20,170. The output of the Waddamana power station increased by 8,258,800 kWh to 284,125,900 kWh. With regard to the Shannon scheme, a contract for the civil work has been placed with Armstrong, Whitworth Pty., Ltd., and good progress with the scheme is anticipated during the coming summer. In the Hobart district a further portion of the 6,600-V supply area has been changed over to 11,000-V, and new feeders have been laid and now extend to Taroona. Additions have been made to the sub-station at Electrona, and a supply made available to the Channel towns as far as Port Cygnet, and to Kingston and Brown's River.

Bedford.—ELECTRICITY SUPPLY.—The Rural District Council has given consent to an application by the Town Council for the use of overhead wires for the supply of electricity to the parishes of Cardington, Cople, and Potton.

Bingley.—PURCHASE OF DOMESTIC APPARATUS.—The Lighting and Tramways Committee is applying for sanction to the borrowing of £5,000 for the purchase of domestic electrical apparatus to be let out on hire.

Bradford.—STREET LIGHTING.—The special joint sub-committee of the Corporation appointed some time ago to make experiments in both electric and gas street lighting with a view to general improvement, has failed to come to any decision, and has reaffirmed a former decision to call in outside expert advice. The former decision was to call in the lighting superintendent of the Glasgow Corporation, but the Finance Committee of the City Council rejected the proposal.

Brierfield.—PROPOSED CHANGE-OVER.—The Urban District Council has decided to apply to the Electricity Commissioners for sanction to borrow £9,000 for converting the present system of electricity supply from d.c. to a.c.

Canada.—HYDRO-ELECTRIC DEVELOPMENT.—According to the *Electrical News*, the ninth unit in the Queenston power house has been in operation for a short time now. This brings the output from the Queenston-Chippawa development up to something in excess of half a million horse power, which is the maximum possible under the present limitations regarding the diversion of water from the falls.

Cheltenham and Gloucester.—ELECTRICITY SUPPLY.—The question of bulk purchase of electricity by the Corporations of Gloucester and Cheltenham has been referred to the Electricity Commissioners. Formal objection has been lodged by those two authorities to the application of the Bristol Corporation to establish a generating station at Portishead in view of its possible effect upon the proposals to develop the undertakings at Gloucester and Cheltenham.

Continental.—GERMANY.—According to the Frankfurt correspondent of *The Times*, plans for carrying out the largest hydro-electric scheme in Europe, that of the Ourtal dam on the frontier between Luxemburg and Germany, have now been approved. The essential feature of the scheme consists in erecting a large dam, 348 ft. high, which will impound the water of the rivers Our and Irsen and create a lake about 13 miles long and about a mile wide, extending between Stolzembourg and Ouren. By erecting another dam above Vianden a small additional lake will be formed and a powerful pumping station will carry back the water to the larger lake. The carrying out of this scheme will necessitate a capital expenditure of 500,000,000 fr., and this money will be provided by the district of Bitburg, the A.E.G., and the German Reich.

ITALY.—The Società Elettrica Bergamasca is erecting a 50,000-V transmission line between the transformer station at Dalmine of the Società Generale Elettrica Adamelli and its sub-station at Santa Lucia (Bergamo).

An important hydro-electric scheme in the Upper Borbera valley, in the Ligurian Appenines, is at present under consideration. It involves the construction of an artificial lake nearly 4½ miles long by one mile in width. It is estimated that the lake could supply about 1,320 gallons per sec., which would be utilised by two 20,000-h.p. hydro-electric power stations to be erected at Cellio and Cavi.

FRANCE.—La Société Savoisienne de Constructions Electriques, of Aix-les-Bains, has recently completed an outdoor 60,000/15,000-V transformer station at Romainville for the Société de l'Union d'Electricité de Paris. The plant has a capacity of 18,000 kVA.

Dearne Valley.—ELECTRICAL DEVELOPMENT.—The Dearne District Electricity Board is offering to wire small houses for domestic purposes on the instalment system at an average weekly cost for five years of 1s. 6d.

Hamilton.—ELECTRICITY SUPPLY.—It was reported at a recent meeting of the Town Council in connection with the hydro-electric installation, that offers would be received at an early date from firms willing to submit schemes for the necessary plant. With reference to the extensions at the electricity works, Mr. Gavin Paterson, architect, is to prepare a plan and estimates.

Irish Free State.—DUBLIN.—At a recent meeting of the City Administrative Commissioners, the following modified charges for electricity were recommended:—As an alternative to the ordinary rates of charges, residential or domestic consumers will be given the option of paying a fixed annual charge, based on 15 per cent. of the valuation of the house, plus 1½d. per kWh for electricity for all purposes, which includes meter rents. The rate for electricity through slot meters to be 9d. per kWh, to include rent of meter. The present rate of 2d. per kWh for power to be reduced to 1½d. A flat rate of 3d. per kWh for advertising purposes after 6 p.m. Cookers to be supplied and fitted by the Corporation, subject to a quarterly charge varying from 15s. to 10s., according to the size of cooker. The recommendation was adopted.

THE RIVER LIFFEY TUNNEL.—The Dublin City Administrative Commissioners have decided to invite tenders for the construction of a tunnel under the River Liffey connecting the North and South quays. The cost will be between £45,000 and £60,000, and provision will be made for carrying the city electric cables through the tunnel.

ELECTRICITY SUPPLY (SPECIAL POWERS) BILL.—At the recent sitting of Dail Eireann, the Electricity Supply (Special Powers) Bill was passed, an amendment thereof by the Senate having been accepted by the House.

Japan.—ELECTRICAL DEVELOPMENT.—The Railway Minister, Mr. Wengoku, is reported to have decided to construct a steam power station at a cost of about 20,000,000 yen, in the place of the present Yaguchi power station, which will be abolished upon completion of the former station. The scheme will ensure a supply of electricity for the Government electrified railways. The site for the new station will probably be at Rokugo or Tsurumi, and plant with a capacity of 60,000 kW will be installed.

It is understood that the scheme to establish the Tenryugawa Electric Power Co. is making good progress. There will be nine hydro-electric power stations to be built along the Renryu River. The work will be divided into three parts, the first of which will consist of the first and third power stations of 21,000 kW, and the second will be the sixth power station of 38,800 kW, the remaining stations being included in the third period. The total output will amount to 210,000 kW, and the total cost is estimated at 87,400,000 yen.

Keighley.—PROPOSED EXTENSION OF SUPPLY.—A proposal is to come before the next Council meeting that application be made for power to include the townships of Keldwick, Cowling Cross Hills, and Glusburn in the Council's area of electricity supply.

London.—ST. MARYLEBONE.—The Electric Supply Committee has recommended the following reductions in the charges for electricity:—Lighting: Flat rate, from 4½d. to 4d. per kWh; slot meters from 5d. to 4½d. per kWh. Annual contract demand (telephone) and long term rate: The "unit" charge from 1d., ¾d. and ⅝d. to ⅞d., ⅝d., and 9/16d. per kWh. The Committee has also recommended that ten-year agreements be entered into with H.M. Office of Works and the Crown Estate Paving Commissioners for the lighting of 283 lamps in Regent's Park within the borough for the sum of £4 4s. per annum for single burner lanterns and £6 6s. per annum for double burner lanterns, and that the Council approve the expenditure of £3,300 for carrying out the work of converting the lamps from gas to electricity.

STEPNEY. — The Finance Committee has recommended that application be made for sanction to the following loans:—£148,410 for h.p. feeders to the new St. George's sub-station from Limehouse, l.p. feeders from the sub-station to various feeding points, additional h.p. and l.p. feeders in connection with the Mile End sub-station, a h.p. feeder terminating at the Bethnal Green boundary, and a l.p. feeder from the Whitechapel sub-station; £81,550 for mains and disconnecting boxes. A further sum is also allocated for house services. Of this total expenditure of £274,960, £32,210 has already been sanctioned by the Electricity Commissioners.

New Zealand.—HAWKES BAY.—The Hawkes Bay Power Board recently conducted a poll of the ratepayers with regard to the borrowing of £300,000 by the Board, for the purpose of reticulating Hawke's Bay County and the Taradale town district for Mangahao power. The ratepayers have voted in favour of the scheme.

Northern Ireland.—ARMAGH.—The Urban Council has decided to seal an agreement with Mr. P. A. Spalding, electrical engineer, of Dundalk, for the lighting of the town by electricity.

LURGAN (ARMAGH).—At a meeting of the Urban District Council on January 18th, it was decided to proceed with the electricity scheme which was commenced in 1914, but had to be postponed. The engineer stated that the completion of the scheme would cost £15,000.

Preston.—LOAN.—The Electricity Committee has recommended to the Corporation that application be made for sanction to the borrowing of £20,000, being the estimated cost of changing over to 3-phase supply in Avenham and Deepdale districts, and laying new feeder mains.

STREET LIGHTING.—The Streets Committee has recommended a scheme of electric street lighting on the new arterial road at a cost of £1,080. The annual running cost of 36 lamps will be £360.

Rawtenstall.—NEW PLANT.—The Corporation has received formal consent to its application to increase the plant at the electricity works to reach 6,000 kW.

LOAN.—The Corporation is applying for sanction to a loan of £20,000 for mains.

South Shields.—WIRING OF SMALL HOUSES.—At a recent meeting of the Electricity Committee, the engineer reported that up to date over 10,000 applications had been received under the assisted wiring scheme, the number of consumers actually connected to date being over 3,750; the total revenue collected amounts to £1,009, whilst the total amount of energy sold amounts to 36,570 kWh.

South Africa.—ELECTRICAL DEVELOPMENT.—According to the *South African Engineer*, on November 12th, a new 3,000-kW turbo-alternator was officially started up at the Port Elizabeth electricity works. This set brings the capacity of the station up to 9,500 kW, and the present annual output varies between seven and eight million kWh.

Rapid progress is now being made with the Witbank electricity undertaking. The station will contain three 20,000-kW sets, with accommodation for the introduction of another two sets, equal to a total capacity of 100,000 kW. The current from the station will be sent out at a pressure of 132,000 V along 65 miles of overhead transmission lines to the Brakpan station of the Rand system. It is hoped to have one of the sets in operation in a few months' time.

Spalding.—Electricity Supply.—According to *The Times*, at a special meeting of the Urban District Council on January 22nd, it was reported that the Electricity Commissioners were still strongly opposed to the erection of a generating station for Spalding, their attitude being consistent with the electricity scheme of the Government. The Commissioners were prepared to sanction an underground main from the Peterborough Corporation works to Spalding, at a capital cost of approximately £20,000, and to extend the loan period. They would also support an application from the Spalding Council to include the districts of Crowland, Holbeach, Sutton Bridge, and Bourne in its area supply. The Council appointed a sub-committee to consider the matter.

Special Orders.—The Electricity Commissioners have submitted to the Minister of Transport for confirmation a Special Order made by them authorising the Sussex Electric Supply Co., Ltd., to supply electricity in the urban district of Littlehampton.

Applications have been made for Special Orders by the following authorities:—The Midland Electric Corporation for Power Distribution, Ltd., for the supply of electricity in certain parishes within the rural district of Seisden; the Oxford Electric Co., Ltd., to extend its area of supply so as to include the urban district of Wheatley, and certain parts of the rural districts of Culham and Headington.

United States.—Electrical Development.—According to *Power*, the new steam power station near Cincinnati of the Columbia Power Co., was formally inaugurated on December 10th. The initial capacity of the station is 90,000 kW, furnished by two 45,000-kW tandem-compound turbo-generators.

Weymouth.—Loan.—The Electricity Committee is applying for sanction to the borrowing of £3,000 for services and £3,000 for mains.

Worcester. — Electrical Development.—Extensions are being made to the electricity undertaking at a cost of £58,724. The extensions include the installation of a 6,000-kW turbo-alternator with all accessories at a cost of £23,758, and a continuous flow condenser at a cost of £6,200. The matter of establishing a reciprocal service between the Worcester undertaking and that of the Shropshire, Staffordshire and Worcestershire Power Co., Ltd., at Stourport has been in hand for some time, and consideration is also being given to the question of purchasing a supply in bulk from the Stourport undertaking.

Worksop.—Price Reductions.—The Urban District Council has decided to make the following reductions in the charges for electricity on and after April 1st next:—Lighting: A reduction of 1d. per kWh. Heating: A reduction of ½d. per kWh. Power: Business tariff reduced to 1d. per kWh, all the year round, and the maximum demand charge from £10 to £8 per kW; baths tariff reduced by ½d. per kWh. Domestic tariff: Fixed rateable value charge reduced from 20 to 10 per cent. Public lighting: A reduction of 5 per cent.

Tramway and Railway Notes.

Australia.—Brisbane.—According to the *Electrical Engineer of Australia and New Zealand*, the Brisbane tramway, which has been under the administration of the Tramway Trust for the past three years, has been handed over to the Greater Brisbane Council. The administration of the undertaking will still be carried on by the existing staff, but matters of policy will be decided by the transit committee of the Council in place of the Tramway Trust.

Geelong (Vic.).—Authority has been given for the Melbourne Electric Supply Co. to construct a new electric tramway in Geelong, running from the city through Geelong West to the suburb of Corio. Application is being made for authority to lay another route from the present Moorabool Street terminus across the Barwon bridge and along the Colac Road through Belmont.

Continental.—Spain.—The Compañia Metropolitano Alfonso XIII, which operates the underground electric railway in Madrid, has recently secured a concession for a new line in the city between Cuatro Caminos and El Estrecho.

Corsica.—The Société Générale d'Entreprises, of Paris, has drawn up a scheme for the electrification of the Sarteni district of Corsica. The plan includes the establishment of a railless-car service for the transport of both goods and passengers in the district which is at present not provided with any railways.

France.—A scheme is under consideration for the establishment of a railless-car service in the Lorient district of Brittany for the transport of both passengers and goods. The plan includes the use of special trailers on which railway trucks carrying material from the kaolin quarries at Lann-Vrian and Kergantie would be transported to the Orleans railway, so avoiding the necessity of transhipping the kaolin.

Italy.—The Italian Government has recently granted subsidies in connection with the electrification of the tramways between Brescia and Ponte Aglio, and between Padua, Santa Soffa and Bagnoli.

Gloucester.—Abandonment of Route.—The Light Railways and Electricity Committee has recommended to the Corporation that the tramway service between Barton Street and Tuffley, and from Stroud Road Junction and St. Paul's Church be discontinued, and that some other form of transport, to be considered at some future date, be substituted.

Japan.—Tokyo.—It is understood that a plan has at last been adopted for the construction of an underground railway in Tokyo. The total cost amounts to 187,000,000 yen, to be defrayed in 13 consecutive years, beginning with the fiscal year 1926-1927. The total length of the railway will be 41 miles, of which one mile will be built in the fiscal year 1926-1927, three miles in 1927-1928, and 3½ miles in each of the subsequent years. The cost includes 6,306,600 yen for track, 7,360,000 yen for stations, 20,160,000 yen for rolling stock, 1,690,000 for machinery, 6,957,700 yen for transmission lines, and 2,727,400 yen for two sub-stations.

London.—Tube Fire.—Traffic on the Hampstead tube between Golder's Green and Camden Town stations was delayed on the morning of January 19th. An official statement issued by the Underground Railways reports that, due to the short-circuiting of some cables immediately adjacent to a storeroom, a small fire occurred which affected the signals between Camden Town and Golder's Green, causing a partial stoppage to the train service during one and a half hours. The station staff dealt with the outbreak immediately, but work on the repair of the signal cables occupied some time before the service could be restored to normal.

Perth.—Tramway Position.—The *Electric Tramway and Railway World* states that the Town Council has resolved to consider in committee the whole question of the present condition of the Corporation's tramway track. The decision follows on a report by officials received by a joint meeting of the Tramways and Finance Committees, from which it appeared that the estimated cost of the work required to put the permanent way in a condition to last another ten years was £30,350; and that two cars and two more omnibuses proposed to be purchased would cost £3,000 and £2,800, respectively.

United States.—Railway Electrification.—Plans are being prepared for the extension of the electrification of the Virginian railway to Roanoke, a distance of 134 miles, at an estimated cost of $15,000,000.

Telegraph and Telephone Notes.

Canada.—Wireless Direction Finding.—The first test of wireless direction finding on the Great Lakes has been completed. The necessary equipment was installed by the Canadian Marconi Co. on the steamer *Gleneagles*, and the results are reported to have been most satisfactory. During the coming navigation season the system will be operated in conjunction with lake-shore stations erected for the purpose.—*Reuter's Trade Service* (Port Arthur, Ontario).

Continental Telephony.—New Lines.—Three new telephone lines have just been put into service between Paris and Geneva, which addition is expected greatly to improve communications between the two centres.

According to the *Daily Mail*, the completion of the line from Mülheim-Ruhr by Wesel, Emmerich, and Bapperich to the Dutch frontier brings the day nearer when telephone conversation between England and Germany will be possible. The line is connected in Holland with England and in Mülheim with Berlin, and will later be connected to towns still further apart.

France.—Rate Increase.—Proposals for an all-round increase in French inland letter, telephone, and telegraph rates are before the Finance Committee of the Chamber. The scheme is estimated to bring in an additional revenue of 315 million francs, and provides for a change in the method of charging for inland telegrams. It is suggested that they should in future be divided into two categories; those destined for the same department or neighbouring departments, and those for more distant departments. The first category would be charged for at the rate of 20 centimes a word, with a minimum of ten words, and a surtax of 50 centimes on each telegram; the charge in the second category would be 25 centimes per word. Local telephone calls from public boxes would be increased from 25 centimes to 50 centimes, and from private telephones from 15 centimes to 25 centimes; semi-local calls would cost 1 franc and 50 centimes, respectively, and for calls within the same department not classed as either of the above, a uniform rate of 2 francs.—*Reuter* (Paris).

Telephone Development Association.—Annual Meeting.—The annual general meeting of the above-named Association took place at Magnet House, London, on January 20th. Sir Alexander Rogers, chairman, pointed out that the report covered the period from the date of incorporation on December 5th, 1924, to October 31st, 1925. The number of subscribers had increased, and the Association had derived assistance from many branches of the telephone industry. Instead of 1,388,000 telephones, their aim was to secure an additional 3,000 000 within seven years. Development on that basis would involve a capital outlay of £150,000,000, which expenditure should be remunerative and self-supporting. The Association experienced no opposition in its work, but plenty of passive indifference; it had had a busy year, and its propaganda and advertising were doing good, and out of 371 inquiries in the London area only 18 (4.8 per cent.) decided

against becoming subscribers; 190 applied for service, and the remaining 163 were cases still in hand. Results in Newcastle, Manchester, Blackburn, Reading, Glasgow, Canterbury, and so on, were better than in London, the conclusion being that the public was not informed previously of the facts concerning the actual cost of telephone facilities offered. Information and experience that is being accumulated is being placed at the disposal of the Post Office.

The Telephone Service.—PUBLIC CALL BOXES.—The Telephone Department of the G.P.O., recognising that there is a need for more public telephones, has decided to install in the London area 108 more telephones, including those in 67 street kiosks, 21 call boxes at the railway stations, and 20 ordinary boxes at convenient centres. This number will be increased as soon as negotiations with the authorities concerned, such as the borough councils and the railway companies, can be completed. In London there are only 4,472 public telephone call boxes, with 3,000 private call offices. There are 932 call boxes at the different railway stations, and 226 street telephone kiosks.

TEN PER CENT. INCREASE.—Figures for the past year show an increase of barely 8½ per cent. in the number of telephones in use in this country. The total has risen to about 1,357,500, an increase during the year of 113,900, while in London, which is responsible for about one-third of the whole, the number has risen from 439,223 to 476,500, an increase of about 37,000. In the view of the Telephone Development Association these figures hardly show the progress that might have been expected. The Association points out that the figures for the State of New York, for example, for the first nine months of last year show a more rapid expansion, despite the fact that New York State already possessed more telephones than the whole of Great Britain. On January 1st, 1925, there were in N.Y. State 1,883,795 telephones, and on September 30th 1,996,902, or a net increase in the nine months of 113,107. New York City itself added in the first nine months 74,604 instruments, a rate of increase nearly three times as great as London's.

Radio Notes.

Australia.—LICENCES CANCELLED.—Although during October, 1925, the number of people holding listening licences increased, no fewer than 3,513 licences were cancelled during that month. The State where broadcasting was first developed, New South Wales, was responsible for almost the entire number of cancellations. During the month, 1,672 new licences were issued, but 3,361 were cancelled. In New South Wales, 37,203 licences were in force in November, 1925, compared with 28,442 in Victoria. In making these figures available, the Director of Postal Services (Mr. H. P. Brown) said that the Department had got in touch with a large number of persons who had not renewed their licences with the object of finding out if any common motive had inspired them, says the *Sydney Morning Herald*. Only a small proportion said that the programmes did not appeal. The others had all sorts of private reasons in which the expense of renewals figured largely. Mr. Brown added that steps were being taken to introduce more effective policing to discover unlicensed listeners.

China.—BROADCASTING.—Interest in radio broadcasting is increasing in China, says the *Daily Mail* special correspondent, who explains that news is broadcast from a shop in Shanghai and music from a local dance hall. He says: "Many of the wealthier Chinese own expensive high-powered receivers. Receiving sets are forbidden in China by a quaint law which classifies them as munitions of war. However, officials ostentatiously ignore its infraction. There are thousands of sets in Shanghai, how many no one can even estimate. The majority are of local construction from 'knockdown' kits imported from America. They range from the humble cat's whisker type to ten-valve super-heterodynes that howl miserably in the night. The lesser sets must depend upon the Shanghai shop aforementioned and the voluntary ministrations of amateur transmitting stations, of which there are many. The majority of the latter are European-owned. I have not seen a single British-made set anywhere, but American receivers are almost universal, and representatives of the big American radio companies are waiting in Shanghai for permission to import material in bulk."

Holland.—NEW PLANT.—Subject to the necessary consent of the Government, a second transmitting installation is to be erected at the broadcasting station at Hilversum, says the *Daily Mail*, which will allow of regular weekly programmes in addition to those broadcast by the religious and educational societies.

WIRE RELAYS.—The Hague telephone administration has succeeded, says *The Times*, in working out the plans for a system by which it will be possible to distribute wireless programmes to telephone subscribers. The wireless connection will be automatically cut out when an ordinary telephone call is put in and come into operation again when the call is finished. One large antennae and a receiver will have to be installed in the Central Telephone Office. Connection will be obtained through apparatus which will be supplied to telephone subscribers for ten florins (18s. 6d.). Additional earpieces can be supplied at 14s. 6d. each, and the annual charge for the service will be 30s. The manager of the telephone service will be responsible for selecting the programmes, which might be from any station. There is a possibility that, by means of the new service, operas or concerts might be transmitted directly to local subscribers. The entire cost of installing the new apparatus in the Central Telephone Office will not exceed £200. The municipality will shortly decide whether the scheme is to come into operation.

Licences.—DEMAND MAINTAINED.—It is understood that during December, 1925, the number of licences purchased by broadcast listeners amounted to 69,593. The average monthly purchase is between 40,000 and 50,000, the total number issued at the end of the year being 1,644,325.

Station Mishaps.—STAND-BY PLANT USED.—The London station of the British Broadcasting Co., Ltd. (2 LO in Oxford Street), has experienced bad luck during the last few weeks. Of the several interruptions of the programme which have occurred lately, the breakdown on January 21st was the most lengthy; no transmission took place between 1 and 2 p.m., and it was not till 4.10 p.m. that broadcasting was resumed by means of the plant employed when transmission took place from Marconi House. The old aerial in the Strand was only employed for about an hour and a half, but the permission of the Postmaster-General and the Air Ministry had to be obtained before it could be made use of, in order that as little interference as possible should be caused to the Air Force wireless service.

Contracts Open and Closed.

(The date given in parentheses at the end of the paragraph indicates the issue of the "Electrical Review" in which the "Official Notice" appeared in our advertisement pages.)

Open.

Australia.—MELBOURNE.—Postmaster-General's Department, March 23rd. Telephone switches and magneto trunk switchboards.

March 29th. State Electricity Commission. Transformers and auxiliary apparatus.*

March 8th. City Council. Totally-enclosed armoured type switchgear. Specifications from the City Electrical Engineer's Office, Melbourne.

April 27th. 2,000-kW rotary converter, switchgear with accessories, and a.c. control gear. Specifications from City Electrical Engineer's Office.

SYDNEY.—February 10th. New South Wales Government Railways. 100 40-h.p. traction motors; March 3rd, 101 electric car equipments, consisting of motors, control equipments, air compressors, pantographs, &c.; April 14th, one 5-ton fixed electric crane. Forms of tender from Chief Mechanical Engineer, Wilson Street, Redfern, Sydney.

February 17th. 1,500-V, d.c. switchgear for St. Leonards and Hornsby sub-stations; March 3rd, 11,000-V ironclad switchgear for St. Leonards sub-station; March 10th, stokers or pulverised fuel equipment for three water-tube boilers for White Bay power house. Specifications from Chief Electrical Engineer, 61, Hunter Street, Sydney.

Municipal Council. February 15th. Twenty transformer tanks. February 8th. L.p. cables. Specifications from the Construction Engineer, Electricity Department, Town Hall, Sydney.

March 2nd. Australian Gas Light Co. One 750-kW turbo-generating set. Specifications from the Engineer, Parker Street, Haymarket, Sydney.

Aylesbury.—February 16th. Electricity Department. Overhead 11,000-V transmission lines and cables. (January 22nd.)

Bath. — January 29th. Electricity Department. One 6,000-kW turbo-alternator, one water-tube boiler, mechanical stoker and economiser, and one 1,000-kVA transformer. (January 15th.)

Bedwas.—February 11th. Bedwas and Machen U.D.C. Electricity Department. H.p. transmission line, l.p. distribution, h.p. and l.p. switchgear and static transformers. (See this issue.)

Belfast. — February 20th. Electricity Department. Twelve months' supply of stores, &c., including electrical accessories, lamps, carbon brushes, electricity meters, &c. (See this issue.)

Chesterfield.—February 13th. Electricity Department. One 1,000-kW rotary converter equipment. (See this issue.)

Clitheroe.—February 23rd. Corporation. Transformers, switchgear, and cable connections for sub-station; e.h.p. and l.p. cables, boxes, &c. (January 15th.)

Croydon. — February 4th. Electricity Department. 25,000 tons of coal suitable for chain-grate mechanical stokers over a period of 12 months. (See this issue.)

Faversham.—February 12th. Electricity Department. Cables. (See this issue.)

Grimsby. — January 30th. Electricity Department. 500-kW traction converting plant, sub-station e.h.p. switchgear, e.h.p. feeder and pilot cables. (January 15th.)

Halifax.—February 20th. Markets and Parks Committee. Electrical engineering work in connection with the erection of the public abattoirs. Particulars from Borough Engineer, Crossley Street.

India.—March 8th. India Store Department. 40 electric freight locomotives in connection with the G. I. P. Railway electrification. (January 15th.)
February 5th. Punkah motors, a.c. (January 22nd.)

Kilmarnock. — Ayrshire Electricity Board. Supply, delivery and laying of h.p. cables and ducts in the Burghs of Ayr and Prestwick, also transformer kiosks and section pillars. (January 22nd.)

Leeds.—February 1st. Board of Guardians. Supplying and laying underground l.p. cables at the Institution, Beckett Street. (January 22nd.)

London.—HAMMERSMITH.—February 10th. Electricity Department. Stores for 12 months, including electric light sundries, insulated wire, joint boxes, meters, l.p. cables, &c. (January 22nd.)
ISLINGTON.—February 8th. Electricity Department. One 10,000-kW, 3-phase turbo-alternator, condensing plant, condensate circulating exhaust, steam and water pipes, &c. (January 22nd.)
METROPOLITAN WATER BOARD.—February 8th. 12 months' supply of electric lamps. Forms of tender from the Chief Engineer, 173, Rosebery Avenue, E.C.1.
LONDON COUNTY COUNCIL.—February 22nd. H.p. switchgear for Lewisham tramway sub-station. (January 22nd.)

Newark-upon-Trent.—February 10th. Electricity Department. E.h.p., medium, and l.p. mains and distribution network, with street-lighting mains and accessories, single- and three-phase house-service pattern meters, two 250-kVA transformers, e.h.p., 11,000-V switchgear. (January 22nd.)

New Zealand.—WELLINGTON.—Public Works Department. April 6th. Storage battery, motor generator, and switchboard for the Penrose sub-station.*
March 23rd. Five oil filters, 5 oil-testing equipments, and 5 filter-paper drying ovens.* 22,000-V switchgear and equipment for Penrose sub-station.*

Plymouth. — February 4th. Electricity Department. One 6,000-kW turbo-alternator, condenser, &c.; one 350-kW converter. (January 15th.)
February 17th. Electricity Department. Twelve months' supply of electricity meters, cables and transformers. (See this issue.)

Retford.—February 19th. East Retford Gas, Water and Electricity Department. Electricity generating plant, mains, transformers and meters. (January 22nd.)

South Africa.—JOHANNESBURG.—February 25th. Municipal Council. Four d.c. switchgear panels and 3-phase, truck-type ironclad switchgear panels.*
February 25th. S.A. Railways and Harbours. Two 4-ton electrically-driven fixed wharf cranes for Luderitz jetty.*
PRETORIA.—February 25th. Postmaster-General's Department. Supply of a manual telephone exchange for Hatfield, Pretoria. Controller of P.O. Stores, Pretoria.—*S.A. Mining and Engineering Journal.*
February 25th. Union Tender Board. Miscellaneous telegraph and telephone materials (C×1880).*

Uruguay.—MONTEVIDEO.—February 26th. State Electricity Works. Diesel oil engine and a direct-coupled generator.*

Watford.—February 23rd. Board of Guardians. Electric lighting installation, consisting of wiring old buildings, new power mains, motors, main switchboard, &c. Specifications from the Master's office, 60, Vicarage Road, Watford, or from the consulting engineer, Mr. W. M. Benny, 39, Carlton Road, Putney, S.W.15.

*Further particulars can be obtained at the Department of Overseas Trade (Inquiry Room), 35, Old Queen Street, S.W.1.

Closed.

Australia.—MELBOURNE.—State Electricity Commission of Victoria.
Switchgear and accessories.—A. Reyrolle & Co., Ltd. (£21,095); English Electric Co. of Australia (£31,443); Metropolitan-Vickers Electrical Co., Ltd.
3,000-kVA transformers and spares (£34,092).—Johnson & Phillips, Ltd.
6,600-V transformers and spares (£14,351).—Weymouths, Ltd.

Melbourne and Metropolitan Tramways Board.
Storage battery plates (£7,892).—Tudor Accumulator Co., Ltd.

At the City Council meeting last month, the Electricity Supply Committee recommended the acceptance of a tender for the supply of a 6,000-kW turbo-alternator by Messrs. C. A. Parsons & Co., Ltd. Thirty-one tenders were received, including one from Thompsons Engineering and Pipe Co., Ltd., for a Metropolitan-Vickers designed machine of 5,000 kW, partly made in Australia. Although it was stated that the landed price and running costs of the Parsons' machine was considerably less than the lowest Australian tender (Messrs. Thompsons', Castlemaine), there was a strong feeling in the City Council against accepting the recommendation. The consideration of the matter has, therefore, been postponed, in order to enable the Council to obtain further information.—*Industrial Australian and Mining Standard.*

Postmaster-General's Department.—According to the *Sydney Morning Herald*, tenders involving an expenditure of more than £400,000 for the erection of automatic telephone exchanges and the supply of telephone equipment have been accepted by the Postmaster-General's Department. The following are the principal tenders accepted :—
Supply of automatic private branch exchange requirements, New South Wales (£10,640); automatic telephone exchange equipment for Randwick, Waverley, and Gordon (New South Wales) (£125,117).—Automatic Telephones, Ltd. Erection, supply, &c., of automatic telephone exchanges, South Australia (£101,429).—British General Electric Co., Ltd. Erection, supply, &c., of automatic exchanges, Unley and Norwood (S.A.) (£141,680) and Deewhy (N.S.W.) (£9,406).—Western Electric Co. (Aust.), Ltd.

SYDNEY.—City Council.
L.p. underground cables (£6,817).—W. T. Henley's Telegraph Works Co., Ltd.

New South Wales Government Railways.
Two 3,000-kVA rotary converter sets, &c. (£23,169).—Australian General Electric Co., Ltd.
—*Tenders.*

Belgium.—Keen international competition was again shown last week for a contract for 10 kilometres of h. and l.p. armoured cables for the municipal authorities of Schaerbeek, Brussels, tenders being received from Dutch, British (Callender's Cable & Construction Co., Ltd.), Czecho-Slovakian, French, Belgian, and German concerns. The lowest offer, however, was that of a home firm, the Société des Ateliers de Construction Electriques de Charleroi.

Brighton.—Tramways Committee. Recommended:—
100 tons of steel girder tram rails (£9 2s. 6d. per ton).—Anglo-Belgian Improvements Corporation.
The prices of the two British firms who tendered were £10 14s. 6d. and £11 per ton respectively.—*Sussex Daily News.*

Brimsdown.—According to the *Daily Mail*, a contract for a super generating station for the North Metropolitan Electric Supply Co. at Brimsdown, to cost £300,000, has been placed with International Combustion, Ltd. It is stated that the Brimsdown station will be the largest in the country using exclusively the pulverised coal system.

Croydon.—Electricity Committee. Recommended:—
Circulating water piping (£558).—Mechans, Ltd.

Dublin.—Electricity Department. Accepted:—
Flame arc lamps.—General Electric Co., Ltd. (£506); Photector Co., Ltd. (£550).
Maintenance of electricity meters for 12 months (£700).—General Electric Co., Ltd.
Single-phase transformers.—British Electric Transformer Co., Ltd.
3-phase transformers.—British Electric Transformer Co., Ltd.; J. G. Statter & Co.
—*Irish Builder and Engineer.*

Dundee.—Housing Committee. Accepted:—
Electric lighting of new houses (£1,015).—R. M. Lindsay & Co.; D. J. Macdonald, Ltd.

Falkirk.—Town Council. Accepted:—
Electrical work in connection with the housing scheme (£271).—J. P. Simpson.

Government Contracts.—The following Government contracts were placed during December, 1925 :—

ADMIRALTY CONTRACT AND PURCHASE DEPARTMENT.
Battery gear.—D.P. Battery Co., Ltd.
Inert cells.—General Electric Co., Ltd.
Air compressors.—Belliss & Morcom, Ltd.
H.p. fans.—James Keith & Blackman Co., Ltd.
Motor generators and panels.—W. H. Allen, Sons & Co., Ltd.
300 b.h.p. motors, &c.—Laurence Scott & Co., Ltd.
Motors, &c.—Crompton & Co., Ltd.
Electric radiators.—Edison Swan Electric Co., Ltd.

WAR OFFICE.
Secondary batteries.—Pritchett & Gold & E.P.S. Co., Ltd.
Inert cells.—Siemens Bros. & Co., Ltd.
Resistance frame.—E. F. Moy, Ltd.
Generating set and spares.—Newton Bros., Ltd.; Small Electric Motors, Ltd.
Installation of electric lighting, Caterham Barracks.—Alpha Manufacturing and Electrical Co., Ltd.

AIR MINISTRY.
Generators, &c. (Kidbrooke).—Electric Construction Co., Ltd.
Underground cables (Catterick).—G. E. Taylor & Co., Ltd.
Petrol-electric sets.—Stuart Turner, Ltd.
W./t. valves.—Mullard Radio Valve Co., Ltd.
Voltmeter.—E. Turner.

POST OFFICE.
Manufacture, supply, drawing-in and jointing cable.—Tottenham-Walthamstow, Western-Riverside, and Eltham-Sidcup Junction: W. T. Henley's Telegraph Works Co., Ltd.
Manufacture, supply, laying, &c., land and submarine cable.—Anglo-French (1926); Siemens Bros. & Co., Ltd.
Electric goods lift.—Manchester (Newton Street sorting office): W. Wadsworth & Sons, Ltd.
Electric lighting.—Halifax P.O. and telephone exchange: Headen and Brennand.
Radio receivers.—St. Albans radio station: Marconi's Wireless Telegraph Co., Ltd.
Telephone exchange equipment.—Franklin (London), S.W., Portsmouth, Willesden, Nottingham: Automatic Telephone Mfg. Co., Ltd. Sub-contractors: Tudor Accumulator Co., Ltd., for batteries; Crompton and Co., Ltd., for charging machines; Newton Bros. (Derby), Ltd., for ringing machines. Dartford: Automatic Telephone Mfg Co., Ltd. Sub-contractors: The D.P. Battery Co., Ltd., for batteries; Electric Construction Co., Ltd., for charging machines; Newton Bros. (Derby), Ltd., for ringing machines. Sydenham, S.E.: Standard Telephones and Cables, Ltd. Manchester (relief): General Electric Co., Ltd. Leicester: Siemens Bros. & Co., Ltd. Sub-contractors: Chloride Electrical Storage Co., Ltd., for batteries; English Electric Co., Ltd., for charging machines; Crompton & Co., Ltd., for ringing machines. Romford: British L. M. Ericsson Mfg. Co., Ltd. Wigston, Syston, and Western Park (Leicestershire): Siemens Bros. & Co., Ltd.
Private branch exchange equipment.—Owen Owen, Ltd. (Liverpool); Lewis, Ltd. (Manchester); Spillers & Bakers, Ltd. (Bristol); Watney, Combe, Reid & Co., Ltd. (Pimlico, S.W.); Newton, Chambers and Co., Ltd. (Thorncliffe Colliery, near Sheffield); Hawkes & Son (London and Edgware): Relay Automatic Telephone Co., Ltd.
Telephone repeater station.—Four-wire repeater equipment: General Electric Co., Ltd.
Telephone apparatus.—Automatic Telephone Mfg. Co., Ltd.; British L. M. Ericsson Mfg. Co., Ltd.; Peel-Conner Telephone Works; Phœnix Telephone & Electric Works, Ltd.; Plessy Co. (1925), Ltd.; Siemens Bros. & Co., Ltd.; Standard Telephones & Cables, Ltd.; Sterling Telephone and Electric Co., Ltd.; Telephone Mfg. Co., Ltd.
Testing and protective apparatus.—Peel-Conner Telephone Works; Telephone Mfg. Co., Ltd.

Battery stores.—D.P. Battery Co., Ltd.
Cable.—British Insulated Cables, Ltd.; Connollys (Blackley), Ltd.; Enfield Cable Works, Ltd.; W. T. Glover & Co., Ltd.; Hackbridge Cable Co., Ltd.; Johnson & Phillips, Ltd.; Pirelli-General Cable Works, Ltd.; St. Helens Cable & Rubber Co., Ltd.; Siemens Bros. and Co., Ltd.
Loading coils.—Standard Telephones & Cables, Ltd.
Telephone cords.—Phœnix Telephone & Electric Works, Ltd.
Ducts.—Doulton & Co., Ltd.; Hepworth Iron Co., Ltd.; Jas. Oakes and Co., Ltd.; Oates & Green, Ltd.
Earth plates.—Walkers, Parker & Co., Ltd.
Solder.—British Insulated Cables, Ltd.
Wallboards.—Venesta, Ltd.
Bronze wire.—T. Bolton & Sons, Ltd.; British Insulated Cables, Ltd.; Elliott's Metal Co., Ltd.; R. Johnson & Nephew, Ltd.; Shropshire Iron Co., Ltd.; F. Smith & Co., incorporated in the London Electric Wire Co. & Smiths, Ltd.

H.M. OFFICE OF WORKS.

Electric mains, Invergordon housing estate.—Siemens Bros. & Co., Ltd.

CROWN AGENTS FOR THE COLONIES.

Cable.—W. T. Henley's Telegraph Works Co., Ltd.; Callender's Cable and Construction Co., Ltd.
Ceiling fans, &c.—General Electric Co., Ltd.
Train-lighting equipment.—J. Stone & Co., Ltd.
Telephone apparatus.—Standard Telephones & Cables, Ltd.; Telephone Mfg. Co., Ltd.; Peel-Conner Telephone Works; British L. M. Ericsson Mfg. Co., Ltd.

Glasgow.—Housing Committee. Recommended:—
Electrical installations in connection with the housing schemes at Balornock and Possil (£575 and £1,109 respectively).—R. Mickel.

Hemel Hempstead.—Town Council. Accepted:—
Installing electric lighting at Boxmoor Hall.—H. G. Gibbons & Sons.

Ilkeston.—Ilkeston and Heanor Water Board. Accepted:—
Electrically-driven borehole pump.—Mirrlees, Watson Co., Ltd.

London.—STEPNEY.—Electricity Supply Committee. Recommended:—
50 cast-iron boxes, frames, and covers (£97).—E. & F. Wright, Ltd.
50 tons of pitch (£150).—Smart's Tar Distillery.
27,000 tons of best Scotch washed peas and/or Blairhill washed nuts and washed small (19s. 9d. per ton).—W. Cory & Sons, Ltd.
23,000 tons of best Wemyss Scotch washed peas (20s.).—E. Foster & Co.

Northampton.—Education Committee. Accepted:—
Installing electric lighting at Military Road schools (£184).—Lowke & Sons.

Peterborough.—Town Council. Accepted:—
50-ton crane (£1,754).—Herbert Morris, Ltd.
L.p. switchgear (£8,666).—English Electric Co., Ltd.

Richmond-on-Thames.—Town Council. Accepted:—
Installation of electric lighting at the water works buildings.—Richmond Electric Light & Power Co., Ltd.

South Africa.—DURBAN.—South African Electricity Commissioners.—A contract for the erection of part of the equipment for the new super-power station at Durban has been placed with International Combustion, Ltd. (£250,000 approx.).

Tynemouth.—Electricity Committee. Accepted:—
Cables (£463).—Hackbridge Cable Co., Ltd.

Worthing.—Electricity Committee. Accepted:—
Diesel engine with B.T.H. generator (£12,635).—Mirrlees, Bickerton and Day, Ltd.

Forthcoming Events.

Junior Institution of Engineers.—Friday, January 29th. At 39, Victoria Street, S.W. At 7.30 p.m. Paper on "Comfort in Railway Travel from the Point of View of the Engineer," by Mr. A. N. Moon.
Friday, February 5th. Questions and discussions evening.

Institution of Welding Engineers.—Friday, January 29th. At the Philosophical Hall, Park Row, Leeds. At 7 p.m. Paper on "The Arc Welding of Seams in Steel Plates," by Mr. J. T. Carr.

Glasgow Corporation Electricity Department Engineering Society.—Monday, February 1st. At the Welfare Hall, St. Andrew's Cross Works. At 7.45 p.m. Paper on "Non-Ferrous Alloys in Relation to Engineering," by Mr. H. McEwen.

Society of Engineers.—Monday, February 1st. At Burlington House, W. At 5.30 p.m. Presidential address by Mr. G. O. Case.

Paisley Association of Electrical Engineers.—Tuesday, February 2nd. At 16, High Street, Paisley. At 7.30 p.m. Paper on "Control of Motors for Special Purposes," by Mr. D. Fife.

Roentgen Society.—Tuesday, February 2nd. At 32, Welbeck Street, W. At 8.15 p.m. Ordinary meeting.

National Association of Supervising Electricians.—Tuesday, February 2nd. At the Junior Institution of Engineers, 39, Victoria Street, S.W. At 7.15 p.m. Annual general meeting.

Electrical Society of Glasgow.—Tuesday, February 2nd. At Glasgow. Paper on "Internal-combustion Engines," by Mr. A. H. Crowther.

Edinburgh Electrical Society.—Wednesday, February 3rd. At the Royal Society of Art, 117, George Street. At 8 p.m. Paper on "The Influence of Light in Industry and Commerce," by Mr. H. E. Hughes.

Royal Society of Arts.—Wednesday, February 3rd. At John Street, Adelphi, W.C. At 8 p.m. Lecture on "Investigations in Agricultural Science at Rothamsted," by Sir E. J. Russell, F.R.S.

Institution of Electrical Engineers.—Thursday, February 4th. At the Institution, Victoria Embankment, W.C. At 6 p.m. Papers on "Power Factor and Tariff," by Mr. E. V. Clark; and on "Power Factor Improvement," by Mr. E. W. Dorey.

(Wireless Section).—Wednesday, February 3rd. At the Institution, Victoria Embankment, W.C. At 6 p.m. Paper on "The Propagation of Electric Waves," by Mr. J. Hollingworth.

(North-Eastern Centre).—Friday, February 5th. At Tilleys, Blackett Street, Newcastle. At 7 for 7.15 p.m. Annual dinner and reunion.

(North-Western Centre).—Tuesday, February 2nd. At the Engineers' Club, Manchester. At 7 p.m. Papers on "Power Factor and Tariff," by Mr. E. V. Clark; and on "Power Factor Improvement," by Mr. E. W. Dorey.

(Western Centre).—Monday, February 1st. At the Merchant Venturers' Technical College, Bristol. At 6 p.m. Paper on "Testing of Static Transformers," by Mr. J. L. Thompson.

(North-Midland Students' Centre).—Tuesday, February 2nd. At the University, Leeds. At 7 p.m. Paper on "Tests on Electrical Plant," by Mr. C. F. Fowler.

Electrical Power Engineers' Association (Southern Division).—Friday, February 5th. At the Institution of Electrical Engineers, Victoria Embankment, W.C. At 7 p.m. Lecture on "The Testing of Switchboard Instruments and Transformers," by Mr. G. Tilstone.

Notes.

The Government Scheme.—CORRECTION.—In the seventeenth line from the end of the leader, on p. 162, for "time press. . " read "line pressure."

Rural Reconstruction.—A conference convened by the Rural Reconstruction Committee was held at Denison House, London, on Saturday last, with Dr. Gilbert Slater in the chair, to consider what steps should be taken to place the committee's policy before the nation, and it was decided to form an Association for this purpose. The objects of the Association are set forth in a book entitled "A National Rural Policy," prepared by a special committee (Noel Douglas, price 2s. 6d.); in this volume, which deals broadly with the existing situation, sets forth a suggested code of principles of reconstruction, and describes an outline policy, there are several references to the rôle of electricity in agriculture. It is regarded as of great importance that the English countryside should be equipped with a complete though inexpensive system of electricity supply, as a national public service; and it is stated that the development of mechanical power on the farm should enable large areas of land at present untilled to be brought into cultivation. The programme included an address by Mr. Montague Fordham, dealing with the standardisation of prices and quality, and the organisation of distribution, and one on "Electricity and Rural Reconstruction" by Mr. R. Borlase Matthews, Wh.Ex., who explained how a supply of electricity could add to the amenities of country life by the provision of adequate lighting and cheap power. He pointed out that electricity generated from coal could be sold more cheaply than that derived from water power, and stated that the average price paid by the Continental farmer was 8d. for lighting and 4d. for power per kWh, but at this price it was cheaper to him than any other source of power or light. For example, a cream separator could be driven electrically for 30 hours at a cost of 4d. If Mr. Baldwin's proposals could be carried out with freedom from political intrigue, this country would be placed in a very favourable position. With the extension of the distribution of electricity, large numbers of people would return to the countryside. The difficulty of obtaining wayleaves offered a greater handicap in this country than in any other, and should receive attention. Mr. Matthews gave some particulars of the Government scheme, and explained the importance of mechanical power to the farmer in view of the high cost of labour and heavy taxation. He said that to-day there were over 500 British farmers who used electricity, and held that by providing the farmer and the country dweller with electricity, the whole nation would be benefited.

Meter Engineers' Technical Association.—At a meeting of meter engineers held at Anderton's Hotel, Fleet Street, London, on January 22nd, under the chairmanship of Mr. G. F. Shotter, it was resolved, after a full and interesting discussion, "that an Association to be known as the Meter Engineers' Technical Association shall be and is hereby formed." It was further agreed that membership of the Association would be open to all fully qualified technical engineers engaged in the electricity supply industry, or in the service of electricity meter or electrical instrument manufacturers. The following were elected to act as officers and members of Council for 1926:—President, Mr. G. F. Shotter; hon. secretary, Mr. G. D. Malcolm; hon. treasurer, Mr. W. E. C. Alliss; Council, Messrs. A. H. Jacks, E. Mathews, G. F. Shotter, J. T. Haynes, E. W. Hill, and W. A. Anderson. The Association will function in a purely technical and scientific capacity, and there is no intention of adopting, either directly or indirectly, any form of protective policy.

Automatic Steering of Ships.—An invention for the automatic steering of ships made by a London engineer, Mr. J. W. Kirkland, will, it is claimed, take the place of the gyroscope compass now in use in many big vessels. It is based on the use of two valves set at an equal angle with the keel. They are so adjusted that the electric currents passing through them to relays which operate the steering gear are exactly neutralised. If the ship deviates from its course the change in the earth's magnetic field is sufficient to upset the balance and the motor operating the rudder is set in action. With this apparatus, says the *Daily Mail*, the course of a ship can be set and the vessel then steers itself automatically.

Appointments Vacant.—Scientific assistant for research in connection with electrical ignition appliances (£250+) for the R.A.F. establishment, South Farnborough. Consumers' engineer (£457) for the Southampton Corporation Electricity Department. Plumber-jointer for the Borough of Furness Electricity Department. Shift charge engineer for the Bath Corporation Electricity Department. Shift charge engineer for the Corporation Electricity Works, Gt. Yarmouth. Mains superintendent (£428) for the Tunbridge Wells Corporation Electricity Department. Temporary engineer-in-charge for the Worcester City Electrical Works. (See our advertisement pages to-day.)

Electricity Supply Rifle League.—The following were the final scores of the teams in connection with the League championship for the past season:—*1st Division*: Central A 5,892, County 5,832, Shoreditch 5,830, City A 5,755, St. James 5,640, Central B 5,535. Central A and County head the list with 18 points each. *2nd Division*: City B 5,126, Central C 5,099, Shoreditch B 4,934, Hackney 4,886, St. James' A 4,854, Epsom 2,061. City B heads the list with 16 points.

Local Society.—The Edinburgh Electrical Society held its annual social evening, including a whist drive and dance, on January 8th in the Albyn Rooms, Edinburgh. Whist prizes were supplied by the Edison Swan Electric Co., Ltd., the General Electric Co., Ltd., the Sloan Electric Co., Messrs. Baxendale & Co., Ltd., Messrs. Aikman & Co., Ltd., and Messrs. Crabtree. By a coincidence Mr. Sharp, the Scottish representative of Messrs. Crabtree, won the prize presented by his firm. A thoroughly enjoyable evening was spent, music being provided by a special orchestra.

Mining Electrical Engineers' Dinner.—The annual dinner of the South Wales Branch of the Association of Mining Electrical Engineers was held at Cardiff on January 16th, when Mr. A. C. MacWhirter, M.I.E.E., the branch chairman, presided, and Mr. Theodore Stretton, M.I.E.E., president of the Association, was the guest of the evening. Mr. Stretton, in reply to the toast of the "Association of Mining Electrical Engineers," proposed by Mr. D. Hannah, said that the South Wales branch of the Association was in a very healthy condition and was the second largest in the country. Accidents were becoming fewer, and where they did occur they were almost in every case attributable to carelessness. The Association was concerned in the question of diminishing electrical accidents, but it was also essentially a matter of individual interest. Mr. Idris Jones proposed "Kindred Associations," and remarked that the branch was greatly indebted to the technical institutions for the kindly help extended to it. Mr. C. T. Allan, in responding, declared that he was looking forward to the time when they would have one institution of engineers to which all the various branches could be affiliated as constituent sections. Major Ivor David proposed the health of the chairman.

Shipping Coal in South Wales.—Mr. J. Auld's recent paper before the Institute of Transport, describing developments in the shipment of coal at the South Wales ports contained nothing novel; it is an account of a very definite effort which has been made by the Great Western Railway Co. to place the handling of mineral traffic over its system, and especially in South Wales, on a sound economic basis. The Railways Act of 1921 and the subsequent grouping constituted the Great Western Railway Co., the owner of the largest dock system in the world. Previously, the whole of the dock working in South Wales had been carried out by independent companies, and the total tonnage dealt with at these docks in a normal year is round about 50,000,000.

The method of shipping coal by hoisting at either end, or side-tipping, the railway wagon is often criticised, although the operation is quite a common one, both in this country and in America. The principal objection is that unnecessary work is done. Electrically-driven conveyor belts are being tried out by the Great Western Railway Co., although this method does not find universal favour with the shippers where large coal is being dealt with.

At present there are four hoists to serve a length of quay of 900 ft., although when this side of the dock is fully equipped there will be 11 hoists. Some parts of the gear are driven by electric motors, others being operated by hydraulic power. As there were already 10 power stations, it was decided to do away with six of them by modernising one which would work in conjunction with the other three. As there was bound to be a fairly constant demand for pressure from this station, it was decided to install electrically-driven multi-stage turbine pumps absorbing 575 b.h.p., supplied with three-phase, 50-cycle alternating current purchased from the Cardiff Corporation.

Possibly the Great Western Railway Co. may be criticised for extending the use of hydraulic power, which, in these days, is sometimes apt to be compared unfavourably with electricity. At the whole of the docks under consideration, the Company was committed to the use of hydraulics and, even if it were convinced of the superiority of electricity, a very large amount of capital would be involved if a change were made. Moreover, the author holds that, in certain cases, hydraulically-operated machinery in the hands of semi-skilled men is more trustworthy and easier to maintain than is the case with similar machinery operated electrically. The Company's present policy is that for all general cargo work, where variable loads are handled, and for all belt-conveyor type coal-handling machines, electricity will be used. For the ordinary coaling hoist raising a constant load, the Company, in the meantime, continues to use hydraulic power, although it is investigating the merits of electrically-operated hoists.

Electricity on Board Ship.—The launching of the s.s. *Carnarvon Castle* at Belfast on January 15th, is particularly interesting, because this is the first motor passenger vessel built for the Union Castle Line. When completed, she will accommodate 1,500 passengers, and be equipped with Diesel engines of 20,000 horse power. Electricity is being used very extensively on the boat instead of steam, and all the winches, windlass, and capstans are electrically driven. In case of emergency the lifeboats will be launched by electricity. The cooking will also be done by electricity.

Electric Colliery Winders.—At a recent meeting of the North of England branch of the Association of Mining Electrical Engineers, in Newcastle-on-Tyne, Mr. R. W. Mann, A.M.I.E.E., read a paper on the economics of the problem of coal winding at Northumberland and Durham collieries. He compared the advantages of steam and electricity for winding plant, and expressed the opinion that the electrically-operated plant was, under local conditions, the better arrangement.

Accident Prevention.—Valuable work is being done by the Accident Prevention Department of the National Employers' Mutual General Insurance Association, Ltd., London, which issues a large variety of posters printed in colours designed to interest workers in practices and conditions which tend to ensure safety. The department offers service to any industrial company desirous of preventing accidents, and it is

A Safety-First Poster.

claimed that the efficacy of the service is such that reductions ranging from 40 to 87 per cent. on a man-hours-worked basis have been obtained. A number of companies in the electrical industries are associated with the Department. We reproduce herewith on a miniature scale one of the posters, which are issued weekly. A large variety of designs to suit different occupations is constantly being produced.

The British Association.—It is announced that Sir John Snell, chairman of the Electricity Commissioners, is to be president of the Engineering Section at this year's meeting at Oxford.

Corrosion of Lead Cable in Sea Water.—The corrosion of lead used as a covering for cables or other conductors in sea water is a subject of considerable importance, and in this connection a particular case is of interest. About 20 years ago a lead pipe was laid from the water works at Rio de Janeiro to the Ilha das Cobras which crossed an arm of the sea about 200 yards wide, the pipe being used to carry drinking water to the island. The pipe was 65 mm. in diameter, and the thickness of the pipe wall was 6 mm.; it was protected with an impregnated jute covering and an armouring of galvanised wire which, again, was covered with impregnated jute protection. In 1923 it was noticed that the water delivered from this pipe had a distinct salt taste and on making an examination of the pipe it was discovered that in several places (where the pipe was free in the water) the armouring had been completely destroyed and in the lead pipe itself were several holes, through which the sea water entered and mixed with the fresh water. The depth of water covering the pipe was about 4 metres above the parts which had been corroded. In seeking to ascertain the reason for this corrosion the investigators were at first puzzled to account for it, and were inclined to think that it was due to the very large number of molluses which had attached themselves to the pipe. However, it was noticed that corrosion of the pipe and its coverings had taken place only where the pipe lay free in the water, and that where the pipe had been covered with sand or mud no damage had occurred, either to the pipe or the armouring. This led to the conclusion that the corrosion was due to chemical action of the air contained (in the form of bubbles) in the sea water, and that the fact that covered portions of the pipe had escaped damage was due to the protection from this air given by the sand or mud in which it was buried. A contributing cause was also considered to be a small amount of tin in the lead which was unequally distributed through it, and which, in the presence of sea water, would set up electrolytic decomposition. In this case the corrosion became apparent after 20 years' use, but a lead cable laid under similar circumstances became unusable in a much shorter time because of the penetration of the salt water through the outer covering. The movement of sea waves reaches a depth of as much as 20 metres, and even at this depth the sea water contains minute air bubbles. On the assumption that it is this air in the sea water that accelerates corrosion it is recommended that in laying a lead pipe or cable in shallow sea water, they should so far as is possible, be placed where they are likely to become covered by sediment, or if this is not practicable, the lead should receive a specially thorough protection.—*Elektrische Nachrichtentechnik*, Vol. 2, No. 6, 1925.

Fatality.—At the Horsea Island radio station, Portsmouth, on January 23rd, a naval telegraphist, H. C. Taylor, was found dead in the transmitting room. It is believed that he had come into contact with wires carrying a current at 20,000 V.

The P.O. Telegraph Lines and Linesman.—The accompanying illustration represents that very imposing individual, the telegraph linesman of the "fifties." When on duty he carried, according to the *Manchester City News*, a set of one-man-gang tools, ladder, spanner, draw-tongs, draw-vice, cutting-pliers, wire, fire-pot, &c. In those days the P.O. lines

A Telegraph Linesman of the "Fifties."

were all overhead and the linesman was as important a personage as his successor of the present day. The latest P.O. returns show that there are now 3,657,000 miles of underground cables on its communication system, as against 1,063,000 miles of overhead line. The programme of underground extension is being advanced as rapidly as possible.

Electric Haulage Systems in Chile.—The Andes Copper Company at Potreillos, Chile, and the Chile Exploration Company at Chuquicamata, Chile, have just placed orders for 23 industrial electric locomotives, for the purpose of inaugurating the electrification of the haulage systems at these two mining properties. The former company requires eight 10-ton trolley-type locomotives and two 15-ton battery type locomotives. The Chile Exploration Company has ordered six 70-ton combination trolley and battery-type locomotives, three 25-ton pusher-type locomotives with sub-station equipment and switchgear, and four small battery locomotives. All of these locomotives are to be built jointly by the Westinghouse Company and the Baldwin Locomotive Works. The complete electrification eventually will require some 50 additional 70-ton locomotives, to be used in moving cars of copper ore from the electric shovels at the mine to the mill and in general haulage about the plant. These large locomotives are the first of the combination type to be built with articulated or connected trucks, a construction hitherto used only on powerful railroad locomotives. Power at 600 volts d.c. is furnished to the locomotives by a third-rail system, and when the locomotive reaches the end of the third rail the shoe used to collect the current is automatically picked up and the locomotive propelled by current drawn from the storage batteries it carries.

The smaller pusher locomotives are designed to run on a narrow gauge track alongside of the tracks upon which the ore cars are operated. An arm on the pusher locomotive may be swung behind a car on the adjacent track and the car "spotted" for unloading at any desired place. This does away with the necessity of moving an entire train of cars in order to move any particular car to a certain location. These locomotives and the 70-ton type utilise duplicate equipment wherever possible.

The electric power for this haulage system of the Chile Exploration Company is generated by steam turbines and oil-fired boilers located on the seacoast at Tocopilla, 75 miles away, and transmitted to the mining property at 110,000 volts.

Both of these mines are the property of the Anaconda Copper Company.

B.E.S.A. Specifications.—The British Engineering Standards Association has recently issued the following specifications:—No. 216, 1926, Vulcanised Fibre for Electrical Purposes, and No. 231, 1925, Pressboard for Electrical Purposes. These publications, together with the recently-issued specification for ebonite for radio purposes (No. 234), are the first of a series of British standard specifications for electrical insulating materials. The preparation of these specifications has entailed a large amount of research work on the properties of insulating materials, and the values given, together with the methods of testing, have been based on the results of the researches carried out by the British Electrical and Allied Industries Research Association. These methods of testing have been devised for the guidance of all interested to secure the best available methods of test in the development of improved material, and uniformity of practice so that data obtained by different observers may be comparable. Specification No. 231 applies to non-impregnated pressboard only. The preparation of a specification for pressboard impregnated during manufacture with varnish, oil, wax and the like, is under consideration. Copies of these publications may be obtained from the B.E.S.A. Publications Department, 28, Victoria Street, S.W.1, price 1s. 2d. each, post free.

Electrical Association for Women.—On Saturday last a musical afternoon was held by the Association at Aeolian Hall, London, the chairman being Mrs. Wilfrid Ashley, vice-president. The programme included performances on the electric "Duo-Art" pianola piano, played as an ordinary piano by Mr. H. V. Spanner, M.R.C.O., L.R.A.M., and also reproducing records by famous pianists as an electric piano. In addition to these items, which were rendered with excellent technique, addresses were given on "Electricity and Music" by Mrs. M. L. Matthews, Graduate I.E.E., and on "Music in the Home" by Mr. H. V. Spanner. There was a large attendance, including some well-known electrical engineers, and the demonstration of the reproduction of good music in the home was very enjoyable and instructive.

Educational.—BOROUGH POLYTECHNIC INSTITUTE.—The annual prize distribution will be held at the Institute, Borough Road, S.E., on Friday, February 12th, at 7.30 p.m.

Electrical Research Association.—The annual general meeting of the British Electrical and Allied Industries Research Association will be held at the Savoy Hotel, London, on Friday, February 12th.

Institution Notes.

Institution of Electrical Engineers.—INFORMAL CONCERT CANCELLED.—The smoking concert that had been arranged to be held on March 15th at the Engineers' Club has been cancelled by the Informal Meetings Committee.

Junior Institution of Engineers.—On January 22nd, Mr. E. Granville-Smith delivered a lecturette on the subject of "The Engineer and his Relation to the Tea Industry." He said that a tea estate engineer would be well advised to have a fair practical knowledge of electricity, steam and oil fuel power, and of the smithy and fitter's shop. He would have to design and erect buildings, and lay down new and repair old machinery. He described briefly the method of tea manufacture, and the machines used on a tea estate.

Our Personal Column.

(Electrical men are invited to enable us to keep readers of the "Electrical Review" posted concerning their movements).

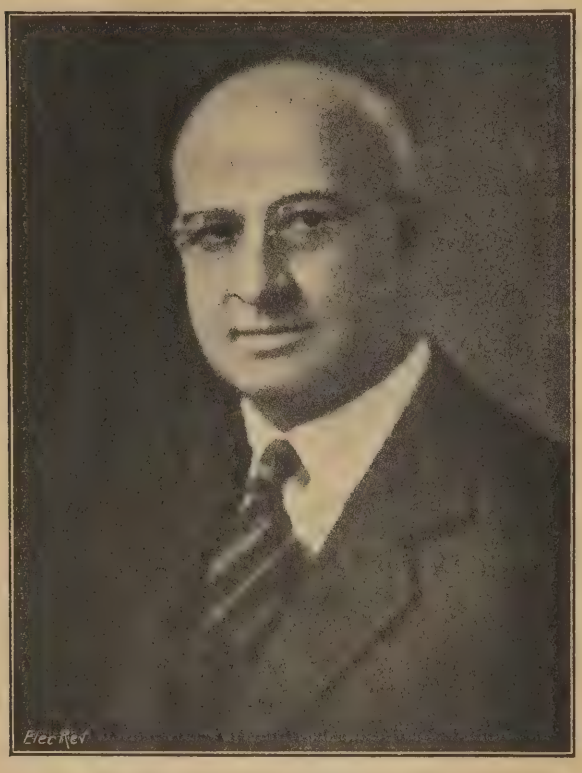
Science reports that the third annual $1,000 prize of the American Association for the Advancement of Science has been awarded to Dr. DAYTON C. MILLER, professor of physics at the Case School of Applied Science, for his presidential address before the American Physical Society on "The Michelson-Morley Ether Drift Experiment."

Mr. WILLIAM L. ABBOTT, chief engineer of the Chicago Edison Company, has been elected president of the American Society of Mechanical Engineers.

Brighton Corporation Lighting Committee recommends that the salary of the borough electrical engineer (Mr. J. CHRISTIE) be increased from £1,500 to £1,650 per annum; and the Tramways Committee recommends that the salary of the engineer and manager (Mr. W. MARSH) be increased from £640 to £700, with a further £50 in twelve months' time.

Peterborough City Council has appointed Mr. R. B. CANNING as resident engineer to act under the supervision of the electrical manager in connection with the extension of the power station, at a salary calculated at the rate of £600 per annum.

Mr. W. HAINSWORTH, of Stoke-on-Trent Corporation Electricity Department, has been appointed to the position of commercial assistant at Croydon Borough Electricity Department.



The Council of the Institution of Electrical Engineers has made the fifth award of the Faraday Medal to Colonel R. E. B. CROMPTON, C.B., honorary member of the Institution. The Faraday Medal is awarded by the Council of the Institution not more frequently than once a year, either for notable scientific or industrial achievement in electrical engineering or for conspicuous service rendered to the advancement of electrical science without restriction as regards nationality, country of residence, or membership of the Institution. Colonel Crompton, who has twice been president of the Institution, is one of the early pioneers of electrical engineering, and has played an outstanding part in the development of electricity supply in this country.

Three chief officials of the Leeds Corporation Tramways Department have just retired on pension.—Mr. J. BURBRIDGE, electrical engineer to the department; Mr. J. RAMSEY, line superintendent; and Mr. T. BURNETT, chief inspector. Mr. Burbridge was formerly in the service of the British Thomson-Houston Company in British Columbia, and returned from there when the company electrified—in 1891—the Harehills and Beckett Street section of Leeds tramways, followed by the Sheepscar-Roundhay section, the running beginning on

July 3rd, 1896, when Mr. Burbridge was engaged by the Leeds Corporation. Mr. Ramsey had been in the service of the Corporation since 1893, and Mr. Burnett since 1899.

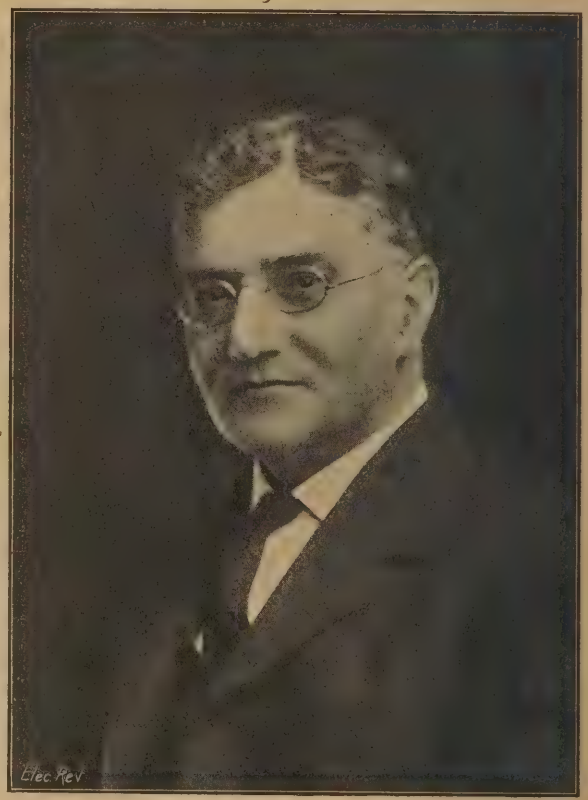
Mr. F. J. PEARCE, who has been with Messrs. George H. Scholes & Co., Ltd., Blantyre Street, Manchester, for 19 years, has been appointed a director of the company.

Accompanying these notes we publish a photograph of Mr. JAMES E. DAVIDSON, president of the National Electric Light Association, reproduced from our contemporary, the *Electrical*

Mr. James E. Davidson.
President of the National Electric Light Association.

World, in which journal Mr. Davidson recently urged upon American electricity supply men the importance of a well-organised operating and sales organisation, as mentioned in our leaderettes to-day.

Sir HOLBERRY MENSFORTH, K.C.B., C.B.E., whom readers will remember as formerly general manager of works with the Metropolitan-Vickers Electrical Co., Ltd., is resigning the post of Director-General of Factories at the War Office at the end of February to take up the position of managing director of Messrs. Bolckow, Vaughan & Co., Ltd., Middlesbrough.



Mr. F. R. TURNER has been appointed to the recently advertised position of shift charge engineer at the West Bank, Widnes, power station of the United Alkali Co., Ltd.

Mr. M. W. SINGER, M.Sc. Tech., having taken up a position with the London branch of Messrs. Erskine, Heap and Co., Ltd., is no longer with Messrs. J. S. Statter & Co., representing the firm of W. Smit & Co., of Nymegen, Holland.

Obituary.—MR. J. VINCENT KITCHENER.—We regret to learn from our contemporary, the *Electric Railway and Tramway Journal*, of the death of Mr. John Vincent Kitchener, which occurred on January 18th, at his residence in Manchester. "Mr. Kitchener was associated with the British Electric Traction Co. for 30 years, having joined the B.E.T. (Pioneer) Co. in 1896, as secretary. He subsequently became district superintendent for Manchester and district, and was latterly a director of the Middleton and some other associated companies of the B.E.T. Co. Mr. Kitchener was associated with the telephone industry in the North of England before joining the B.E.T. Co."

MR. J. BROWNE MARTIN.—We regret to record the death, which occurred on January 20th, at Brighton, of Mr. J. Browne Martin. He was for some years prominently associated with a number of electricity supply companies and many other concerns as chairman or director—among them being the Westminster Electric Supply Corporation, the Central Electric Supply Co., Ltd., and the Smithfield Markets Electric Supply Co., Ltd. He was 91 years of age.

MR. LEONARD G. TATE.—It came to us as a personal shock to learn that Mr. Leonard George Tate, M.I.E.E., passed away on Sunday evening last, aged 60 years. We announced in our last issue that he was to undergo an operation on Saturday. This operation took place, apparently successfully, in a nursing home at Richmond, but he died on the evening of the following day. He was greatly missed at the annual dinner of the Electrical Contractors' Association held on the previous Tuesday, but that, it was hoped, was only a temporary absence. Now, however, the Association as an organisation, large numbers of its members individually, and an even larger circle of friends in other and allied branches of the industry, will feel very keenly the permanent loss which has fallen upon them. If, as Mr. Chattock said at the dinner last week, Mr. Tate was regarded as the father of the Association, our own feelings toward him will be better understood when we remark that the ELECTRICAL REVIEW bore the pangs of motherhood and gave it birth. Mr. Tate will be remembered mainly for his work as general secretary of the E.C.A. Allied Associations and Director of the National Electrical Contractors' Trading Association, Ltd. In the ELECTRICAL REVIEW for January 6th, 1922, we concluded a biographical sketch of his career by describing him as an expert of the first rank with regard to the manifold problems that had arisen affecting electrical contracting interests and stating that that branch of the industry owed much to his unfailing activities on its behalf. He joined the old "National Electrical Contractors' Association" in 1902 and was elected to the "Managing Committee." In this capacity he assisted in the incorporation of the present Association and in the formation of its present constitution. In 1905 he first accepted the position as honorary secretary to the Incorporated Association; and in this capacity he continued to act until 1918, when he severed his connection with the firm of Leonard G. Tate and Company, electrical contractors, of Bucklersbury, E.C. (under which title he had traded from 1894), and became the whole-time general secretary of the E.C.A. Allied Associations. On the occasion of the E.C.A. annual general meeting held in June, 1925, the Allied Associations presented Mr. Tate with a silver salver and cheque "as a token of esteem and mark of appreciation for the valuable services rendered by him during the past 21 years." In making the presentation, Mr. Walter Riggs, then president, paid enthusiastic tribute to Mr. Tate's twenty-one years' active E.C.A. service, very hearty supporting tributes being forthcoming from Mr. T. E. Alger, Mr. H. Willoughby-Ellis, Mr. W. A. Shaw, Mr. R. Robson, Mr. H. J. Miles, Mr. E. M. Parsons, and others. Mr. Tate's

Elliott & Fry] [*London.*

The Late Mr. Leonard G. Tate.

early training was with the Pilsen Joel and General Electric Engineering Company, which he joined in 1883. Here he was engaged in the incandescent lamp department, first under the late Mr. Margary and afterwards with Mr. Charles Robertson, of Robertson lamp fame. One year later Mr. Tate accepted the management of the lamp department of the Schuyler Electric Company of Hartford, Conn., U.S.A., and he remained in America for five years. In 1899 he joined the Brush Electrical Engineering Co., Ltd., under Mr. Dawbarn; and in 1892 he joined Mr. Leslie Fuller in founding the business of Fuller and Tate at 20, Bucklersbury, E.C.; it was this business which Mr. Tate carried on alone as Leonard G. Tate & Company prior to associating himself wholly and wholeheartedly with the E.C.A. Mr. Tate married in April, 1913, and he leaves a widow and three children, for whom we have feelings of the deepest sympathy. The funeral service took place yesterday (Thursday) morning at Richmond Parish Church. It will be remembered that last summer we announced that Mr. Tate had very kindly consented to act as one of the judges (together with Messrs. J. W. Beauchamp and L. L. Robinson) in the ELECTRICAL REVIEW Advertisement Competition. We had hoped that the judging could have taken place this week, but that is not now possible.

Will.—MR. JOHN ASHBY, a director of the Woking Electric Supply Co., Ltd., left £148,720 gross and £88,510 net personalty.

New Companies Registered.

A. Cunningham & Co. (Manchester), Ltd. (211,192).—Private company. Registered January 20th. Capital, £4,000 in £1 shares. Objects: To acquire the business of an electrical engineer and contractor now carried on by A. Cunningham at 129, Rocky Lane, Monton, near Manchester, and elsewhere as "A. Cunningham." The life directors are:—A. Cunningham, 129, Rocky Lane, Monton, near Manchester; H. Rothwell (chairman), St. Keverne, S.O., Cornwall. Qualification of life directors, 1,000 shares; of other directors, 100 shares.

International Mica Syndicate, Ltd. (211,245).—Private company. Registered January 21st. Capital, £1,000 in £1 shares. Objects: To carry on the business of mica importers, exporters, merchants, dealers, brokers, manufacturers, agents, &c. The subscribers (each with one share) are:—E. R. Godar, 110, Castlenau, Barnes, S.W.13, mica importer; C. Anning, 123, Whips Cross Road, Leytonstone, E.11, solicitor's clerk. The first directors are:—G. Fodor (chairman), A. Ormai and E. R. Godar (all permanent, subject to each holding 5 ordinary shares). Solicitors: Walter Burgis & Co., 31, Budge Row, E.C.4. Registered office: 110, Castlenau, Barnes, S.W.13.

The Wireless Association of Great Britain, Ltd. (211,248).—Registered on January 21st as a company limited by guarantee and not having a capital divided into shares, with 1,000 members, each liable for £1 in the event of winding up. The income and property of the Association is to be applied solely towards the promotion of its objects. Objects: To encourage and develop in Great Britain wireless receiving and electrical apparatus and other allied industries, to protect and advance the legitimate interests of users of wireless receivers and listeners-in interested in or associated with the wireless and other allied industries; and generally to afford members all the advantages, conveniences and accommodation of an association and centre of information, instruction and advice on the rights and all matters appertaining to wireless receiving and listening-in, &c. The first directors (to number not fewer than 3 nor more than 20) are:—The Earl of Drogheda, C.M.G., 8, Victoria Road, W.8; Col. R. Halsey, 18, Mount Street, W.1, insurance broker; Major C. P. C. Jarvis, Doddington Hall, Lincoln, member of Lloyds; Lt. L. M. Robinson, R.N. (Retired), Grad. I.E.E., 40, Norfolk Square, W.2, electrical engineer; G. Gordon, 42, Park Lane, W.1, solicitor (all permanent). Remuneration as fixed by the board. Solicitors: Gordon, Dadds & Co., 175, Piccadilly, W.

Western Counties Electrical and Engineering Co., Ltd. (211,219).—Private company. Registered January 20th. Capital, £6,000 in £1 shares (3,000 6 per cent. cumulative preference and 3,000 ordinary). Objects:—To adopt an agreement with F. H. Merritt, and to carry on the business of electrical engineers and contractors, suppliers of electricity, carriers of passengers and goods, manufacturers of, and dealers in railway, tramway, electrical, agricultural, magnetic, galvanic, wireless, and other apparatus, &c. The directors are:—F. H. Merritt, 1, West Park, Yeovil, Somerset; F. H. Walker, 79, Lightwoods Road, Bearwood, Birmingham; E. B. Merritt, 11, Avenue Road, Penge, S.E.20. The first two named are permanent. Qualification, 100 shares. Remuneration, 10 guineas per annum. Secretary: F. H. Walker. Solicitor: E. W. W. Veale, 14, Orchard Street, Bristol. Registered office: Electricity House, 19, Princes Street, Yeovil, Somerset.

Official Returns of Electrical Companies.

Birkdale District Electric Supply Co., Ltd. (70,259).—Capital, £50,000 in £5 shares. Return dated June 18th, 1925. 9,200 shares taken up. £46,000 paid. Mortgages and charges, £6,000, issued to bankers as collateral security.

Julius Sax & Co., Ltd. (63,371).—Capital, £10,000 in 3,000 7½ per cent. preference shares of £1 each and 35,000 ordinary shares of 4s. each. Return dated October 19th, 1925. 2,650 preference and 18,000 ordinary shares taken up. £5,051 paid on 2,650 preference and 12,005 ordinary shares. £1,199 considered as paid on 5,995 ordinary shares. Mortgages and charges, nil.

Charles Fitz-Hugh, Ltd.—H. Brown, of 71, Temple Row, Birmingham, was appointed receiver on January 7th, 1926, under powers contained in debentures dated December 23rd, 1925.

Browning & Lambert, Ltd.—Satisfaction in full on December 10th, 1925, of mortgage dated December 13th, 1919, securing all moneys due or to become due.

Marconi's Wireless Telegraph Co., Ltd.—Satisfaction to the extent of £72,163 between January 1st to December 4th, 1925, of trust deed dated November 17th, 1922, securing £1,500,000.

Oco Electrical Appliances, Ltd.—Debenture dated January 6th, 1926, to secure £250, constituting a specific charge on the company's land in London and all other freehold and leasehold property for the time being and a floating charge on the company's undertaking and other property, present and future, including uncalled capital. Holders: Branch Nominees, Ltd., 15, Bishopsgate, E.C.2.

Magneto Repair Depôt and Motor Works (Christchurch), Ltd.—Particulars filed of £1,500 debentures authorised January 1st, 1926, charged on the company's undertaking and property, including uncalled capital, the whole amount being now issued.

R. & T. Patents, Ltd.—A. A. Whittingham-Jones, of 41, Castle Street, Liverpool, accountant, was appointed receiver and manager in place of S. J. Watson, on December 17th, under powers contained in debenture dated March 26th, 1925.

Houghton's Electrical Engineering Co., Ltd.—F. Tingle, of 14, Bloomsbury Square, W.C., C.A., was appointed receiver and manager on January 13th, 1926, under powers contained in instruments dated July 3rd, 1924, and September 23rd, 1925.

Erith Electrical Co., Ltd.—R. B. Tyler, C.A., of 1, Queen Victoria Street, E.C., was appointed receiver and manager on January 7th, 1926, under powers contained in debentures dated February 23rd, 1925.

Electro Pocket Cinemas, Ltd.—H. Chapman, of 171, High Street, Lowestoft, ceased to act as receiver or manager on December 18th, 1925.

Re-Echo Radio Co., Ltd.—Debenture dated January 4th, 1926, to secure £900, charged on the company's property, present and future, including uncalled capital. Holder: W. Taplin, 187, Holland Road, Willesden, N.W.10.

Peacehaven Electric Light & Power Co., Ltd. (181,255).—Capital, £20,000 in 15,000 10 per cent. preference shares of £1 each and 20,000 ordinary shares of 5s. each. Return dated December 29th, 1925. 14,038 preference and 16,052 ordinary shares taken up. £17,909 18s. 1d. paid. £141 1s. 11d. in arrears. Mortgages and charges, nil.

Europe & Azores Telegraph Co., Ltd. (39,452C).—Capital, £200,000 in £10 shares. Return dated June 24th, 1925. All shares taken up. £144,320 paid. £55,680 considered as paid. Mortgages and charges, nil.

Southern Electric Free Wiring Co., Ltd. (64,550).—Capital, £5,000 in £1 shares. Return dated December 30th, 1925. 1,510 shares taken up. £1,510 paid. Mortgages and charges, nil.

Hexham and District Electric Supply Co., Ltd. (83,869).—Capital, £30,000 in 7,605 "A," 6,479 "B," and 15,916 "C" shares of £1 each. Return dated August 7th, 1924 (filed June 30th, 1925). 7,605 "A," 6,479 "B," and 15,825 "C" shares taken up. £22,430 paid. £6,479 considered as paid. Mortgages and charges, £25,000.

Grierson, Ltd. (180,410).—Capital, £10,000 in 6,000 ordinary and 4,000 preference shares of £1 each. Return dated October 28th, 1925. 2,501 ordinary shares taken up. £2,501 paid. Mortgages and charges, nil.

Shoreham and District Electric Lighting and Power Co., Ltd. ((176,995).—Capital, £27,500 in £1 shares. Return dated December 31st, 1925. 17,329 shares taken up. £10,579 paid. £6,500 considered as paid. Mortgages and charges, nil.

City Notes.

Reports and Meetings of Electrical Companies, Dividend Results, &c.

Ferguson, Pailin, Ltd.

The net profit for the year ended November 30th last amounted to £37,383, and to this is added £24,615 brought forward (after adjustment of corporation profits tax), making £61,998. The interim dividends absorbed £4,302, leaving £57,696 which it is proposed to distribute as follows:—Final dividends at the rate of 9 per cent. on the preference shares (making 8 per cent.) and at the rate of 19 per cent. on the ordinary shares (making 13 per cent.), absorbing £11,250; to reserve, £10,000; to writing down the value of goodwill and patents, £1,215; leaving a balance of £35,231 to be carried forward. The report states that progress was maintained during the past year, and the directors are satisfied with the trading results. The writing-down of the value of goodwill and patents to £1 was effected by means of a premium upon the ordinary shares issued during the year (£4,706) and the amount shown above. The meeting is to be held in Manchester on February 4th.

Chatham and District Light Railways Co.

The report for the year ended December 31st last shows a revenue of £76,833 and a net profit of £9,539, after providing for rent and depreciation. The addition of £1,601 brought forward gives an available balance of £9,936. Interim dividends absorbed £3,900, and it is proposed to distribute the balance as follows:—Final preference dividend, £1,250; 2½ per cent. on the ordinary shares (making 5 per cent. for the year), £2,650; carried forward, £9,396. It is stated that while the expenses increased by £3,160, the revenue showed an increase of only £568. The annual meeting is to be held on February 2nd.

Stock Exchange Notices.—The undermentioned securities have been ordered to be officially quoted:—

American Telephone and Telegraph Co.—$941,100 capital stock.

County of London Electric Supply Co., Ltd.—2,000,000 six per cent. cumulative preference shares of £1 each fully paid, Nos. 2,725,001 to 4,725,000.

Montreal Tramways Co.—$17,826,500 series "A" thirty-year five per cent. general and refunding mortgage sinking fund gold bonds, Nos. M1 to M8,599 and M8,601 to M15,902 ($1,000), D1 to D2,750 ($500) and C1 to C5,505 ($100).

Montreal Light, Heat and Power Co.—A dividend of $2 per share has been declared on the common shares in respect of the quarter ending January 31st.

Elliott's Metal Co., Ltd.—An interim dividend of 1s. per share has been declared on the ordinary shares, as in 1925.

Dublin United Tramways Co., Ltd.—Out of the past year's profits £60,000 has been set aside for track renewal, £7,000 for overhead lines, standards, &c., and £5,000 for cars. A final dividend at the rate of 7 per cent. is being paid, making 5½ per cent. for the year, and £15,230 is being carried forward.

Traction and Power Securities Co., Ltd.—The net revenue for the past year was £52,054, and the addition of £20,083 brought forward makes a total of £72,137 available. A final dividend of 9 per cent. on the ordinary shares is recommended (making 13 per cent. for the year), and the balance (£28,748) is to be carried forward. During the year 4½ per cent. debenture stock to the extent of £65,036 was issued.

Westinghouse Brake & Saxby Signal Co., Ltd.—A dividend of 6 per cent. has been declared as compared with 1¼ per cent. in 1923-24. No dividend was paid in 1922-23.

German Companies.—The *West German Telephone Works Company*, of Düsseldorf, after having made provision for depreciation, reports a net profit of 30,000 marks for 1924-25, which has been carried forward.

The *Berlin Northern and Southern Railway Company*, which belongs to the city and is operated by the Berlin Elevated and Underground Railway Company, reports profits of 1,820,000 marks for 1924, the method of disposal of which is not disclosed.

Western Union Telegraph Co.—The "earnings report" for 1925 (December estimated) shows a total gross revenue of $129,260,353, as compared with $115,235,563 in 1924. The expenses increased from $99,581,556 to $110,753,748, and the net income from $12,336,682 to $15,170,089. A dividend of 2 per cent. has been paid on the capital stock for the quarter ended December 31st last.

A. J. Stevens & Co. (1914), Ltd.—The offer to shareholders of 150,000 ordinary £1 shares at par, and 100,000 cumulative preference shares at 23s. 6d. each, was oversubscribed.

Stocks and Shares.

MONDAY EVENING.

THE course of Stock Exchange markets, like that of a well-known sentiment, never runs smooth for long at a time. At the present juncture, it happens to be labour conditions that press, as a pall, upon the spirits of investor and speculator. The continual jolts which public confidence receives by reason of the railway conferences, are quoted as being such cause for uneasiness as leads, not only to selling, but to marked restraint upon the part of the usual buyers. Cable equipment and electrical manufacturing issues show further rises, and, the upward movement having made very material headway in the last fortnight, some of the previous holders have deemed it prudent to secure the profits that they are offered. As a consequence, the prices show a tendency to halt. In some cases, they have declined from the recent top levels touched.

Nevertheless, there are substantial rises remaining in several instances. Callenders have gained 5s., Henleys and Johnson and Phillips 3/16, Telegraph Constructions—hitherto almost neglected—10s., Metropolitan Vickers 2s. 3d., British Insulated ⅛, and so on. Enfield Cables ordinary have strengthened to 3 7/16. English Electrics went a little over par: Electric Constructions are 1/16 up, Siemens 1s. 6d., and General Electrics put on a shilling. Pause was given to this boomlet by the realisations just mentioned, and by the consideration that, on dividend yields, the movement had gone perhaps far enough for the present. It will be noticed, by reference to our tables, that the return on the money at current prices is very moderate, taken on the basis of the last-paid dividends. To this the optimist naturally retorts that dividends are likely to be increased; that the leading companies are well supplied with orders; and that, when the Government's electricity scheme is working, the equipment undertakings will do remarkably well. Furthermore, he contends, expansion of work will call for the provision of more capital, and he has recently tasted the sweets of new issues made at prices that afforded bonuses. It always seems churlish to damp the ardour of an investor, particularly when he is not of the merely speculative class, so all that shall be said now is to quote the invariable experience of Stock Exchange markets after a good rise has taken place. There are always people ready to sell on the top of such an advance. Events generally prove the wisdom of making sure of a good profit when this accrues.

The market for London electricity supply shares is rather heavy. There are uncertainties and doubts in the present prospect, and these have the effect of bringing to market a certain number of shares from ultra-cautious holders. Falls are marked against the prices of Charing Cross, City, County, South Londons and Westminsters. Kensingtons stand out as the exception to the prevailing disposition, and the price is 15s. higher at 14½. This has resulted in the shares now standing at the top of the London group in relation to the yield on the shares. For a long time, County ordinary have been offering the smallest return, but their place is taken by Kensingtons, which pay £5 1s. 8d. per cent. on the money, while County ordinary give about eighteenpence per cent. more.

The provincial shares remain very firm. Bournemouth and Poole, after their last week's rise of 3s., are another 9d. up. It is assumed that the provincial power undertakings are bound to benefit by the Government's scheme.

It may easily be that the non-technical proprietor (if such there be) of electricity supply and power shares is liable to suffer confusion from the complications introduced by the learned into the newspaper discussions now raging around the various points. Parliament passed, last year, two Acts, Nos. 1 and 2, that settled the future of this branch of the industry. It seems very unlikely that the House of Commons will tolerate interference with legislation that, after years of talk and opposition, has succeeded in reaching the Statute Book. The London and Home Counties Electricity District Order is another step which it is hardly probable will be removed. Provincial supply and power companies should do well, as possessing organisations of which the Government may take advantage. The next announcements are awaited with a curiosity, not untinged with a mild apprehension for which no real warranty exists.

The dividend season of the home railway companies starts this week, with the declaration of the Metropolitan results. The company is expected to repeat the 5 per cent. dividend paid for 1924, but the price is duller on the week, at 68½. Central London ordinary has gained a point at 69, and the Underground issues are unchanged. British Electric Traction ordinary is 2 lower at 117½.

Cable stocks and shares exhibit no feature of fresh interest. Chili Telephones are a good market at 6⅜ ex the dividend. The wireless shares have not changed. We understand that the Eastern companies did exceedingly well with the special facilities that they offered at Christmas time for the transmission, at cheap rates, of greetings by cable. The efforts made to popularise this exchange of seasonable messages were rewarded by prompt public appreciation of the concessions in regard to cost.

Babcock & Wilcox are easier at 53s. 9d. Shares changed hands to-day, Monday, at 52s. 6d. The rubber market is very subdued, owing to the drop in the price of rubber to 2s. 9d. per lb. This compares with 4s. 7d. per lb. as the recent highest touched. Sales of shares in other markets, made in order to meet engagements in the rubber department, are contributing to the somewhat dull tone that prevails in many markets round the Stock Exchange.

How to Sell Electrical Goods.

An E.D.A. Salesmanship Conference.

AT the monthly salesmanship conference of the Electrical Development Association on January 15th, Mr. Ll. B. Atkinson read a paper on "Suggestion and Auto-Suggestion in Salesmanship." Sir Philip Nash presided.

The CHAIRMAN, in opening the conference, said that that day was an important one in the electrical industry on account of the Prime Minister's announcement with regard to the Government's proposals concerning electricity supply. One remark of the Prime Minister which had been reported was an important one, *viz.*, that the generation of electricity was an engineer's task, but the selling of it was a commercial undertaking.

Mr. ATKINSON said that salesmanship was a science of which we were only beginning to have glimmerings. The final aim of all salesmanship was to raise in the minds of all possible purchasers the desire to possess something, which desire, in those whose purchasing power was limited, would be stronger than the desire to possess anything else, or in the case of those of relatively unlimited purchasing power, to excite a desire in a mind already satiated. Thus, salesmanship implied some action on the mind of the possible purchaser, and the study of the science of salesmanship must finally end in the study of the causes which affected the conscious action of the mind. But consideration would show that that conscious mind was not everything. There were actions which were automatic and were brought about by the subconscious mind. He asked his audience to take as proved beyond discussion the fact that under suggestion, mental and physical processes were carried on in an extraordinarily powerful manner of which we had no conscious guidance or control.

The act of suggestion was generally considered from a two-fold point of view. There was auto-suggestion, where the suggestive act was done by an individual in his own case, and there was hetero-suggestion, where the suggestion was made by another. It was agreed, he believed, that in normal people and normal conditions, no such control as the latter existed apart from hypnotism. It was true that in a particular physiological condition known as hypnotism, there seemed to be a control by an outsider of the subconscious mind of another, by which his acts were controlled, but he would not pursue this, as salesmen could not deal with masses of people in an hypnotic condition. Therefore, auto-suggestion was the more important phase, *i.e.*, the planting in the subconscious mind of an individual by his own conscious mind, of the idea which was to fructify in action. There was first, the use of auto-suggestion by a salesman on himself for his own increased usefulness, and, secondly, there was the production of the auto-suggestive action on the sub-conscious mind of those whose actions it was desired to precipitate in the direction of buying the goods. The mental state to be established by auto-suggestion was a deep conviction that what one thought was the absolute truth was necessary and, further, and even more important, the absolute certainty in one's own mind that one would succeed in convincing others. The successful salesman was the man who had a perfect confidence, and absolutely unreasoning certainty in himself that he had already sold the goods and had merely come to fetch the order. An obsession of having always succeeded and of continuing success, was the dominating fact and the dominating necessity in the highest type of salesmanship. How could that mental attitude be attained? The general and most fruitful way was to realise that suggestion must be spontaneous and that those spontaneous suggestions came at moments when the whole body and mind were in a state of relaxation. With relaxation, meditation and contemplation, ideas would come with the minimum of guidance and the subconscious mind would take them up and do the rest.

Passing to the methods of suggestion as they related to the customer, Mr. Atkinson said that if they considered the case of a customer who wanted a specific object, where the decision would rest on his being satisfied as to scientific conditions being fulfilled, there was probably not much scope for suggestion, because the conscious mind was so much to the forefront. All that could be done there was to implant on the conscious mind the advantageous combination of qualities possessed by the article, bringing these into touch with individual predilection, such, for instance, as the saving of trouble, or the convenience to the particular individual, with the intention that at suitable moments this suggestion might present itself to his mind and be impressed on his subconscious mind. But in articles less the subject of detailed specification, and requirements, the implanting of agreeable suggestions relating to profit, comfort, &c., coupled with the particular article being offered, would fruitfully lead to the auto-suggestive act. The same ideas followed for publicity work, and it appeared to him that engineers leaned too much upon the reasoned advertisement or announcement appealing to the conscious mind. Advertisements with attractive illustrations were valuable; they were pictures which began to arise spontaneously in the relaxed, resting and semi-automatic condition, if they were cleverly coupled with the goods which it was desired to sell.

In conclusion, Mr. Atkinson said that the whole question was at a stage when experiment on a larger scale was necessary and in bringing it up for discussion at one of the E.D.A. conferences, he did so in the hope that others would study the methods of suggestion and would experiment on themselves and others. If they did so, he believed they would gradually find systematic lines for the development of a great and ever-acting process for self-improvement and mutual guidance.

Discussion.

In opening the discussion, Mr. H. T. YOUNG remarked that it was often said that some men were born salesmen whilst others were able to develop themselves by study, but in either case it seemed to him that a salesman could learn a great deal by following up the lines suggested by Mr. Atkinson. To a large extent, he imagined, auto-suggestion was very much the same as intuition, that sense by which we were often able to size up an individual and deal with him or her in a particular way. Men who had been through a school of salesmanship were inclined to exaggerate the claims of their goods and that was a dangerous thing to do. It was essential to stick to the truth. Mr. Atkinson, of course, had been speaking of what might be termed pure salesmanship, but what it was necessary to consider also was applied salesmanship in the electrical industry. One of the difficulties of the salesman in the electrical industry to-day was that he had so many little things to sell that he had not time to concentrate on the manner in which he should do his work, on the lines suggested by Mr. Atkinson.

Mr. WATTS (Epsom) mentioned an instance in which auto-suggestion had given him an idea in connection with pre-payment meters. He had to prepare a report on the matter and the thought occurred what was going to happen when the people using the pre-payment meters put in cookers and other apparatus. Later on he was speaking to a lady who had just come back from the Continent and she referred to a slot meter which had a double attachment. The result was that he had been able to find the meter he wanted.

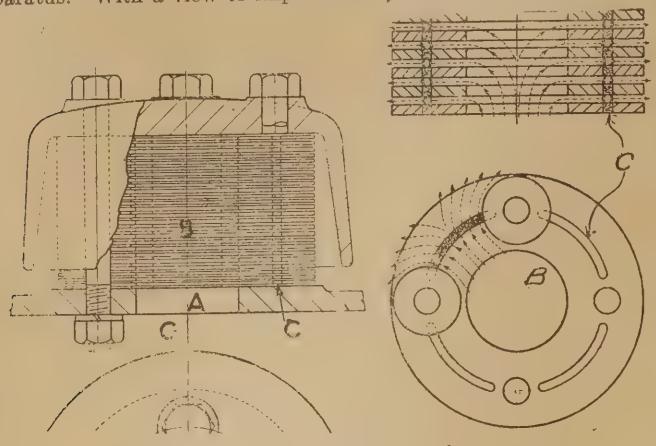
Mr. PAGE suggested that in dealing with auto-suggestion there was a danger of becoming overbalanced and we should endeavour to keep our minds on the right lines with regard to salesmanship in the electrical industry. It was important to keep physically fit and live correctly and so keep a mind capable of thinking clearly at all times.

Mr. A. W. BLAKE (Willesden) said that he was not sure that Mr. Atkinson was on the right lines. He believed that there might be some other equally good reason for getting the same results that had been attributed to the sub-conscious mind. He was inclined to think that auto-suggestion, in a great many cases, came from the source which had been used by successful salesmen for a great many years—taking customers out to lunch.

Mr. L. GASTER said the essence of good salesmanship was to know what one had to sell, and, perhaps what was more important, to know what the "prospect" wanted to buy. It was essential to get the right mentality of the buyer and to show him that he would get what he wanted.

Mr. CHANDLER (Tottenham) emphasised the importance of meditation and concentration on the part of the salesman, as advocated by Mr. Atkinson, because in reading books we were only reading the views of other people. It should be possible for electrical salesmen to carry on their business without trespassing on rival forms of energy.

Mr. R. W. HUGHMAN urged salesmen to be careful not to talk a man into giving an order and then talk him out of it. That was often done, he said, by the salesman's over-elaborating his arguments and making the possible customer think that he knew nothing about it at all. After all, in spite of auto-suggestion, the lowest tender most often got the order.



Mr. ATKINSON, replying to the discussion, said he had not wished to give the impression that salesmanship consisted in the main of suggestion and auto-suggestion. If, as rather appeared to be the case, he had given that view, it was a wrong impression. All he wanted to do was to direct the thoughts of salesmen into a study of suggestion and auto-suggestion as one phase of salesmanship, and he imagined from what had been said, that he had succeeded in doing that. Mr. Blake's remarks were a reminder of times that had passed. The buyers in most concerns to-day who were doing big business were not only men who could not be convinced by that kind of argument, but were the men who resented it. The main point which he wanted to make was that there was an extraordinary force in some part of our mind which moved without our consciously operating it. If he could get that into the minds of those who were present so that it was given consideration with the other factors operating towards good salesmanship then he would have achieved his object.

Electrical Household Activity in America.—The Hurley Machine Co., of Chicago, manufacturers of washing machines, ironing machines, and vacuum cleaners, is to change its name to the Electrical Household Utilities Corporation and increase its capital stock from 300,000 shares of no par value to 600,000 shares having a par value of $10. It will extend its merchandising activities in the electrical household appliance field.

Flame-proof Electrical Mining Gear.

Improved Forms of Plate-type Vents.

The design of flame-proof gear for use in fiery mines involves the use of vents that will allow such plant as motors to be ventilated and also permit the escape of gas or vapour, in the case of oil-immersed switches, &c., without the issue of sparks or products of combustion in such a condition as will enable them to ignite inflammable gas external to the electrical apparatus. With a view to improvement, vents of this class are

Figs. 1 & 2.—E.C.C. Flame-proof Vent.

the subject of constant experiment and two patterns are described below which possess features of interest.

An Oil-switch Vent.

Whilst there is no novelty about the plain rectangular plate type of vent, the design recently described by Mr. F. W. Close in the *Mining Electrical Engineer* is claimed to be more efficient than the usual form. It is of the multi-path class, used by the Electric Construction Co., Ltd., and consists of a pile of annular plates or flat rings, having a large central hole, smaller bolt holes, and some special slots.

The plates are assembled by threading them on steel bolts one above the other, having between them spacing washers, which are also threaded upon the same bolts. On the top of the column thus built a metal cap, of inverted cup shape, completely closes both the centre hole and the slots of the topmost plate, and also protects the plates from damage and dirt. The complete vent may be fixed to the case or cover of any switch, controller, motor, or other apparatus, by drilling the necessary holes in the case to coincide with the holes of the vent plates.

Referring to figs. 1 and 2, the products of combustion under pressure in the spaced marked G will escape through the hole A in the case into the central hole B of the vent. Its mass is then split up and it passes out radially by the many paths between the circular plates for about half the radial distance, when it reaches the slots C referred to previously; here the individual streams of gas have an opportunity of equalising any differ-

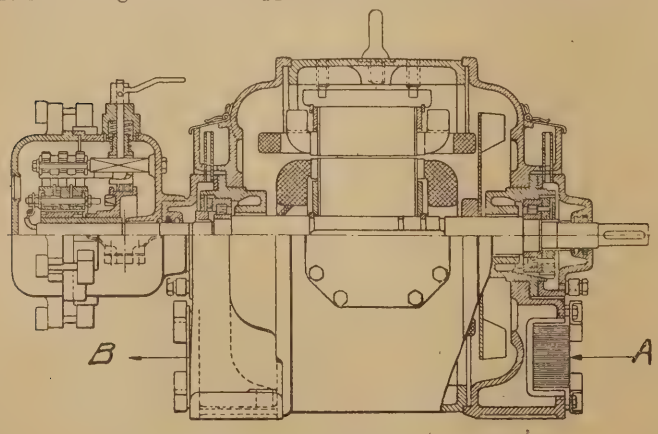


Fig. 3.—Oerlikon Motor with Flame-proof Vents.

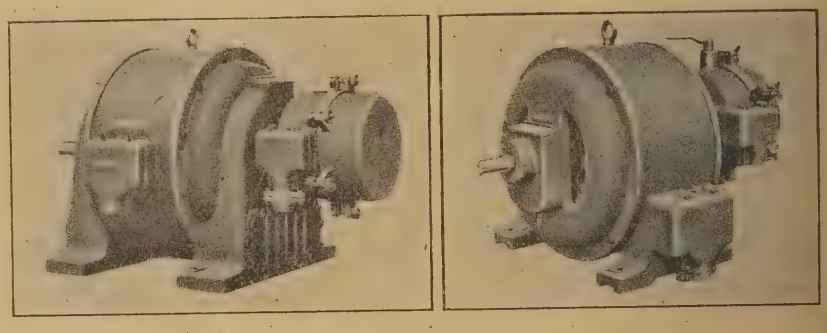
ences in their respective pressures should some of the streams have escaped through some slots with greater force than through others. The gas again divides and passes through the remainder of the paths between the plates to the outside of the vent. The narrow slots C in the plates not only serve the purpose described above, but should it happen that some of the plates become distorted at their outer periphery by mischance, the distortion would probably be arrested at the slot, and the inner portion of the plate would remain symmetrically spaced, and thus the vent would still function with safety.



Another feature in connection with the escape of the hot gas through the slots is the shape of the path between the plates; its cross sectional area increases rapidly during the second half of the radial distance through the plate, due to the circular shape of the spacing washers, and the gas can thereby expand during the last portion of its journey. As one of the physical attributes of gases is a lowering of temperature due to expansion, this action also takes place in addition to the cooling of the gas by conduction while it passes in thin streams between the separate metal plates.

Mr. Close has also experimented with gauze vents, but he found that they are unsatisfactory.

Electric Motors for Fiery Mines.

The Oerlikon Co., of Switzerland, has recently placed on the market a new series of explosion-proof motors that have been tested at the Institut National des Mines, at Frameries, Belgium.

The motors are of the end-shield type; the frame is made of cast iron capable of withstanding the pressure that would be produced in the event of an explosion in the machine. Ventilation openings at both ends of the motor (fig. 3, A and B) are fitted with diaphragms, consisting of brass plates 0.5 mm. thick, inserted to a depth of 50 mm. and disposed one above the other 0.5 mm. apart. The cooling air has thus to pass between the diaphragms, both at the inlet and outlet of the machine. In the event of an explosion in the motor, the hot gases are cooled to such an extent in passing over these diaphragms that they are no longer able to burn when they reach the atmosphere. The machines are fitted with roller bearings in order to avoid risk, which the use of journal bearing is said to involve, of igniting gases in the event of excessive heating; the new series includes single-, two-, and three-phase as well as direct-

Figs. 4 & 5.—Mine Motors with External Slip-rings.

current machines, designed for outputs ranging between 3 and 100-h.p. Slip-ring machines can be supplied with or without brush-lifting and short-circuiting gear; they are provided with totally-enclosed slip-rings, which are outside the bearings (figs. 3, 4 and 5), and can easily be inspected by removing the cover that is bolted to the slip-ring casing by special nuts which can only be loosened by means of a special spanner intended to be retained by a responsible person so that the machine cannot be interfered with without his knowledge.

The control gear of the explosion-proof motors also affords safeguards against the ignition of gas; in the case of three-phase plant it consists of an automatic triple-pole circuit breaker combined with a starter so that the motor can be connected to the system in a simple way. All the working parts are contained in a sheet-steel tank and immersed in oil, also provided with a protective diaphragm vent. The circuit breaker is fitted with one, two, or three overload relays, time lags, and a low-voltage coil immersed in oil. The relays are outside the tank in hermetically-closed casings, and a glass window permits the adjustment of the relays to be checked at any time, but their adjustment can only be altered by loosening a nut.

For outputs below 3 h.p. the use of totally-enclosed machines is suggested as being cheaper than motors fitted with forced ventilation and protective diaphragms.

Latvian Radio Regulations.—The British Consul at Riga has forwarded a translation of regulations governing the trade in radio receiving apparatus and accessories in Latvia, together with a list of such goods the importation of which into Latvia is permitted. The regulations may be seen by persons interested at the Department of Overseas Trade, 35, Old Queen Street, S.W.1.—*Board of Trade Journal.*

The Electrical Contractors' Association.

Annual Dinner.

THERE was a distinguished gathering at the Trocadero, W., on January 19th, on the occasion of the annual dinner of the Electrical Contractors' Association (Inc.), the N.E.C.T.A., and the National Federation Electrical Association. Mr. T. E. ALGER (the president) presided, and he was supported by representatives of all branches of the electrical industry.

After an excellent dinner and the loyal toast, Mr. W. W. Lackie, C.B.E. (one of H.M. Electricity Commissioners) proposed the toast of "The Allied Associations and Honorary Officials." He said that while contractors' schemes required no Government approval, their work was as important as the erection of central stations and the installation of distribution systems. All enlightened supply undertakings would see the wisdom of giving contractors a fair chance, for they were the best canvassers for the industry. It was necessary for contractors to have both technical and commercial ability in order to carry out their work efficiently. Electricity consumption doubled itself in every seven years; that meant a corresponding increase of work for the contractors. Although the cheap supply of energy was said to be but a small proportion of manufacturing costs, manufacturers had told him that cheap power sometimes meant all the difference between profit and loss in their business. The proper way to consider the matter was that the availability of a cheap supply of electricity would attract industries to districts where industries did not exist at present; it would give workmen better living conditions and lead to increased employment. Probably a better measure of the use of electricity than the figure of kWh per head of population was the horse-power per worker. With regard to rural development, in which installation costs would have to be reduced to a minimum, the electrical contractors could be of great assistance. It had to be remembered that these rural districts might eventually become urban, and shoddy wiring would not pay. The Association had done a great deal to improve installation work, and one day all contractors would find it necessary to become members. It was a matter for gratification that throughout the period of industrial depression which had existed practically since the war, the electrical industry had been the one bright spot, and now that there were increasing signs of a trade revival he hoped that electrical contractors would be "up and doing" to secure their share in the coming prosperity which they had done so much to deserve. In conclusion, he said that he hoped that the life line of British industry would be an electric line; contractors could ensure this.

Mr. T. E. ALGER, replying to the toast, said that Mr. Tate's absence through ill-health had been a great disappointment to them all. Referring to the Government's electricity proposals, he said that the scheme would give a great impetus to the electrical industry, and would be welcomed by all sections. There were many problems awaiting a satisfactory solution, and the current year would be a momentous one for the contractor. The latter's business was a highly competitive one; success could only be won by initiative, enterprise and energy. He had not only to train his men but he also canvassed and educated the public, and in this way did a good deal of pioneer work. Prior to the formation of the Association in 1904 several municipal authorities had obtained full trading powers, but from that time up to July last year no full trading powers were given. Then powers were given to three local authorities constituting competitors in a highly favoured position. Lord Donoughmore had suggested a joint committee of suppliers and contractors to discuss the matter. The Association had approached the I.M.E.A. with a view to drawing up a clause satisfactory to both parties, but the I.M.E.A. refused to meet them and the outlook was not satisfactory for contractors. Until recently there were few adequate municipal showrooms; it had been left to the contractors to inculcate the electrical idea. To-day there were the E.D.A., the E.L.M.A., and the municipal showrooms which the contractors welcomed. They only asked for a square deal for the contractor, who had done so much for the industry in the past. A cheap and abundant supply of electricity had been promised. If the costs of supply and service were reduced, the contractor would have a good time. There was need for a national code of wiring regulations. The Home Office had laid down rigid rules for mines and factories, and surely a code was necessary for the institutions and homes of the people. The I.E.E. rules which had been adopted by 96 fire insurance companies were a step in the right direction. With regard to the registration of contractors, Mr. Alger pointed out that 80 per cent. of those registered were members of the E.C.A. He hoped that eventually registration would be made compulsory, as it had been in some foreign countries and dominions. It was desired to put electricity on a good sound basis and to make it an economical proposition that would affect the industry and home of every inhabitant of the country. It was thus imperative that installation contractors should be efficient and capable for its introduction into the institutions and homes of the people, ensuring that that valuable and useful commodity was installed in a manner which guarded against danger. In conclusion, he mentioned that there would be a conference of contractors in Brighton in June next, at which important matters would be discussed.

Mr. WALTER RIGGS, in proposing the toast of the guests, said that many distinguished gentlemen had honoured the Association with their company that evening. He made special reference to the work of Sir Hugo Hirst, who, before the war, had courageously commenced manufacturing carbons at Witton. It was thought that this supply of carbons had played a large part in the winning of the war. Mr. Riggs mentioned that there were with them Sir Benjamin Longbottom, Mr. R. A. Chattock (president of the I.E.E.), Col. R. K. Morcom (chairman of the B.E.A.M.A.), Mr. E. T. Ruthven Murray, Mr. Ll. B. Atkinson (Cable Makers' Association), Mr. A. G. Beaver (E.W.F.), Mr. J. W. Beauchamp (E.D.A.), Messrs. Holmes and McLagan (Accumulator Manufacturers' Association), Messrs. Fletcher and Bush (E.L.M.A.), Mr. A. H. Dykes (Association of Consulting Engineers), Mr. J. N. Stephens (Chairman of the Electrical Accessories Manufacturers' Association), Mr. Leon Gaster (Illuminating Engineering Society), Mr. T. Trimnell (National Register of Electrical Installation Contractors), and Messrs. R. A. Ure and W. Finlay (Electrical Contractors' Association of Scotland).

SIR HUGO HIRST, in responding to the toast, said that Mr. Baldwin's proposals would have the effect of cheapening electricity supply, a matter which he had advocated many years ago. The margin between profit and loss was a very narrow one, and cheap power might make all the difference. Standardisation was very necessary to enable us to compete with foreign manufacturers; the existing diversity was a great handicap to mass production. British manufacturers had the men, machinery, brains and money, and with standardisation they could hold their own. Manufacturers should ask themselves if they were in a position to give adequate supply and service. If they did not organise to meet the demand which was expected, the appalling conditions which had followed the institution of broadcasting would be repeated. He had an idea that there was soon going to be room for an institution of domestic and industrial engineering, which would give an opening to hundreds of men and women trained to the work of instructing the public in the use of electrical appliances. Doctors, accountants, and other professional men had to become qualified, and because of this they were implicitly trusted by the public. It should be the same with electrical service. Such an institution as that which he had mentioned would offer enormous potentialities; it would have professors and lecturers on appliances and wiring systems and service generally. The General Electric Co., Ltd., would willingly give the first £1,000 to such an institution, and he, personally, would endow a scholarship.

Mr. R. A. CHATTOCK, who also replied, expressed the regret of the visitors at the absence of Mr. Tate, whom he said they regarded as the "father" of the Association. The Association had met with antagonism at its inception, but that was disappearing and the supply authorities and contractors were getting closer together and smoothing out difficulties by conference. Birmingham had led the way in this respect. The Corporation had instituted new showrooms which had the whole-hearted support of the Birmingham section of the Association. The registration of contractors was very valuable, and it was unfortunate that so many small contractors were not supporting it as well as they might. He did not think it possible for a municipal authority to enforce a rule that only registered contractors should be employed. In Birmingham, however, all Electricity Department work was now given to registered contractors, and it was hoped eventually to extend this to all Corporation departments. He hoped that many members of the Association would pay a visit to the British Industries Fair, which was shaping very well indeed; he assured them that the large electrical section which had been organised would be well worth seeing.

Col. R. K. MORCOM responded as well. He said that the electrical industry was wonderfully organised; it was an outstanding example of the general tendency of association which had marked this century. Association was the only way in which the competition of highly organised foreign manufacturers could be met. Associations should, however, be careful that they did not overlap or pursue false ideals. There seemed to be little doubt that the electrical industry was in for a great period of prosperity.

Mr. R. ROBSON proposed the toast of the Electrical Trades Benevolent Institution. He said that the industry paid insufficient attention to the fund; while all other sections of industry seemed to be able to raise enormous sums, the amount subscribed to the E.T.B.I. was not commensurate with the importance of the electrical industry. The fund certainly needed more publicity. It could be used as a social link between sections of the industry; for instance, in Newcastle they ran a ball in aid of the fund. This might be done in many other districts.

Mr. J. Y. FLETCHER, in responding to this toast, referred to his appointment as chairman of the E.L.M.A. He said that he would endeavour during his year of office to cement the relations between his Association and the E.C.A. It was a regrettable feature that the E.T.B.I. was not in a position to give regular pensions to those who deserved them, for the work which they had done for the industry. He appealed especially to junior members of the industry, who, if they subscribed in sufficient numbers, would be able to put the Institution on a proper basis.

The health of the chairman was proposed by Mr. R. A. PARSONS and Mr. ALGER briefly replied.

The Physical Society's Exhibition.

Annual Display of Electrical Instruments and Scientific Apparatus.

(*Continued from page 154.*)

Watson & Sons (Electro-Medical), Ltd.

The principal item of interest exhibited on the stand of this firm was the Sunic Potter-Bucky diaphragm, used for eliminating the scattered radiation from X-ray apparatus. Other exhibits included the Hall pattern tungsten arc lamp and a h.p. transformer of the 30-milliampere type. The latter has been designed to suit the requirements of the small cottage hospital and of the private practitioner.

Crompton & Co., Ltd.

On this company's stand there were several new productions. A novel instrument was the "iron ring" ammeter, which consists of a cast-iron case fitted with an iron pack so shaped that it can be clamped round a cable, which thus forms the primary circuit. In this way no wound former is needed and the use of a transformer becomes unnecessary, while all insulation in the instrument can be dispensed with, so reducing liability to faults.

As is shown in fig. 16, A is the pack of iron stampings, in which a circular hole is punched into which the movement fits; at this hole a cut is machined through the ring so as to form a break in the iron circuit, the movement being very similar to an ordinary moving-iron movement. Two wedge-shaped pieces of iron B (bent into the shape of a half cylinder) are mounted upon a spindle, which carries the usual pointer C and arm carrying the damping vane D; the latter swings in a dash-pot E. If now a conductor carrying a current is threaded through the ring, it becomes magnetised in accordance with the strength of the current, and magnetises the moveable pieces of iron. These are then attracted and tend to move so as to bridge the gap in the ring, which tendency is opposed by the spring F and so a scale is marked off. For low currents, owing to the smaller flux, a weak spring becomes necessary,

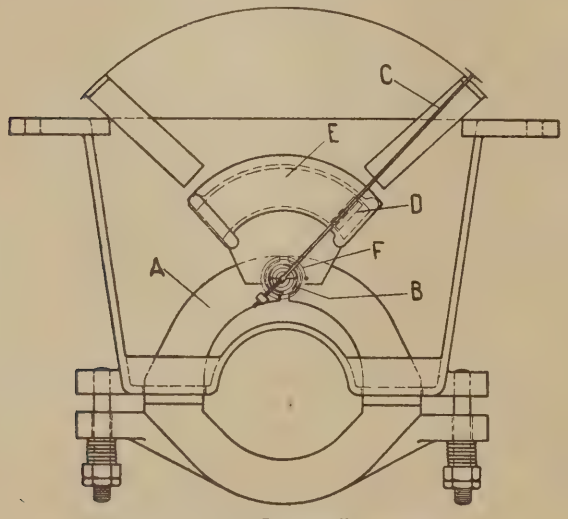


Fig. 16.—The "Iron-ring" Ammeter.

but all that is then required is to thread the conductor through two or more times and thus increase the ampere-turns. The minimum current for satisfactory working with a single conductor depends on the size of the instrument. In the case of the two exhibited, the minimum was 60 amps. for the small one and 100 amps. for the large size. The design lends itself particularly to the horizontal edgewise type of instrument, let in flush on the switchboard, the conductor running vertically at the back, or vertical edgewise when the conductor is running horizontally. In order to be able to remove the instrument without disconnecting the conductor, the ring is cut through and the back part mounted on a separate casting, which is clamped tightly against the remainder of the ring by studs as indicated in fig. 16. This part of the ring can be removed and replaced without affecting the calibration of the instrument. The design is, of course, only suitable for a.c. use, hysteresis making it unsuitable for use in direct-current circuits.

The "Alltest" set shown in fig. 17 should be very useful; it weighs only 12 ozs., and the non-hygrosconic, non-brittle, case is made of moulded insulation material. This multi-range instrument has been developed as a pocket, portable, d.c. testing outfit to be used in conjunction with shunts which are screwed under the instrument terminals, and with bobbin resistances that are screwed (any number in series) to the top or bottom terminal as desired. The attachments are plainly marked for use as separate standards for bridge work and the like, thereby making them specially valuable for research and educational purposes. The action depends on the rotation of a coil in the field of a permanent magnet, being spring controlled and dead beat. An external zero adjusting screw is provided and suitable brackets will convert the ammeter into a swivelling switchboard instrument. Somewhat similar is the "Unique" battery cell-testing voltmeter; the scale is said to be unique, the wide division at the working ranges being obtained by making the pole pieces of an unusual shape. A sample of the com-

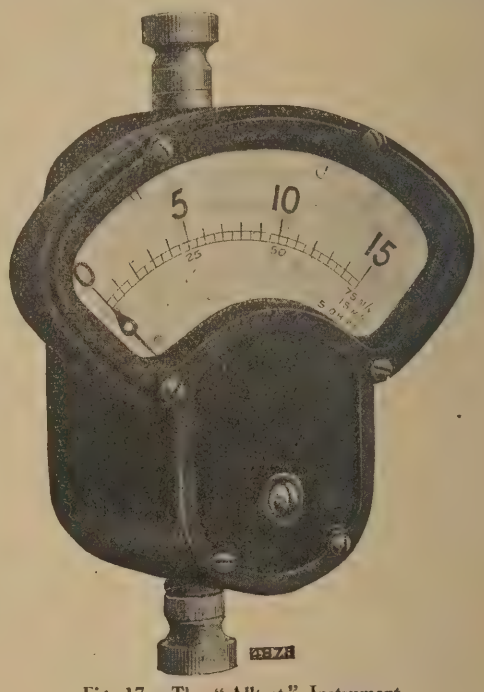

Fig. 17.—The "Alltest" Instrument.

pany's certified flame-proof instruments was exhibited, these having passed the Sheffield University's tests in a creditable manner, while a new hygrometer depends for its action on the variation in weight of a hygroscopic body operating a movement within the case of the indicator, a pointer showing the humidity of the surrounding atmosphere directly on a calibrated scale.

Igranic Electric Co., Ltd.

In addition to a large selection of radio components, the control gear side of the company's activities was represented by a demonstration model of a new design of supersensitive voltage relay. It was adjusted to make or break a circuit so as to magnetically operate circuit breakers with variations of voltage within 1 per cent. of the normal pressure, which was shown by potentiometer variation of the main supply voltage. The special form of iron core used enables such fine limits to be obtained.

The improvement of radio components during the last year is particularly noticeable in the case of the variable condenser. With the old semi-circular vanes, tuning is difficult at the lower end of the wave band, for all the shorter-wave stations are crowded together at the low-capacity end of the dial scale. The "square-law" condenser improves matters somewhat, as it is designed according to the electrical law that the capacity in a given circuit varies as the square of the wave-length to which the circuit is tuned, but the true method of adjusting the positions of stations is by frequency and not wave-length. Therefore, the desirable condenser is one that gives straight-line readings of frequency and not length of wave. The Igranic-pacent condenser is of such a pattern; its plates are similar in shape to vanes of the square-law type and it is claimed to have low-loss characteristics, a true straight-line frequency curve. The fixed and moving plates are of brass, riveted together and soldered, and the channel-shaped framework is rigid and in continuous electrical connection with the moving plates, so reducing hand capacity effects. Only two small pieces of insulating material are used and a substantial dust-proof bearing results in smooth movement. In addition to single-hole fixing, three holes are also provided for those who prefer this method of mounting. These condensers are so designed that two can be mounted together to form a dual condenser with single dial control.

M.O. Valve Co., Ltd.

This exhibit consisted of a selection from an extensive range of thermionic valves for all purposes. Amongst those of the water-cooled anode pattern were double-ended rectifiers and oscillators and single-ended modulators and oscillators. The extra-high-pressure rectifiers have molybdenum anodes almost totally enclosing the filament system, and are capable of with-

standing a maximum reverse peak of 150,000 volts; the maximum rectified current is of the order of 100 milliamps, r.m.s. Apparatus was also shown for illustrating a rapid method of measuring the amplification factor of valves.

Elliott Bros. (London), Ltd.

On the stand of this firm was shown an extensive range of miniature switchboard and portable instruments, including ammeters, milliammeters, voltmeters and testing sets for wireless, automobiles, aircraft, &c. The voltmeters, with the use of multipliers, will cover a wide range of from 15 to 600 V. A multiversal test set shown by this firm was originally designed for the mains engineer, but has been developed until it forms a universal testing set. It consists of a sensitive D'Arsonval galvanometer with shunts for varying the sensibility, together with a number of coils of from 0 to 110 ohms resistance, coupled in conjunction with two ratio arms to form a Wheatstone bridge, each arm consisting of four coils, 1,000, 100, 10 and 1 ohms. An additional external dial can be provided to extend the range of measurement. By means of a universal shunt, five sensibilities are given to the galvanometer. The whole is mounted on ebonite in a varnished teak case; a 3-ft. tripod is also provided. Other exhibits included a cylinder-pressure indicator; a Rayworth's differential cell-testing voltmeter; an averaging recorder for bulk power supplies, an instrument giving the total consumption and also the maximum demand averaged over a definite time interval. It can be calibrated as a kVA meter if so desired. A direct-reading potentiometer, a G.P.O. detector No. 2, a portable Wheatstone bridge with a self-contained galvanometer and a new pattern D'Arsonval galvanometer, were among the other exhibits. The latter instrument is of the highly-sensitive type and gives a 1-millimetre deflection at a scale distance of 1 metre with 5×10^{-10} A., with a periodic time of 10 seconds. A multiversal current transformer was also an interesting item on the stand. This apparatus is designed to give a large number of ranges with precision accuracy. The Ashdown rotoscope, manufactured for the Autocar Auxiliaries, Ltd., Letchworth, an instrument constructed on the stroboscope principle for the observation of mechanical motion, was also shown.

Foster Instrument Co.

This company displayed several interesting pieces of apparatus, including pyrometric instruments and those for purely electrical measurements. One of the most attractive exhibits was a new dial recorder, which is particularly adapted for records of temperature. The instrument operates by producing a chain of dots by means of a carbon-paper sheet under-

Fig. 18.—Indicator with Broken-Couple Alarm.

neath a translucent circular chart. A convenience resulting from this construction is that the whole of the mechanism is behind the chart and enclosed and protected in the case. The case is of convenient circular form and allows the whole record for 24 hours to be inspected without disturbing the instrument. It is entirely dust-proof and fully magnetically shielded. The moving system of this recorder has a patented spring mounting, developed by Mr. C. E. Foster and known as the "Resilia" system, by which it is claimed to be able to withstand the vibration consequent from the method of making the record by a succession of dots, which has, of course, the advantage of avoiding any frictional errors.

Another exhibit was a pyrometer indicator, fig. 18, fitted with an automatic signalling arrangement. By means of this signal lamps are lighted showing, by a white light, when the temperature is at the required figure; a red light indicates the temperature being too high and a green light corresponds to a temperature below the required figure. A valuable improvement to this instrument, a broken-couple alarm, was shown working. When the thermo-couple breaks the indicator is short-circuited across an accumulator and the pointer is carried beyond the maximum temperature reading on the scale.

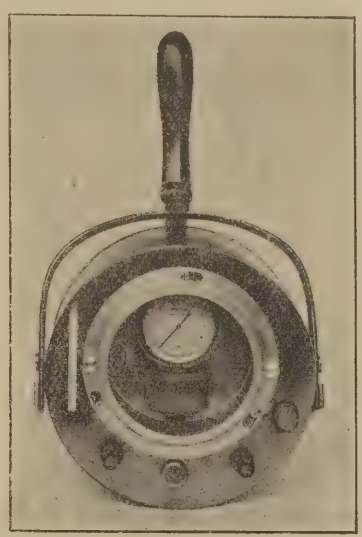

Fig 19.—Portable Surface Calorimeter.

When this happens a special alarm signal is given, calling attention to the failure of the thermo-couple so that it may be replaced before damage is done.

Another piece of apparatus of interest seen on this stand was a portable surface calorimeter, fig. 19. This instrument comprises a closed chamber having one surface blackened for presentation to or contact with the hot surface, whose heat loss is to be measured. Connected with this chamber is a small capillary tube constituting a leak, and also connected to the same chamber is a sensitive pressure gauge. When the blackened surface receives heat, as for instance from the pipe lagging, the air in the chamber expands and escapes through the leak, but in doing so a pressure is set up which is shown upon the gauge. Very quickly a steady condition is attained when the expansion of air due to the reception of heat, balances the loss of air through the leak with a corresponding steady reading on the pressure gauge, giving a measure of the heat loss.

Automatic and Electric Furnaces, Ltd.

An improved Wild-Barfield automatic steel-hardening equipment exhibited by this firm, embodies a new method of working. The heating of the furnace is effected by d.c., but the magnetic detector is operated by converted energy obtained from a commutator run by a 1/16-h.p. motor. The d.c. completely saturates the charge when approaching the critical change and the furnace is rendered non-inductive by an opposing winding. Two windings forming a quadrature transformer are arranged on the furnace casing and a second quadrature transformer having precisely the same inductance is erected on a switchboard. The two primary windings of these transformers are connected in series and are fed with a.c. The two secondary windings are connected in opposition so that the two corresponding pressures cancel out when no charge is in the furnace. As soon as a charge is introduced into the furnace an out-of-balance alternating e.m.f. is received. This is rectified by means of a second commutator on the motor and is measured by an ordinary d.c. moving-coil millivoltmeter.

It is claimed that while with the a.c. method the flux density in the steel generally shows a gradual decline during the process of heating, with the lower magnetising force found possible with d.c. the flux density in the steel shows a decided increase before it finally declines.

The Record Electrical Co., Ltd.

A change-coil volt-ampere test set was a feature of the display on this stand. It contains two moving-iron movements arranged at each end of the case. Each range has a separate scale marked on a drum, which rotates by depressing two knobs at the end of the drum, therefore overcoming the disadvantages of having many scales on the one dial. The set is complete in itself, all the coils being housed in a receptacle in the case. Other instruments showed include a complete range of "Cirscale" instruments, with a pointer deflection through an arc of approximately 300 deg.; a variety of portable measuring instruments, circuit breakers, &c.

(To be continued.)

Selected Radio-Telephone Apparatus.

Recent Developments and Improvements.

A Good Crystal Detector.

One of the best crystal detectors we have seen is that illustrated in fig. 1, a product of Messrs. McLeod & McLeod. It is designed on the right lines, made with precision, and the sample sent us functioned admirably. Both the crystal and cat's-whisker (the latter is much more substantial than usual) are instantly get-at-able for adjustment without the use of threads; a slight rocking movement will remove both the end

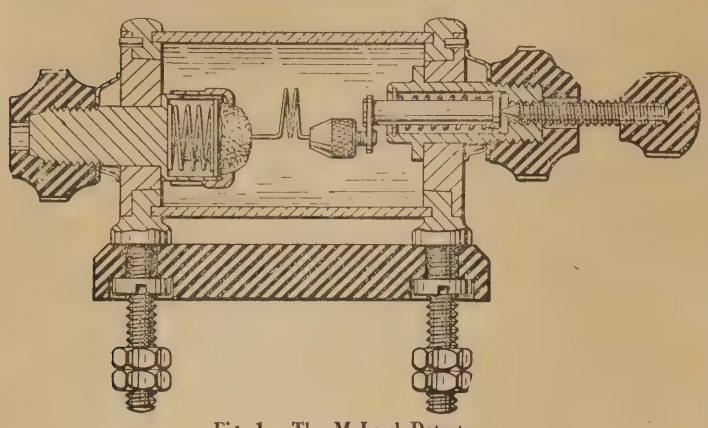

Fig. 1.—The McLeod Detector.

sections without the glass dust cover and end rings falling apart, while both sections are interchangeable, giving the advantage of right- or left-hand control, and the length of the spring plunger type of crystal cup can be adjusted. The rotary movement of the crystal and the lateral movement of the whisker are given by turning the large ebonite knobs, the projection of the whisker being made by turning the small knob. The whole face of the crystal can be explored and connection is made by the nuts below the ebonite base of the detector. All metal parts are nickelled and a chuck facilitates the whisker renewal.

Some Ediswan Components.

Should a grid leak not retain a steady resistance, it will cause crackling and parasitic noises due to the irregular discharge. Moreover, the resistance depends upon the applied voltage; thus, if the voltage is tripled, the resistance may drop to about half its orginal value. Amongst recent products of the EDISON SWAN ELECTRIC CO., LTD., is a low-capacity leak which is free from the above-mentioned defects. The resistance element is enclosed in a frosted glass tube which is evacuated, and when handling it a clean rag should be used to avoid moisture or foreign matter being left on the tube, which may establish a path along the surface of the glass between the metal end-caps. The leak is made in 0.5, 1.0, 2.0, 3.0, and 6.0 megohm sizes.

The double-value low-loss variable condenser shown in fig. 2 is actually two separate condensers united with a small knob operating either separately or jointly the two condensers in parallel. When tuning on wave-lengths below 500 metres with a large condenser stations are grouped very closely together on account of the extremely small movement required. The instrument illustrated in fig. 2 overcomes this drawback as it is possible to have only one of the condensers (300 micro-microfarads) operating in the circuit. When it is required to tune longer wave-lengths, say 1,600 metres, it is necessary to use a larger condenser, which is made possible by screwing in the small knob as far as it will go, when the condenser changes its value from 300 to 800 micro-microfarads. Both end plates are stampings of aluminium, skeletonised to minimise dielectric losses, and the vanes are of tinned hard brass.

The dual rheostat shown in fig. 3 has unusual means of changing over from high to low resistance. The wire is wound on a strip of fibre mounted in the form of a ring round the edge of the disk of insulating material with a central contact through the rotating arm with the wire on the edge of the fibre strip, a stop in the centre preventing the contact arm from accidentally slipping over on to the alternative resistance wire. When it is desired to change from high to low resistance, or *vice versa*, the central knob is pushed in, thus enabling the contact arm to clear the stop already mentioned; the control will then resume its normal course through a strong spring causing it to again make contact with the resistance wire.

The Ediswan intermediate coupler for super-heterodyne circuits has been designed to enable amateurs who wish to construct their own heterodyne receivers to employ a dependable unit. It contains the coupling transformers and a filter circuit suitably spaced and mounted on a common spindle, all connections being made to terminals on the two longest edges of the base. The whole of the parts are mounted on ebonite strips, the latter being engraved to indicate the different positions of the terminals in the circuit. The component takes its place in the super-heterodyne set between the first and second detector valves. The instrument needs no tuning and any tendency to self oscillation is overcome by the adjustment of the potentiometer used in the circuit.

New G.E.C. Components.

To its wide range of accessories the General Electric Co., Ltd., has recently added a universal filament rheostat that embodies features of an advantageous character. As shown in fig. 4, it is suitable for controlling either bright or dull-emitter valves; it consists of two coils of wire connected in series; one coil has a total resistance of 5 ohms, and the finer-wire coil a total of 25 ohms. The body of the rheostat is of brass and the wire is insulated from the casing by heat-resisting composition. The circular black dial, engraved white, is calibrated in ohms, and between the high- and low-resistance windings there is a "stop" position which acts as a safeguard against the over-running of dull-emitter valves; the tension on the contact arm is adjustable. Another addition to its components consists of two types of low-frequency transformers, which are available with ratios of 2-1 and 4-1. The former type is specially recommended for use in a circuit in which the detector valve has a relatively high impedance, while the 4-1 ratio type will give volume and clarity of tone when used in conjunction with a valve of low impedance or in the first stage of low-frequency amplification after crystal detection. Both types of transformers have real character, and the uniform standard of their performance is not the least of their commendable features.

In both patterns the primary winding is of high inductance, and the coils and trampings are hermetically sealed in the case with a special compound so as to be impervious to moisture. The drawn-metal case is of crystalline finish, as shown in fig. 5, and it acts as a shroud to prevent magnetic interaction when two transformers are mounted close together.

Fig. 5.—"Gecophone" Low-frequenc Transformer.

"Sarbolt" Aerial Insulators.

Of British manufacture, the aerial insulator shown in fig. 6 is designed on telegraph insulator lines. It is made of vitreous porcelain throughout and does not depend on its glaze for insulation; it is provided with a ½-in. internal Cordeaux thread, a galvanised wrought-iron stem and a swivel hook. A felt washer rests on the stem shoulder to keep the screw

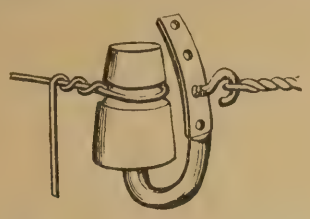

Fig. 6.—The "Sarbolt" Insulator.

free from moisture and rust and allow for expansion and contraction. It is claimed by the Hatton Supply Co. that the weight of that portion of the stem and insulator which falls below the level of the aerial wire, acting in conjunction with the free movement of the swivel hook, as indicated in fig. 6, keeps the insulator vertical in all conditions. The position of the hook can be changed to whichever hole suits best, in accordance with the slant of the aerial.

Chinese Conditions in 1925.

A Difficult Period for British Traders.

MR. H. J. BRETT, Commercial Secretary at Shanghai, has forwarded a report to the Department of Overseas Trade on the commercial, industrial and economic situation in China to June, 1925.* The report was written at the time of the general strike at Shanghai, which was paralysing foreign trade and some of the most important industries. This circumstance, combined with the continuance of civil war in China, has rendered the economic situation and the prospects for foreign trade in China in the immediate future, anything but bright. It is remarkable, however, that in spite of these disorders, the import trade of the country has continued to grow, albeit on very unsatisfactory terms, many foreign firms having sustained heavy losses. The development of new industries, although checked by the lack of security and confidence, is likewise proceeding slowly but surely, and the whole economic life of the country is gradually changing. While, therefore, business conditions are likely to grow worse rather than better for some time, there seems to be no reason to doubt that China must still remain one of the greatest potential markets in the world.

Foreign Trade.

As stated above, the import trade of China continues to increase, but the 12 months under review proved a difficult and discouraging period for all engaged in the machinery trade. The depression in this branch has affected importers of all nationalities, but British firms have also had to contend with the keen competition of low-priced Continental machinery and the readiness of their rivals to accept orders on terms which a British house could not regard as sound business. Mr. Brett says that it is nowadays practically impossible to secure any important engineering or machinery contract in China except upon terms of extended credit, and it is extremely difficult in most cases to obtain substantial guarantees of payment at stipulated dates. This is particularly true in the case of electric light works, mills, or other industrial undertakings, especially in the interior of the country. The Customs returns do not indicate the total imports into China of electrical machinery, although there is one item covering electrical material and fittings. Under this heading imports in 1924 were valued at 8,194,962 Haikwan taels (tael = 3s. 8d. approx.), being on about the same level as in 1923 (8,103,340 taels). The bulk of the electrical machinery imported into China is for lighting purposes, and as evidence of the extent to which the use of electricity in China has developed, in spite of unfavourable conditions, it may be mentioned that a list of electric light plants published last year by the Government Bureau of Economic Information contained the names of more than 220 such undertakings, with an estimated plant capacity exceeding 400,000 kW. Apart from the contract for a 4,800-kW installation in Tientsin secured by a German firm on very extended terms of credit (over 8 years) few important orders for electrical equipment were placed during 1924, and business was far from active. From the point of view of British manufacturers the year was particularly difficult owing to the practical impossibility of meeting Continental competition. It is stated that in the case, for example, of 40-kW installations, for which a fair demand exists, the difference between British and Continental prices amounted in some instances to as much as 90 per cent., and the superiority of the British plant was thus rendered a comparatively unimportant factor. In the case of electrical supplies and fittings, competition comes not only from the Continent and Japan, but also from local products which are being placed on the market in large quantities at about half the price of similar British articles.

* Stationery Office, 2s. net.

British Trade with China.

The report states that it is hardly possible to look optimistically upon the future prospects, for, apart from the general paralysis of trade and shipping caused by the strike, it must be practically certain that a determined effort will be made to direct a special boycott against British firms and goods, and though the effects of such a movement will probably be merely transitory, so long as it continues it will impose a further strain on the already over-burdened British merchant in China. Competition with other manufacturing countries grows steadily keener, and, as stated above, price is the ruling factor and the high quality of British goods is not in itself sufficient to counteract the advantage of lower production costs existing in Europe and Japan. In spite of these discouraging features, however, the future in store for British trade in China is not altogether unpromising. The anti-British campaign will have but a passing effect on the business policy of the Chinese merchant, and when this phase is over the high reputation of British goods will still retain its force, and our share in China's trade will depend mainly upon the readiness of manufacturers and merchants to adapt themselves to the altered conditions in the country. British manufacturers should therefore continue to devote the closest possible study to the requirements of the Chinese market. It is recommended that in the first instance, information regarding trade conditions in China should be sought from the Department of Overseas Trade and the fullest possible information should be provided as to prices, discounts, agency terms, &c. The manufacturer should be prepared to give all possible assistance to his local representative, especially when the goods concerned are being placed on the market for the first time. It is considered desirable to repeat the warning, frequently given in previous reports, against entering into transactions with unknown Chinese firms where any question of credit is involved. Information as to the standing of any firm of importance in China, whether native or foreign, can frequently be obtained through the London offices of the Far Eastern Banks, or in case of necessity, an inquiry through the Department of Overseas Trade may secure the required particulars. Finally, it may be said that by far the best plan for those contemplating trade with China is for them to make a thorough investigation on the spot through a competent representative. It is satisfactory to note that during recent years the tendency on the part of leading manufacturers in the United Kingdom to adopt this course has been steadily increasing.

Imports Into Dairen.

In an annexe to Mr. Brett's report, Mr. O. White, British Consul at Dairen, reports upon the trade of that territory. In the course of this it is stated that the purchases of the South Manchurian Railway Co. during 1924 were smaller than in the preceding year. The amount of electrical material bought amounted to 2,661,000 yen, of which only 29,000 yen represented British goods. As regards electrical imports generally, the value rose from £304,309 in 1923 to £412,000 in 1924, the principal item being cables and wires, £135,500.

New High-power Testing Laboratory.—During the past year the Westinghouse Electric and Manufacturing Co., of East Pittsburgh, U.S.A., has placed in service a new laboratory that is to be used primarily for testing the interrupting capacity of oil circuit-breakers, contacts, and fuses, and the thermal capacity and mechanical strength of current-carrying parts in power houses. The power equipment of the laboratory consists of two 20,000-kVA, 600-r.p.m., synchronous generators connected in parallel and driven by a 3,300-h.p., 60-cycle motor. The generators are arranged with a number of parallel circuits so that varied current and voltage are obtainable. Provision is also made for applying 25 cycles to the motor with resulting 25 cycles at the generator terminals. Due to the large amount of power thus made available, it will be possible to make exhaustive tests; on short circuit the generators will deliver a maximum current equivalent to 700,000 kVA, 3 phase, and when testing a complete single pole of a circuit-breaker on single phase, an initial current can be produced equivalent to more than one million kVA on a 3-phase system. A group of current-limiting reactors is provided and so arranged with disconnecting switches that current obtained on short circuit may be limited to practically any value, thus making the entire power of the plant available for sustaining the voltage. Very complete measuring equipment is provided, including 3-element and 5-element oscillographs, for securing complete test information. Provision is made for the automatic operation of the tests under oscillograph control to assure proper timing of all operations. Dark-room facilities are also provided to permit the immediate development of oscillograph films.

"The Romance of Copper."—Such was the title of the address recently delivered by Mr. Ll. B. Atkinson at the Demonstration Halls of the Metropolitan Borough of Hackney Electricity Department. Mr. L. L. Robinson, borough electrical engineer, opened the meeting by introducing Col. T. F. Purves, chief engineer of the G.P.O. The lecture, which was illustrated with lantern slides, after contrasting solar and atomic dimensions, explained "the passage of electricity" in terms of the movement of electrons, and concluded with a reference to the various types of electric cable, their construction and insulation.

The Testing of Static Transformers.

The Importance of Accuracy and Some Methods of Obtaining It.

By J. LINDLEY THOMPSON, M.Sc., M.I.E.E., and H. WALMSLEY.

(*Abstract of paper read before the* INSTITUTION OF ELECTRICAL ENGINEERS.)

THE paper describes the usual methods adopted in the commercial testing of static transformers. Emphasis is laid on the need for accuracy, and methods are suggested whereby it can be obtained. Accurate results create confidence in the mind of the customer, and also give the designer and manufacturer confidence in their product. Testing serves as a check on workmanship, materials, design and drafting, and should function as the most critical inspection of the product.

Drying and Insulation Resistance.—The drying of transformers is, in reality, a test of insulation resistance; not the actual value obtained from any Megger reading, but the characteristic with time and constant temperature. Of the ways of drying transformers, the most satisfactory is by the circulation of dry, heated, air and by the vacuum process. Drying by air should be confined, from the point of view both of efficient drying and of the necessary time taken to ensure dryness, to transformers wound for voltages not higher than

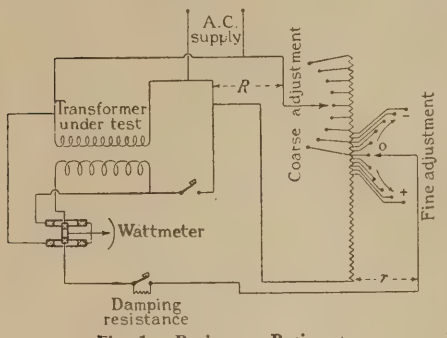

Fig. 1.—Resistance Ratiometer Arrangement.

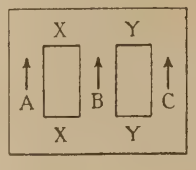

Fig. 2.—Flux Diagram; Core-type Frame.

11,000. The temperature necessary in a drying chamber is about 80 deg. C., and the time required varies with the size and construction of the unit, *i.e.*, it depends on the quantity of insulation embodied therein. The length of time can be gauged from the dielectric, characteristic, as shown by the curve of Megger readings taken during the process. In the case of transformers, especially those of high-voltage, which have a high electrostatic capacity and so require an appreciable charging current, the Megger voltage should be applied for at least 60 seconds. A high-voltage Megger is essential, *i.e.*, one wound for 1,000 or 2,000 volts. As a guide, when a transformer is dry the following empirical formula, in which f is the frequency, will be useful:—

$$\text{Megohms at approx. 75 deg. C.} = \sqrt{\frac{\text{Kilovolts} \times 20}{\frac{(\text{Kilovolt-amperes})}{f}}}$$

In general, a transformer may be said to be dry if the insulation resistance is at a high, or infinite, value when the transformer is heated to a temperature of 80 to 85 deg. C. For transformers for higher service voltages than 11,000 the vacuum process of drying is recommended as being the surest and quickest.

The container is heated to the required temperature at atmospheric pressure, and allowed to remain in this condition until the transformer becomes uniformly heated and the insulation resistance has reached a low constant value. A vacuum of approximately 28 in. accelerates the drying by rapidly liberating the moisture, which is drawn off by a pump. If oil impregnation is required it is done at this stage, dry, clean, oil at a temperature approximately that of the transformer being allowed to enter under vacuum until the transformer is fully immersed. The plant is then allowed to stand in this condition until such time as full penetration of the insulation is complete. If oil impregnation is not required, the vacuum must be released slowly through an air drier, to prevent moisture entering with the air.

Ratio Testing.—The voltmeter method leaves much to be desired. The standard-transformer method, until the last year or two, was the standard employed by most manufacturers. High-voltage transformers take an appreciable charging current, and hence, as this method is a null one, errors within limits are quite possible. Resistance-balance ratiometers are now generally employed and give reliable results in all cases. Fig. 1 shows the h.p. winding of the transformer connected across a resistance R, tapped to suitable dial switches arranged to give various resistance values. The l.p. winding is connected in opposition across a part of this resistance R, also tapped through suitable dial switches to a sensitive wattmeter to show the balance of the two circuits, the field coils of which are excited off the h.p. supply. By this arrangement any current flowing in the l.p. windings will be indicated by a wattmeter reading. The procedure is so to adjust the dial switches as to obtain a true balance and a zero reading on the meter. The ratio of the transformer is then R/r. In general, this type of ratiometer has superseded the other methods mentioned.

Polarity Testing.—This is the only means of accurately determining the connection of transformers for parallel operation, or connection in banks. Apart from a visual examination of the rotation of the windings, polarity can be readily obtained by comparison with a transformer of known polarity, and can be carried out at the same time as the ratio test if the standard-ratio transformer be suitably marked. Another method is that of employing a single-phase wattmeter, the direction of rotation of the eddy-current disk indicating the polarity. Still another method is that of using direct current.

Iron Loss and Magnetising Current.—This loss is in most cases constant and, therefore, important to the customer from the point of view of running costs; by supplying the normal voltage at the correct frequency to one winding of the transformer, with the other open circuited and the voltage and frequency adjusted to the correct values for the particular winding, a wattmeter reading will then give the iron loss and the ammeter reading the no-load current, often mistakenly termed the "magnetising current." With small transformers there is an appreciable difference. The no-load power factor varies according to the size and frequency of the transformer under test, and comes within the range of 0.2 to 0.06 approximately. This necessarily results in small readings on the wattmeter, and therefore possible errors in reading. To overcome these inaccuracies of reading it is essential that a wattmeter be used suitably designed for low-power-factor work. Such meters are available and the authors have had them in constant use for some considerable time with satisfactory results. One has its maximum capacity in volt-amperes equal to five times the maximum scale reading in watts, which means that, compared with an ordinary wattmeter for unity power factor, the error in scale readings is only one-fifth. For three-phase iron-loss measurements several instruments are necessary, unless some special change-over device is used for putting the same instruments in the different phases in turn. Two- and three-wattmeter methods give accurate results, provided suitable instruments are used.

Easy and accurate measurement of frequency is of vital importance in transformer testing, for more than 25 per cent. of inaccurate results can be traced to insufficient care in obtaining a true reading. The method recommended is a series of frequency meters of the electro-magnetic type, connected to slip-rings off the armature of the d.c. driving motor. Several advantages can be claimed for this method: By using a relay, the instrument can be easily connected to any measuring table;

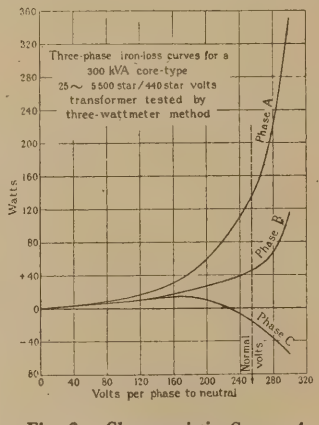

Fig. 3.—Characteristic Curve of Losses.

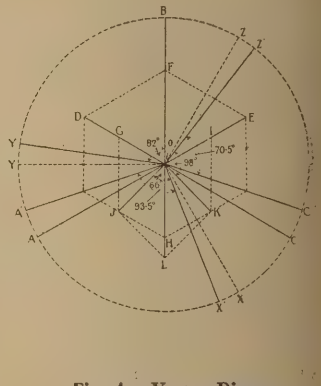

Fig. 4.—Vector Diagram.

the instruments can be used for several machines, and the range of frequencies measured can be limited, a wide scale being provided for a small variation in frequency.

Three-phase Core-type Transformers.—When measuring the iron loss of three-phase core-type transformers by the three-wattmeter method the losses measured in the three phases are never equal, and in some instances a negative reading is obtained in one of the outer phases. This apparent anomaly is puzzling to many, but it can be accounted for by the unbalancing of the magnetic flux in the core, due to its shape. If, in fig. 2, by applying a symmetrical three-phase voltage to the three phases, we excite each limb to the same flux density, half the flux in limb B returns through limb A, and half through limb C, because from the point of view of phase B the core is symmetrical. The flux in limb A returns part by limb B and part by limb C, but due to the fact that the reluctance of the return path through B is lower than that through C more flux will pass through B than through C. Similarly the flux in C will return in like manner through B and A. Supposing the reluctances of these paths are in the ratio of 60 to 40, then 60 per cent. of the flux from A will return through B and

40 per cent. through C and similarly 60 per cent. of the flux from C will return through B and 40 per cent. through A. The reason for the unequal loss measurements is the unequal distribution of the return flux.

Fig. 3 is a characteristic curve of loss measurements in each phase, plotted against the applied voltage. The extent of the negative value depends on the induction in the core at normal voltage, and also on the relation of the reluctances of the two magnetic paths for the flux in limbs A and C. This negative reading also means that the phase angle between the no-load current and voltage in phase C must be greater than 90 deg. Fig. 4 shows this relation graphically, drawn from test figures, with certain assumptions. The no-load currents have been taken as a measure of the reluctance, though this is not strictly true owing to their watt components.

Iron Loss and Form Factor.—The iron loss may be directly measured by the method already described, but unless the wave-form of the applied voltage be a sine wave the results will be greater or less than the estimated or correct loss. In general the wave-form will be peaked, due to the nature of the load on the machine, and the measured losses will be of a low order. Since the form factor of the wave does not affect the eddy loss in the same manner as the hysteresis loss it is necessary, if a correction is to be made, to separate the loss into its two components and correct the hysteresis loss in line with the form factor. Table I shows the effect of form factor on hysteresis loss :—

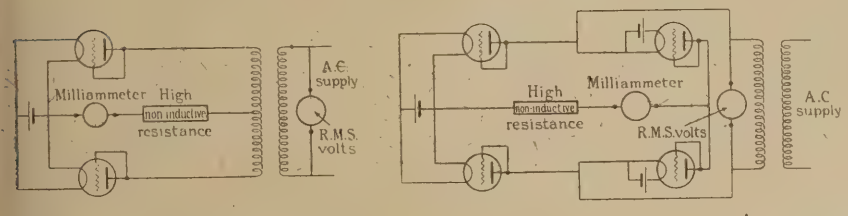
TABLE I.

Form factor.	Relative hysteresis loss. Per cent.
1.0	118
1.05	119
1.11	100
1.15	94.5
1.2	88.2
1.3	77.6
1.4	69.3

Hysteresis loss forms by far the greater proportion of the total loss, so that any increase in form factor will appreciably reduce the measured loss and so give erroneous results. The correction for form factor may be accomplished by (1) obtaining the form factor of the applied voltage and correcting the hysteresis loss in line with the form factor, and (2) applying an equivalent voltage to compensate for the form factor by means of an iron-loss voltmeter.

To correct by method (1), it is essential to obtain the correct wave-form of the applied voltage, or its form factor. This can be done by means of the oscillograph, thus obtaining a true picture of the wave and then analysing it for the form factor. The form factor can also be obtained by fixing a commutator to the machine giving the a.c. supply, which method is not recommended, or by the authors' arrangement of rectification of the complete a.c. voltage wave by means of either two or four three-electrode thermionic valves, as shown in figs. 5 and 6.

To obtain satisfactory results, a straight-line characteristic had to be aimed at for valve impedance plotted against circuit voltage. By maintaining the filaments at a constant normal temperature and the external resistance at a high value relative to the internal resistance of the valves, the working part of the characteristic was approximately a straight line. The most suitable valves are of low impedance, and to reduce this still further their grids were connected to the plates. Using an external resistance of 104,310 ohms, as the voltage across the valve outers was increased, the valve impedance decreased rapidly and became constant or asymptotical at 160 volts, or approximately 5.6 volts (d.c.) across the valves. With four-valve rectification, two valves were used in series for each half-wave rectification, and their impedance became constant at 4,000 ohms. With two-valve full-wave rectification the mid-point of the transformer was used as the bridge point, and the results obtained were more accurate than those obtained by the four-valve method. The former is therefore recommended as the most suitable. The authors claim the tests to be accurate within 0.5 per cent. by the method described.



Separation of Losses.—In addition to obtaining the form factor, the losses measured must be separated into the two components (hysteresis and eddy loss) because, since the form factor affects only the hysteresis loss, that component must be obtained : (*a*) Measure the loss at constant induction and varying frequency and plot loss/frequency against frequency; this should be a straight line, and the ratio of the ordinate at the vertical axis to the ordinate at normal frequency gives the ratio of hysteresis loss to total measured loss : (*b*) Measure the loss at constant voltage and varying frequency and plot it against $1/f^{0.6}$; this should be a straight line, and the point where it cuts the vertical axis gives the eddy-current loss in watts. Method (*a*) is the simpler and quicker, which is a great asset to test-bed work. Having obtained the hysteresis component and the form factor, the hysteresis loss should be multiplied by :—

$$\frac{(\text{Form factor})^{1.6}}{(1.11)^{1.6}}$$

Results obtained by the above loss-separation methods, from a commercial-test point of view, show little variation. The method of correction for wave-form by applying a compensated voltage value in line with the form factor, is simple and easy in operation, but depends entirely on the calibration of an iron-loss voltmeter (used by the American Westinghouse Co. and the General Electric Co., of America), which indicates an equivalent voltage for a sine wave-form of applied voltage. The similarity, or almost equality, in the results obtained by the two methods is worthy of attention.

Copper or Load Loss and Impedance Tests.—The measurement of copper loss is usually carried out by an arrangement of instruments similar to that used for iron-loss measurements, except that one winding of the transformer (usually the l.p. winding) is short-circuited, and a supply capable of circulating the full-load current at the correct frequency is connected to the other winding. The ratio of the ohmic loss to the eddy loss varies for different transformers. The separation of the losses can be carried out by (*a*) calculating the ohmic loss from the measured resistances of the transformer windings and subtracting this loss from the measured loss, which gives as a result the eddy-current or stray losses, and (*b*) by separation of the losses, and by taking several readings of watts lost and frequency, keeping the load constant; the watts loss plotted against the square of the frequency is a straight line, and the loss at zero frequency is the true ohmic loss.

When taking copper-loss measurements on three-phase transformers it is advisable to apply three-phase currents, especially for transformers having a high internal reactance, as the eddy currents tend to become unbalanced and excessive when measured single-phase. Single-phase measurements with all three phases connected in series, either in open delta or Z connection, are liable to excessive errors and should not be used except for three single-phase transformers to make up a three-phase group. With transformers having magnetic shunts between the h.p. and l.p. windings to increase the reactance, it is necessary that a curve of impedance should be taken up to a high value of overload to prove that the shunt does not become saturated within the loading limits and that the impedance at the higher values does not deviate from the straight line beyond the permitted tolerance. The copper loss of a transformer is usually guaranteed at a specific temperature, but it is rarely possible to obtain the actual reference temperature on test, so that corrections have to be made to arrive at the copper loss for comparison with the guarantee. The losses in the magnetic shunts due to the leakage flux which they carry are inseparable from the total parasitic losses by any known test methods. In corrections they are assumed to vary as the eddy-current loss for copper. Any error due to this assumption is small owing to the low value of these losses, which can be approximately calculated.

Figs. 5 & 6.—Two- and four-valve Full-wave Rectification.

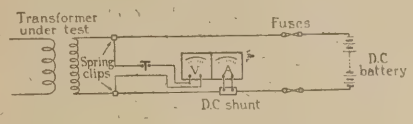


Fig. 7.—D.C. Resistance Measurement Diagram.

Resistance.—For cold measurements the direct methods are not recommended, for they are generally influenced by thermal and capacity effects. The method recommended is the indirect one, using an ammeter, voltmeter and a d.c. battery as shown in fig. 7. A precision meter should be used, preferably of the combined type, with various ranges of shunts and resistances for the instrument; the whole apparatus should be set aside for resistance measurements only and it is very necessary to take care that all electrical circuits linked up by the same magnetic circuits are open-circuited before any readings are taken.

Full-load Temperature.—The load-runs for single-phase transformers can be divided into unearthed and earthed windings. The former are most common and are connected back to back, or virtually in parallel. The core losses are supplied by exciting the two transformers in parallel, and the copper or load losses by injecting in the parallel link of either the h.p. or l.p. winding a current equal to the full-load current. The most accurate method is to excite on one side and inject on the other side. If for reasons of voltage or supply considerations the excitation and boosting have to be supplied to the same winding, then one transformer will be slightly out of balance with the other for excitation, owing to the drop of voltage across the booster. To obviate this, the excitation supply should be connected to the middle point of the booster if this point is available. For earthed transformers, which are usually for high-voltage service, the excitation and loading must necessarily be carried out on the l.p. side due to the high voltage

that would be present across the booster if loading were done on the l.p. side, for this voltage would be twice the impedance voltage of one transformer and would bring the earth point of at least one transformer to a possible unsafe voltage above earth.

The loading of three-phase transformers is carried out in a similar manner, but due to the numerous methods of phase connection possible it presents a more difficult problem. With some forms of phase connection three-phase injection of load currents is the only means possible.

Insulation Tests.—These should be taken with the insulation in its weakest condition (at the full-load temperature) so that these tests should follow immediately after the hot resistance measurements. In general, for pressure tests up to 41,000 volts, and over-potential tests up to 40,000 volts, *i.e.*, for transformers rated up to 20,000 volts, the h.p. test pressure can with safety be taken from the transformer ratio of the testing transformer and the transformer under test respectively. For higher voltages the h.p. pressure must be measured by other means due to the increase of voltage brought about by the

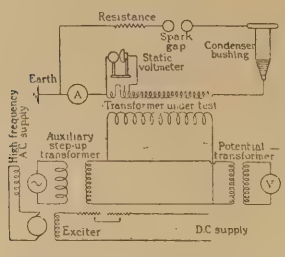

Fig. 8.—Over-potential Test Layout.

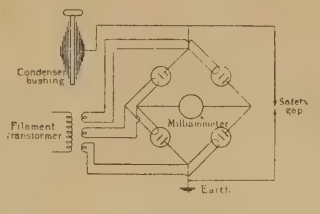

Fig. 9.—Four-valve Crest Voltmeter.

capacity of the windings; pressure-rises of 35 per cent. have been measured above ratio voltages when testing transformers for 115,000 and 136,000 volts. Static voltmeters for very high voltages have not been found satisfactory due to their delicate adjustment and susceptibility to vibration and draught. For over-potential testing, the spark-gap is recommended as the most reliable means of measurement, the calibration being that given in the Standardisation Rules of the American Institute, with corrections for barometric pressure and temperature. Fig. 8 shows a scheme of connections for an over-potential test on a high-voltage transformer.

When abnormal tests are required, such as three or four times the normal voltage, a high frequency is necessary to obtain this test value. With high-voltage transformers very high frequencies are apt to bring about complicated conditions and troubles, and it is recommended that a frequency not greater than 175 be used for high-voltage testing and over-potential testing. Where abnormal tests are required necessitating a higher frequency than 175 periods, the authors have advised other means of obtaining the voltage without creating disturbing conditions. The method involves two sources of supply, one at a high frequency, say 200, and another at 50 or 66.6 periods, and the superimposition of one supply upon the other. The resultant wave is a distorted one, but the period of maximum voltage is not less than the lower frequency of supply. To obtain the best condition the higher frequency should be a multiple of the lower, thus giving a regular peak voltage.

Pressure Test.—This should be measured in a similar manner to over-potential, *i.e.*, by a spark-gap or a crest voltmeter, which functions on the principle that the average charge current of a condenser is proportional to the maximum impressed voltage. To obtain the average value of the charge current it is necessary to rectify the alternating current and measure its value on a d.c. milliammeter. In order to use the crest voltmeter the testing transformer must be fitted with a condenser bushing or a fixed standard condenser, the earth band of the bushing being insulated from the tank and the charge current passed through thermionic valves or mercury rectifiers to earth. The rectified current is measured by a d.c. moving-coil permanent-magnet milliammeter. Fig. 9 shows the full-wave rectification method which is to be preferred, as the current measured is approximately twice that of half-wave rectification, depending on the total impedance of the valves and condenser circuit. The small pointed spark-gap shown across the condenser and the earth terminals takes the main charge current when a heavy current passes through the terminal bushing condenser, which would otherwise spark across between the plate and filament of the valves and probably burn them out.

The arrangement of the test and procedure are similar to that for over-potential testing. The spark-gap is used as a measure of test voltage, and the crest voltmeter as an indication that the voltage has been reached when the gap is disconnected.

In conclusion, the authors express their thanks to the Metropolitan-Vickers Electrical Co., Ltd.

Discussion in London.

MR. S. A. STIGANT congratulated the authors on the manner in which they had written their paper. Usually papers were so long and full of detail that the practical man had to go to considerable trouble to extract just those parts which were useful to him. From this point of view the paper before them was one of the best that had ever been presented. He endorsed the authors' view that such tests should be devised as would give the most accurate results, but apparatus and means used to that end should not be elaborate. For drying purposes, when vacuum plant was available in large works, that was the best method, but transformers could be dried without a vacuum. He agreed with the remarks concerning errors introduced by commercial types of wattmeters at high frequencies. A single-phase single limb test would give the same result as a 3-phase test. If condensers were used across the power supply, the machines needed for supplying the power could be smaller, and if power was purchased a better power factor would be available.

MR. S. W. MELSOM thought the paper valuable because it put forward just what they wanted to know. The use of a Megger for insulation resistance testing was a good method, but not of the highest accuracy. The author mentioned that the Megger voltage should be applied for 60 seconds, whereas the makers suggested a very much longer application. The reading taken with the transformer in oil would be lower, but how much lower? And would the fall be immediate or after a time, as determined by the diffusion of moisture in the oil? What did the author mean when he referred to the "infinity reading"? He emphasised the need for accuracy, but adopted an almost pre-historic method for the measurement of resistance by ammeters and voltmeters. That suggested the authors had probably never used the Kelvin bridge, or if they had, they had not understood it. It would give readings in half the time, say 5 times as accurate, and only needed one man instead of two. However, he did not intend his criticism to detract in any way from the value of the authors' contribution.

MR. A. F. W. RICHARDS agreed that accuracy had a big influence on customers', confidence, and he hoped manufacturers would not lose sight of the authors' suggestions. A great deal depended on the use of proper instruments for the various tests, especially so in iron-loss tests. Resistance tests should be the easiest, but they often gave much trouble, as Mr. Melsom had indicated. He, the speaker, probably knew most of the test beds in this country; many of them lacked suitable instruments, and only one provided fixed instruments for this test. Generally, methods were haphazard and instruments were used for other purposes without due regard to the test conditions. Frequently hours are wasted due to such things as leads sparking to earth in high-pressure tests, and these occurrences suggested that test-bed methods should be improved and brought up-to-date.

MR. J. BLOOME suggested that the 2 and 3-wattmeter methods gave different results; the same result could be obtained, but only after much trouble. The form factor played a very important part in iron-loss measurements, and it was well worth the attention which the authors had given it. He congratulated the authors on their vector diagrams for a 3-phase core-type unbalanced magnetic circuit. For pressure measurements he regarded the tachometer as all that was necessary, and for resistance measurements used an

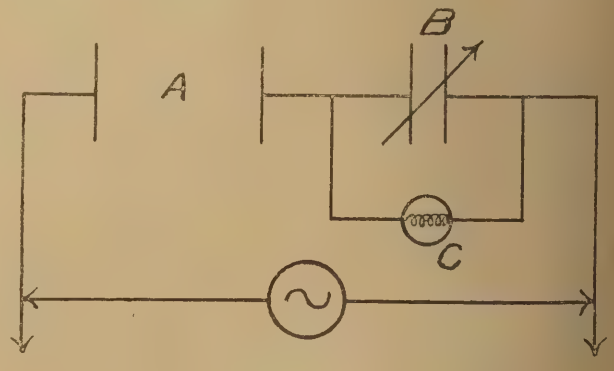

Fig. 10.—Suggested Crest Voltmeter.

ohmeter, which he found better than an ammeter and voltmeter. The instruments should not be moved between hot and cold tests, the former being obtainable in three minutes.

PROF. J. T. MACGREGOR-MORRIS referred to tests which he had helped to carry out when he was a student under Prof. Fleming; they were described in a paper that was discussed for five evenings, and in those days it was not uncommon to argue over errors of 5 per cent. in wattmeter readings. He was impressed by the advance that had been made since those days, as indicated in the valuable paper before them that night. In connection with crest voltmeters, he outlined an instrument which had been developed by a student under him, and independently elsewhere, which was independent of frequency. As shown in fig. 10 it consisted of a large capacity (A) and a smaller variable capacity (B) while (C) was a neon flash lamp; if certain precautions were taken regarding the neon lamp, its striking voltage could be relied upon to within 1 per cent., probably 0.5 per cent. The method of operation was to vary the smaller condenser (B) until the lamp flashed or, if it was alight, was extinguished. Such a simple instrument could probably be developed for pressure of 100,000 volts or over.

MR. F. S. ROBERTSON, referring to the authors' crest volt-

meter, pointed out that the illustration did not indicate to what the grid of the 3-electrode valve was connected. If it was unconnected, nothing would flow through the valve.

MR. F. E. OCKENDEN said that he could not agree with the authors' statement that the static voltmeter was not very satisfactory in connection with the measurement of iron losses.

MR. H. M. LACEY was somewhat mystified by the authors' explanation of fig. 3. He could not read quite sensibly the explanation of the effect shown.

MR. J. L. THOMPSON, replying, said that the paper was the authors' reply to remarks which had been heard concerning tests carried out in the past. The drying of transformers might easily take three weeks, but could be reduced to three days by the vacuum process, representing economy in time and money. The measurement of iron losses by tapping was simple, but might be inaccurate due to disturbance of the flux. He did not like Mr. Stigant's suggestion about condensers; their use might be very dangerous owing to values being reached which could not be calculated. Their paper was originally about 3½ times its present length, but for various reasons it had to be shortened. It must be remembered that he was dealing with shop processes and not laboratory methods. If service conditions could be met during the shop tests, so much the better, but if to do so would involve expense and loss of time, the matter would have to be considered from a different point of view. The measurement of resistance by an ammeter and voltmeter was a shop method; it was not possible to keep such instruments as had been mentioned in the discussion, in proper condition in the shops, although of course they were highly accurate in the laboratory. Regarding hot-spot temperature measurement by thermo couples, the difficulty was to find the hot spot. He did not favour the use of couples, because they must be so placed that they would involve a great risk of life to the test man who took the readings. Drying transformers by short-circuiting was also a risky business which he would not undertake, especially when large transformers were concerned. The grid of the valve crest-voltmeter illustrated in fig. 9 was not connected to anything. They were only concerned with the high peak voltage, and therefore the accuracy at the lower end of the scale was of no consequence.

The Rand Turbo-Alternator Failure.

Some Further Interesting Details.

WITH further reference to the recent failure of one of the German-built turbo-alternators in the Vereeniging power station of the Victoria Falls and Transvaal Power Co., South Africa, more details of an interesting nature have been published in the *S.A. Mining and Engineering Journal* (from which the accompanying illustrations are reproduced). It is explained that immediately before the accident occurred, in the early hours of the morning of December 8th, 1925, No. 1 machine (which was isolated from the rest of the station and feeding

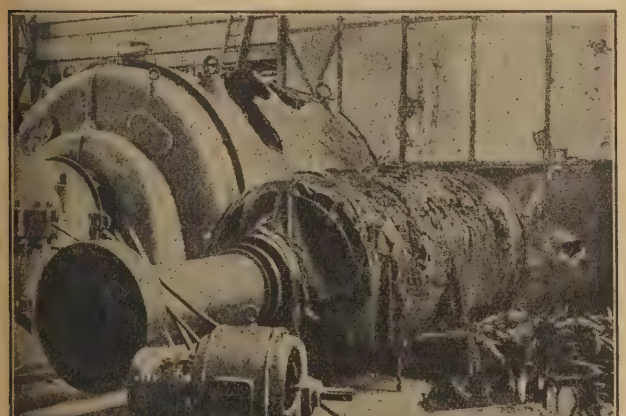

Fig. 1.—Spare Rotor and No. 3 Alternator; Part of No. 2 Rotor Embedded in Floor.

one 80,000-V line) had tripped, and that No. 3 (which was in parallel with Nos. 2 and 4, feeding the other three lines) had come off the bus-bars owing to the operation of the neutral protection gear which was set sensitively. The switchboard attendant had just noted that No. 2 machine was carrying 11,000 kW, and was on his way to the telephone to get into touch with "Control," when the smash-up took place. Most of the flying metal of the stator and rotor went, roughly, in the direction of rotation. The portions which travelled across the Vaal River, went through the roof almost vertically. One-third of the stator went through the western gable and landed within reasonable distance of the station. One-third is believed to have gone downwards through the bedplate, while part of the other third at least crossed the Vaal. The rotor did not indulge in quite so much travelling; part of it went vertically downwards, and part towards No. 3 machine through the floor (which formed the top of an access passage) and came into contact with the spare rotor seen in fig. 1, lying between Nos. 2 and 3 machines. The spare rotor struck No. 3 stator, fracturing its feet and moving it sideways on its bed, but not enough to close the air-gap of the machine and damage No. 3 rotor. No. 3 stator was ruined, as the top of the carcase was smashed by flying metal which passed over the top of the spare rotor. An extraordinary feature, however, was that No. 3 machine's end-shields were not moved or damaged, all the bolts attaching them to the stator carcase shearing. The end

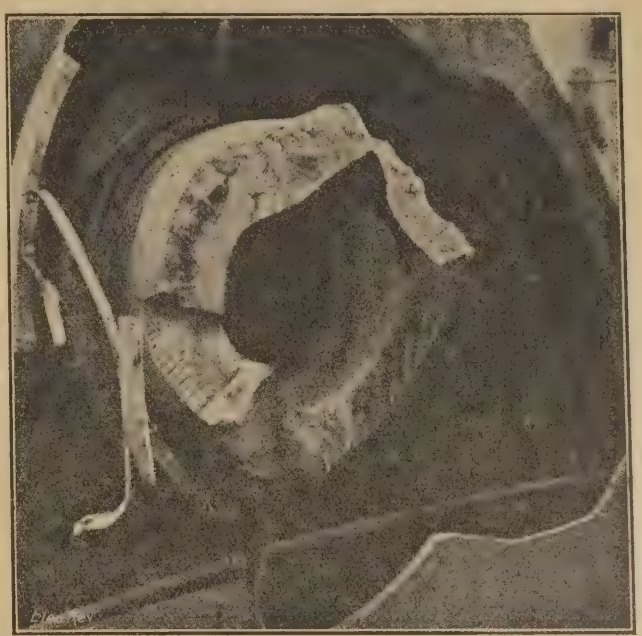

Fig. 2.—Fractured Rotor Shaft.

shields of No. 1 machine were badly damaged, but by replacing them with the undamaged ones from No. 3 generator, No. 1 set was restarted promptly. Thus the spare rotor, though destroyed itself, saved the rotor and end shields of No. 3 set. (Moral: Don't place a spare part in a position where it will be destroyed by the very event it is intended to guard against.) The rotors of the machines in this station are in two parts: one consists of the barrel with plates and windings, together with a drawn-down end, forming the centre bearing and carrying the half-coupling. The exciter end of the barrel fits on the second part, the exciter end spindle, by means of a spigot joint kept up by a number of axial bolts. The male spigot end with the full ring of fractured bolts showed that the first-mentioned portion of the rotor failed, and that, as seen from fig. 2, the barrel only got loose; this picture also indicates that the barrel and spindle, which are one forging, are hollow, and that the break took place just where the change in the diameter of the shaft began. Moreover, on approximately the horizontal diameter, to the left, will be seen what looks like an axial flaw. The fracture seems to show fine-grained crystalline metal rather than fibrous, tough, indications. The journal quoted concludes: "We do not wish to speculate on causes, preferring to await the report of the inquiry, proceeding as we write."

Movements in the Radio Industry.

Suggested Reorganisation.

CONSIDERABLE attention was given by the *Wireless Trader* in a recent issue to the movements which are taking place in the radio apparatus industry. The National Association of Radio Manufacturers and Traders includes in its policy means for controlling the discounts given by manufacturers to dealers. A number of prominent members of the Association became dissatisfied with this arrangement and as they could not secure the "decontrol" of discounts they resigned or are resigning. The advocates of the Association's policy point out that discount control places all manufacturers on the same footing where terms and trading conditions are concerned, while allowing them full freedom in fixing their selling prices. One manufacturer, when interviewed by our contemporary, averred that a new manufacturers' association existed in a provisional form and was arranging to treat with the N.A.R.M.A.T. It was stated that the new association was prepared either to absorb the N.A.R.M.A.T. or to be absorbed by it provided that in its permanent form the combined association was solely for manufacturers and that there was no attempt at discount control.

The *Broadcaster and Wireless Retailer* speaks of the "critical stage in the evolution—possibly the dissolution—of the N.A.R.M.A.T." It considers that the radio trade would be

greatly strengthened by the reorganisation of the manufacturers' section of the N.A.R.M.A.T. as a separate association or the formation of a new and "really national" association; the formation of a separate Association by the wholesalers; the joining of a reputable association by retailers—the Wireless Retailers' Association is mentioned; and the establishment of means to keep these bodies in touch with each other. The *Broadcaster* also deals with the question of price-cutting, and it is suggested that to stop this "every firm trading in this country should be attracted to membership of one or other of the three bodies, regardless of nationality."

It is stated that the radio industry has developed to a specialised and largely independent industry of enormous proportions, appealing to a world public, yet it is a child of the electrical trade, and is still so regarded by that branch. It is doubted whether any industry has such a large number of trade organisations as the electrical industry, or so much inter-weaving of interests between them. This influence of electrical manufacturers' organisations and their characteristic partiality for price control was unmistakably evident in the early activities of the N.A.R.M.A.T., but, of course, was totally unsuited for the industry which is different from all other industries. Our contemporary says: "The N.A.R.M.A.T. has done a lot of useful work for its members, and we hope that its apparent apathy with regard to general trade opinion on matters of policy is but a passing phase which will speedily be remedied."

The Association was prominent last week at one of the hearings of the Broadcasting Committee when Mr. W. W. Burnham (the chairman) gave evidence on its behalf. He said, according to *The Times*, that his Association represented the three main elements of the radio industry—the manufacturer, the wholesale distributor, and the retailer. The manufacturing section numbered 76 members, and comprised the most important British radio manufacturing concerns; the wholesalers' section had 102 members, all of whom were pledged to deal in British-made wireless goods only; and the retailers' section, now in process of formation, numbered 415, also similarly pledged. His evidence was based on members' reports, and could be regarded as expressing the considered opinion of the industry. It was estimated that some 40,000 people were directly employed in the radio industry, and the turnover last year was from 10 to 12½ million pounds. In addition ancillary or subsidiary trades had been greatly benefited by the advent of the radio industry. British radio manufacturers had been able to launch out in the world's markets owing to the excellence and reasonable prices of their apparatus. They considered, therefore, that in any matters affecting the broadcasting system in this country, the welfare of the radio industry should be studied. They thought that the time had arrived when some simple form of receiving set should be available at a reasonable price, which would provide the entertainment required, on the lines of the domestic gramophone. It would be a simple matter for manufacturers to supply such apparatus if the broadcasting authorities would provide sufficient power and suitable alternative programmes. The Association believed the present system of low-power main stations and relay stations to be absolutely wrong. It was considered that competent radio engineers could divide the country up into six or seven zones, in each of which a high-power station—say, 25 kW—could be erected. The Association also recommended the erection of a super-power transmitting apparatus for national and long-distance broadcasting. The bulk of the Association's members were in favour of broadcasting remaining in the hands of one independent authority and not passing under Government control. They considered that the capital needed by such an authority could be easily found by the issue of guaranteed 7½ per cent. debentures or bonds, and the income for running the service obtained from licences, as at present. All interests concerned should be represented on the Board of Control. They considered that the manufacturers' interest in the management should be in a greater proportion, as their highly-trained technical research people had been connected with the development of wireless transmission from its infancy, and as they also controlled all the patent rights.

Trade-Mark Applications.

THE following are among the recent applications for British trade marks. Objections against any of the proposed marks may be lodged within one month from January 20th :—

Unic. No. 459,471. Class 6. Dynamos, starter motors, magnetos, &c., all being parts of motor-car machinery.—Unic Motors, Ltd., 18, Brewer Street, S.W.1.

Oco. No. 464,627. Class 6. Electric vacuum cleaning, sweeping, and hair-drying machines.—Oco Electrical Appliances, Ltd., 128-132, Shaftesbury Avenue, W.1.

Brandes, Ltd., experts in radio acoustics (lettering and design). No. 463,744. Class 8. Radio-telephonic apparatus and component parts thereof.—Brandes, Ltd.

Sidar, No. 464,207, Class 8, electron discharge tubes for radio and wired telegraphy and telephony, X-ray tubes (not for medical or surgical purposes), and rectifying tubes; and P.M.4 (lettering and design), No. 464,923, class 8, thermionic valves.—Mullard Radio Valve Co., Ltd.

Lowforma. No. 464,732. All goods in Class 8.—A. H. Clackson, Ltd., 119, Fleet Street, E.C.4.

Artoid. No. 464,972. Class 8. Scientific and philosophical instruments and apparatus for useful purposes.—E. A. Graham, trading as Alfred Graham and Co.

Galloy. No. 464,976. Class 8. Radio-telephonic apparatus and parts thereof.—Climax Radio Electric, Ltd., Quill Lane, Putney, S.W.15.

Beech Tree (lettering and design). No. 462,601. Class 13. Electrical contacts and terminals, fittings, accessories, &c.—Birmingham Specialities, 80-81, Bath Street, Birmingham.

Phonor. No. 463,177. Class 13. Electric horns and alarms for use with motor vehicles.—Pierre Robin, 295, Avenue Jean Jaurez, Lyons. (British representatives: Haseltine, Lake & Co., 28, Southampton Buildings, W.C.2).

Published Specifications.

Compiled expressly for this journal by Patent Agents.
The name of the applicant's patent agent, if any, will be found on the printed specification.
The numbers in parentheses are those under which the specifications will be printed and abridged, and all subsequent proceedings will be taken.

The

Electrical Review

VOL. XCVIII. FEBRUARY 5, 1926. No. 2,515.

THE OLDEST ELECTRICAL PAPER. ESTABLISHED 1872.

Published every FRIDAY, Price 6d.

Chairman: H. ALABASTER.

Technical Editor: A. H. ALLEN, M.I.E.E. *Joint Managing Directors:* G. H. ALABASTER. E. A. GATEHOUSE, M.I.E.E. A.M.INST.C.E. *Commercial Editor:* A. H. BRIDGE.

Manager and Secretary: E. S. MIDDLETON.

OFFICE: 4, LUDGATE HILL, LONDON, E.C.4.

Telegraphic Address "AGEEKAY, CENT., LONDON." Code, A B C. Telephone No.: Central 7072 (Three Lines).

The "Electrical Review" is the recognised medium of the Electrical Trades, and has by far the Largest Circulation of any Electrical Industrial Paper in Great Britain.

SUBSCRIPTION RATES, Postage Free: United Kingdom, £1 14s. 8d.; Canada, £1 12s. 6d. Colonial and Foreign, £2 1s. 6d. per annum. Cheques and Postal Orders (on Chief Office, London) to be made payable to THE ELECTRICAL REVIEW, LIMITED, and crossed "Midland Bank, Newgate Street Branch."

Auxiliary Machines on Steamships.

WHILE the use of electricity for the propulsion of ships does not appear to meet with any great degree of favour in this country, it is gradually becoming recognised that for driving the auxiliary machinery, the electric motor offers one of the most economical and reliable forms of drive available. We recently drew attention to the rapid development in the use of electricity for driving the auxiliaries on motorships (ELECTRICAL REVIEW, January 8th, p. 47), and by a strange coincidence, in a paper entitled "High Efficiency Steam Installations for Ship Propulsion, with Special Reference to the Question of Auxiliary Machinery," read on Tuesday last before the Institute of Marine Engineers, the author, Mr. Stanley S. Cook, dealt with the advantages of using electricity on ships propelled by steam engines. The motorship is, of course, in a different category to the steamship as regards the driving of its auxiliaries, as it would be obviously impossible to use a small oil engine for driving each of the auxiliary machines. The steam engine, on the other hand, can be built for very small powers, and on many steamships the bulk of the auxiliaries are driven by separate small steam engines. Indeed, in comparing the economy of the different forms of auxiliary drive available on board a steam-engine-driven vessel, Mr. Cook considered first of all the steam drive, for which, as a result of actual measurements made under service conditions, it may be said that the fuel consumption of the auxiliaries represents about 15 per cent. of the total consumption of the vessel.

Three alternative systems are, however, available, and in this paper a comparative estimate is drawn up for each of these for a cargo vessel of average dimensions propelled by steam turbines of 5,000 shaft horse-power. In the first of these a turbo-generator is employed, the turbine receiving high-pressure steam, and thus working under the most economical conditions, while the auxiliary machines are driven by electric motors. In the second alternative a Diesel engine is used to drive the generator, the arrangement being otherwise as before; and in the third, the auxiliaries are mechanically driven by the main engines. The last-named system need not be seriously considered despite its economy, as it is not favoured by marine engineers owing to the

vibration which it causes in the turbines and the gears. The steam-electric and the Diesel-electric drives effect a considerable saving in fuel as compared with the steam drive, the figures given by Mr. Cook showing that after all possible allowances and corrections have been made with the steam-electric drive, the total fuel consumption for the vessel, *i.e.*, main engines and auxiliaries, is reduced by 2.85 per cent., and for the Diesel-electric drive by 7.6 per cent., with the same main engines in each case. Thus, taking 15 per cent. of the total consumption as representing the consumption of the steam-driven auxiliaries, it will be seen that the use of the electrically-driven auxiliaries reduces the fuel consumption of the auxiliaries by 19 per cent. in the case of the turbo-electric drive and nearly 51 per cent. in the case of the Diesel-electric drive. It is apparent, therefore, that the use of electricity for driving the auxiliaries on a steamship yields a very considerable economy in fuel consumption, and at the same time there are the considerable advantages which are inseparable from the use of small, high-speed rotary machines instead of the slower and therefore larger and heavier reciprocating machines. There is thus considerable scope for the production of electrical machinery specially suited for the conditions met with on cargo steamers.

Battery-charging Stations.

The rapid development of broadcast radio-telephony has reacted on the electric accumulator-charging business, and battery-charging stations have consequently been established in somewhat large numbers all over the country. We notice that one of the motoring journals considers that many of the new stations are of mushroom growth and are run by men with very little electrical experience; its complaint that numbers of accumulators are daily being ill-treated, or permanently injured, confirms our own opinion on the subject.

On the principle that there is no smoke without fire, it may be assumed that there is some justification for the criticisms above quoted. In view of the fact that practically all motor vehicles are nowadays fitted with accumulators for lighting and engine-starting purposes, there is no doubt that there are plenty of excellent opportunities for profitable business in battery-charging and maintenance; not only is there a considerable demand for similar service from hundreds of thousands of users of radio-telephone apparatus, but also an increase in the number of the conveniently-located depôts which cater for the needs of battery-propelled vehicle owners would influence electric vehicle progress considerably.

However, for such a business to be a success, it is imperative that it be conducted on the right lines, from the point of view of both equipment and expert supervision. This fact has been realised by some of the principal battery-making concerns, which in recent years have organised excellent "service" and hire-maintenance systems, selecting for such work only establishments that may be relied upon to give satisfaction to customers and so assist in building up the makers' business and goodwill. It would appear that neither all battery-charging concerns nor all electricity supply authorities quite appreciate the mutual benefits that will accrue from arrangements that permit of accumulators being charged at such times as will not coincide with the generating station's peak load, and the adoption of other measures which will assist battery users to obtain charging energy at a reasonable cost. The price demanded for re-charging batteries, in the case of "wireless" accumulators at any rate, is far too often out of all proportion to the "service" rendered and the electrical energy utilised in the process.

It behoves all whom "the cap fits" to see to it that any grounds for complaint are removed forthwith, otherwise they will realise when it is too late that the future of their individual businesses has been seriously affected by the more satisfactory service rendered by the really efficient establishments.

Wireless Trade Organisation.

A good deal of interesting matter has been appearing in the wireless papers for several months past regarding the chaotic position of the radio-apparatus trade. We quoted some notes on the matter in our last issue, and further references are reproduced in our "Business Notices" to-day. A significant comment appears in the current number of the *Wireless Trader* under the heading "The Locarno Spirit." Our contemporary's considered policy has been the establishment of "one strong representative association for the regulation of the wireless industry," but though it has received views from many quarters on the policy of the N.A.R.M.A.T. and the efforts to evolve "a satisfactory trade government," it has decided to postpone their publication at present, in the interests of peace. It has been led to adopt this course because it understands that substantial progress "is being made toward the reconciliation of the views of all parties to the controversy" and in the hope that the time "may have arrived" when "the least said, the soonest mended." The electrical industry having passed through many similar periods of trial in the course of its progress toward efficiency of organisation, views with sympathetic interest and optimism the efforts of this lusty member of its family to establish itself upon a satisfactory and lasting foundation.

Co-operative Protection Against Fraud.

The way of the trader is beset with many difficulties, and not the least of these is the existence of a large number of dishonest people who obtain goods and resort to numerous tricks to avoid paying for them. Certain branches of the electrical industry are particularly affected by these practices, and there have been many cases in which dozens of firms have been swindled of thousands of pounds by these parasites of trade. Some of them operate in a most astonishingly brazen manner, and their nefarious actions can be recognised for months before they can be brought to justice. It is then too late: the imposition of a term of imprisonment may act as a warning to others dishonestly disposed, but it brings only poor consolation to a trader who has been defrauded of hundreds of pounds' worth of goods. In these circumstances the F.B.I.'s scheme of co-operative protection against this kind of fraud should be of inestimable benefit to those who take the trouble to participate in it. It is extremely difficult for the Press to secure the necessary detailed information to enable it to expose offenders so as to cut short their practices. We have had some experience ourselves in trying to do so, and know only too well how definite must be the reported offence before the police can take the initiative; therefore full use should be made of the confidential exchange of information arranged by the F.B.I. system, as this appears to be both safe and efficacious. Elsewhere in this issue we publish a note on the methods adopted by defaulters. While these will be familiar to most of our trade readers, they may be put on their guard against very plausible scoundrels of undoubted, if misapplied, ingenuity, and be persuaded to take part in the endeavour to purge industry of these undesirable elements.

The Origin of the Electricity Scheme.

Whenever any great scheme of national importance is adopted, there must necessarily be a large number of persons to whom credit is due for bringing it to pass; and this applies to the Government's new proposals for electricity supply. We have seen many claims regarding this in the daily Press since Mr. Stanley Baldwin made his announcement, but not a single reference to the real author. It is rarely that the true and undisputed origin of any far-reaching scheme is so clear as in this instance. We need only refer our readers to the *Journal* of the Institution of Electrical Engineers, dated June, 1916, which contains a record of the paper on "The Electricity Supply of Great Britain," read by Mr. Ernest T. Williams, O.B.E., M.I.E.E., on April 13th, 1916, before the Institution in London, and discussed in London and

Manchester.* Many leading electrical engineers took part in the discussion, which would doubtless have been taken up by the lay Press had not war news overshadowed everything else.

The Institution appointed a Committee to consider the subject in the light of Mr. Williams's paper, which made recommendations to the Board of Trade Committee on Electrical Trades; and later the Committee presided over by Sir Archibald Williamson was set up, whose report brought the matter into the forefront. The Electricity (Supply) Act of 1919, which, *inter alia*, set up the Electricity Commission, was the first step in carrying out Mr. Williams's scheme. Regarding this, the chairman of the North-Western Centre of the I.E.E., in 1919, Mr. J. A. Robertson, stated that "the first actual step in this direction was taken by the reading of Mr. Williams's paper before the Institution early in 1916. This paper put forward bold comprehensive proposals for national electricity supply under a Board of Commissioners in London. The scheme included the erection of super-stations, transmission lines, and supplies in bulk to local authorities over districts to be set up by the Commissioners." About the same date the Chairman of the Western Centre, Mr. Arthur Ellis, said: "You will no doubt remember that very instructive and interesting paper which was read before the Institution by Mr. E. T. Williams in 1916. . . . Mr. Williams has undoubtedly done a great and lasting service to the country." In reviewing the question we find that the Government's present proposals are in fact the completion of Mr. Williams's original scheme, which dealt with the electricity supply of the country as a whole, and aimed to encourage its development not by nationalisation but by the encouragement of private enterprise under an Electricity Board, working on commercial lines without a subsidy and without dispossessing existing undertakers. Indeed, we may say in brief that the only real difference between the Government's proposals and those put forward by Mr. Williams in 1916 is that, whereas Mr. Williams proposed one Board to deal with the whole problem on both its administrative and executive sides, the Government apparently intends to leave the administrative work in the hands of the present Electricity Commission constituted under the Act of 1919, and to set up a new Electricity Board with executive powers for dealing with generation and transmission, to be responsible to the Electricity Commissioners.

Whatever views may be held as to details of the scheme, there can be no question that Mr. Williams was the author of all its essential features, and we trust that he will receive that recognition to which he is entitled.

The German Steel-Electrical Combination.

We have already referred to the big scheme for the constitution of a German coal and iron and steel trust that will combine most of the collieries and iron and steel works at present owned separately by the Thyssen group, the Rhine-Elbe Union (represented by the Deutsch-Luxemburg Company, the Gelsenkirchen Company and the Bochum Verein), the Phœnix Steel Works Company and the Rhenish Steel Works Company. The proposed amalgamation has taken provisional form by the establishment of the Ver. Stahlwerke A.G. (United Steel Works Company) so as to prepare the way for the definite creation of the combination under this title with an ordinary share capital of £35,000,000, and a controllable production of, say, 6,000,000 tons of steel per annum, and a still larger output of coal and coke. As there is every prospect of the constitution of this trust being realised—for such realisation now depends upon the question of the settlement of the taxes payable on the formation of the company and upon the successful financing of the undertaking—the change will naturally be accompanied by an alteration in the relations which have existed for some years past between the Rhine-Elbe group, the Siemens and Halske Company, and the Schuckert Electricity Company directly, and the Siemens-Schuckert Company indirectly. Having regard to these circumstances, the Siemens and Halske Company has issued a communication stating that the constitution of the trust will affect in important points the community agreements which were concluded between this Berlin company, the Deutsch-Luxemburg Company, the Gelsenkirchen Company, and the Schuckert Company. On all sides, the Company states, the wish is expressed for the future maintenance in some form of the close and friendly relations which have developed between the interested firms and their managers during the years of co-operation, in order in the first place that no interruption may occur in the work carried on in common for the promotion of technical development. From this point of view negotiations as to the future relations between the interested parties will shortly be begun.

At present a method of pooling the profits exists under the community agreements, but having regard to the transfer of the coal and iron and steel properties to the new trust, this system will come to an end with the actual formation of the trust. This then is one of the important problems which will be subject to revision, while a second relates to the directorships held by representatives of the Rhine-Elbe Union on the boards of the electrical manufacturing companies. Under these circumstances the latter will secure greater freedom of activity than has prevailed during the past few years. In this connection it is stated that the idea has arisen for constituting a European (?) electrical trust in which the Siemens-Schuckert works would participate in a manner similar to the participation of the Rhine-Elbe Union in the steel trust, but for the moment no information is available on this particular point.

The Cost of Electrical Energy.

In our issue of January 1st we published an article, based on the Electricity Commissioners' Statistical Returns for the last year available (1923), showing how the quantity of fuel consumed per kilowatt-hour generated varied with the output of a large number of generating stations. Whilst full allowance must be made for the lack of completeness of the data, the results recorded were extremely interesting, and in some respects surprising.

We now print in this issue a second article by the same competent hand, and based upon data from the same inexhaustible source, in which a comparison is instituted between the cost of electricity to the consumer, as represented by the average price obtained for it, and the output of the undertaking by which it is supplied. Here, again, some allowance must be made for varying conditions which do not appear in the statistics; but in this case the comparison is less open to criticism, and the results are equally noteworthy and significant. Whatever differences may obtain in respect of the load factor, the date of purchase of the plant, the situation of the undertaking, the nature of the district, and similar considerations, they are likely to affect both small and large stations in the mass in much the same way; and at any rate, the best results obtained can reasonably be compared as indicative of the relative performances of the undertakings. Coal varies over a wide range of quality, and some of the largest stations use very low-grade fuel, which on a weight basis makes a bad showing, but there is no such variation in the value of pence; the cost of the energy supplied is, in journalistic jargon, the "acid test," which appeals even to Cabinet Ministers. If a station cannot supply cheap energy, it will fail to satisfy the examiners who are to sit on the Executive Board. On the other hand, if a station can and does supply cheap energy, on what grounds can it be condemned? Merely because it happens to be a small one?—Some of our smaller stations are in this sense amongst the most efficient.

We do not advocate the cause of the small station *versus* the big one; we merely appeal for common sense in dealing with the question of electricity supply. Large industrial communities must necessarily be served by large power stations, but it does not follow that small ones cannot as economically, efficiently, and expediently be served by smaller stations; that is a proposition which remains to be proved.

---

* ELECTRICAL REVIEW, April 21st, May 19th, and May 26th, 1916.

The Relationship between Cost and Output.

A Comparison of some Electricity Supply Undertakings.

(Communicated.)

It has been shown in a previous article* that, as the size of power stations increases beyond an output of about 10 million kWh per annum, there is, generally speaking, no particular decrease in the coal consumption per kWh generated. Whether this is as it should be is another matter, which need not be discussed now. The circumstance, however, prompts a further inquiry, namely, whether the larger undertakings are able to sell electricity at prices much, if any, lower than the smaller ones, and if so, whether there is any limit of size beyond which any further increase in magnitude has no advantage to the consumer. For the latter, provided always that his supply is reliable, has no interest in anything but price. He does not care what the coal consumption may be, nor what the capital charges or running expenses may amount to. His only concern is to get his electricity at the cheapest price, and he wants neither explanations nor excuses.

The duty of an electricity undertaking is to give the consumer cheap electricity, and it is granted a monopoly on the understanding that it will do so. "Cheapness," of course, is a relative term, but so is "reliability," and so are a good many other words, the meaning of which is well understood. Again, electricity for lighting may be cheap and electricity for power may be dear in one and the same area. Rates may be varied as between different classes of consumers, either on the principle of "what the traffic will bear," or in accordance with a deliberate policy of encouraging the use of electricity for particular purposes. Rates, however important, are a matter of detail. The real test of the service of an undertaking to the community is the average price demanded per kWh for all purposes. The community as a whole is made up of individual consumers, and the less the aggregate amount of money extracted from their pockets in return for the electricity they consume, the better, on the average, are they served.

From this point of view it is interesting to see what are the average prices charged by undertakings of different sizes. Although some may be more fortunately situated for cheap supply than others, it is possible by taking a sufficiently comprehensive survey to arrive at some idea of how the cost varies with output. Stations of any particular size are not confined to any one locality, so that the good fortune of one will be offset by the bad fortune of another, if a fair number of undertakings are considered together. Graphical methods afford by far the best means of demonstrating relationships such as those we are considering. The whole of the facts correlated are brought under review simultaneously, and the eye can strike an average, or observe the trend of events, far more surely from a diagram than from numerical tables. Hence data bearing on the relationship of selling price to output of electricity abstracted from the "Return of Engineering and Financial Statistics" of the Electricity Commissioners are presented graphically in fig. 1. The points in this diagram refer to 153 electricity undertakings having outputs of less than 20 million kWh per annum. Undertakings of larger size will be considered separately.

* ELEC. REV., January 1st, 1926; p. 5.

For the purpose of the diagram, the whole of the local authority undertakings in England have been brought under review. Company undertakings, which are listed separately in the Commissioners' Return, are left out of consideration merely to keep the number to be dealt with within reasonable limits. There is, however, no reason to suppose that the relationship between price and output would be substantially different were the company undertakings included. Another class of undertakings which has been omitted from the diagram is that in which the whole, or the greater part, of the electricity supplied is purchased from some other undertaking. There are altogether 42 of these, mainly, of course, quite small in size, but since many of them are able to purchase energy from large power companies at very favourable rates, it would have been misleading to have brought them into comparison with local authorities of equal size which have to generate their own supplies. The only other undertakings omitted are a very few for which information was not available, and three little ones whose average selling price was more than 8d. per unit.

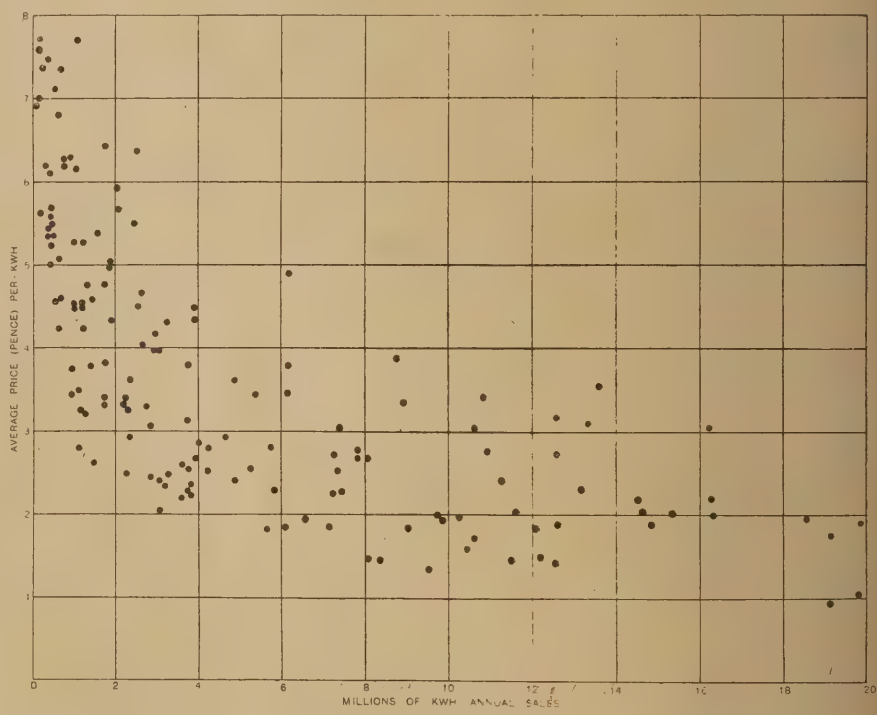

Fig. 1.—Price and Output of Electricity Generating Stations, under 20 million kWh per year.

Every undertaking is represented by a point corresponding to the total number of kWh sold during the year ending March, 1923, and also to the average selling price per unit. Circumstances will have altered slightly since the date of the return, but it is unlikely that the general conclusions would be much altered were the comparison to be made to-day. A glance at the diagram is sufficient to show how widely the price varies as between different undertakings. With a few exceptions, both above and below, the average price charged by undertakings with outputs of less than a million lies between 4d. and 8d. The next group, with outputs of from one to two millions, charges on an average between 2.5d. and 5.5d. Prices continue to get better till an output of 4 millions is reached, and after that, although there are some good undertakings between 8 and 13 millions, what improvement there is is slight and erratic.

Had the undertakings purchasing all or the greater part of their electricity been included, the advantages of this course in the case of small systems would have been strikingly manifest. There are, for example, nine

local authorities selling less than five million kWh each annually which can afford to retail the energy at an average price of less than 2d., a feat which is not possible in any case where these small outputs have to be separately generated. Four of these authorities indeed can charge less than 1.5d., and two actually less than 1d. Of the local authorities with sales of less than five million units, the Stafford Corporation easily leads with an average price of only 2.04d. for a sale of only 3.078 million units. Stafford generates the whole of its electricity itself, and with a coal consumption of 4.02 lb. per kWh and a load factor of only 19 per cent., it undoubtedly is selling cheaply. Worcester is another fortunate city. Like Stafford, it produces the whole of its power, and manages to retail it at an average of 1.82d. per unit, with total sales of only 5.670 millions. It certainly has two little water turbines aggregating 320 kW capacity at Powick, but these only amount to about 6½ per cent. of its total plant, the rest being steam. Gravesend is to be congratulated also on selling 6.081 millions, all generated by the Corporation, at an average price of 1.85d. The fuel consumption of 2.61 lb. per kWh is also very good for so small an undertaking, and this, together with the sale of 130 B.th.u. per head of population at a load factor of 34.4 per cent., also indicate sefficiency of management.

The smallest local authority undertaking able to sell energy at an average price of less than 1.5d. is West Hartlepool, which charges only 1.48d. for its 8.078

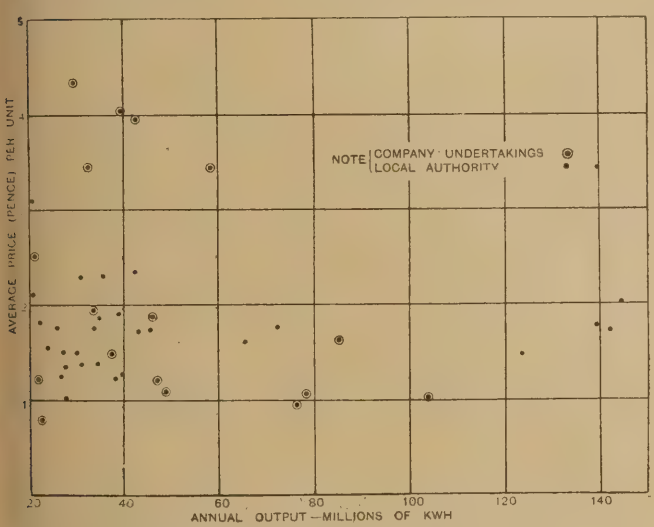

Fig. 2.—Price and Output of Stations, from 20 to 150 million kWh. per year.

million units, but nearly 2.4 million of these are bought wholesale from a power company. West Hartlepool, moreover, rejoices in a load-factor of 39.9 per cent., so that its capital charges are proportionally reduced. The Rawtenstall Corporation has neither of these advantages, and so its price of 1.46d. for 8.370 million units is extremely creditable. It generates the whole of its electricity itself, with a coal consumption of only 2.30 lb. per kWh, and shows what can be done with good management in a little station with five generating sets averaging only 1,900 kW each. The Darlington results are also rather remarkable. Here we find 9.527 million units, all generated by the Corporation, sold at a price as low as 1.35d. The load-factor is not good, being only 22.5 per cent., and the coal consumption of 3.44 lb. per kWh is by no means very good either. The only other authorities to sell below 1.5d. are Lincoln, with 11.513 millions at 1.46d.; Luton, with 12.197 millions at 1.49d.; York, with 12.547 millions at 1.43d.; St. Helens, with 19.136 millions at 0.96d.; and Bury, with 19.823 millions at 1.05d. The fuel consumptions of these five undertakings are respectively 2.31, 2.84, 2.78, 2.52 and 2.44 lb. per kilowatt-hour.

We will now turn to the consideration of undertakings with annual sales of from 20 million kWh to 150 million kWh. As these are less in number than the smaller ones, all that there are in Great Britain, whether owned by companies or local authorities, will be taken together. The prices charged by these undertakings are plotted in fig. 2 over their respective annual outputs; the local authorities being designated by plain dots and the companies by dots surrounded by circles. As will be seen from the diagram, both the dearest and the cheapest prices are charged by company undertakings, the extreme limits being an average charge of 4.34d. on an output of 29.624 million units by the Metropolitan Electric Supply Co. and an average of 0.79d. on an output of 22.170 millions by the Mersey Power Co. The latter company has a load factor of 45.1 per cent. against 23.8 per cent. for the Metropolitan Co., but even this seems hardly adequate to account for the difference.

Besides the Metropolitan Co., there are four other companies and one local authority which charge more than 3d. as an average price for their energy. The local authority is Nottingham, where 3.10d. is charged on an output of 20.402 millions. At the date of the return, the Nottingham coal consumption, however, amounted to the frightful figure of 6.15 lb. per kWh, and matters should be very different now that the new station is in operation. The four companies which come into the same class as regards price are all, like the Metropolitan Company, concerned with the supply of London. One of these, the Westminster Electric Supply Corporation, purchases nearly five-sixths of the energy it sells, but since the company it buys it from only receives an average price of 1.19d. for its product, the purchase price hardly seems to account for the selling price of 3.45d. per unit. Even so, however, this is a lower price than that charged by any of the four other companies mentioned.

After the Mersey Company, in point of cheapness comes the excellently-managed Lancashire Power Co., with an average price of 0.95d. for an output of 76.156 million. This company has the extraordinarily low fuel consumption of 1.80 lb. per kWh. The cheapness of electricity in many small towns in Lancashire is primarily due to the operations of this company, which supplies in bulk at a very low price for distribution by the local authorities. Lancashire is indeed generally fortunate in its electricity supply, no other area, except the North-East coast, being better served. Within the range we are considering, the Stalybridge Electricity Board comes next after the Lancashire Power Co. in respect of price, as it charges only 1.01d. on an output of 27.727 millions. The undertaking having the largest output dealt with on the diagram is that of Liverpool with 144.444 millions. The price of 2.01d., it may be noted, is also high, exceeding that of any other undertaking with a sale of over 60 millions.* It would appear from the diagram that any price exceeding 2d. per kWh on an average may be considered high for undertakings ranging from 20 to 150 million kWh annual output. The smaller plants, also, seem to be able to sell as cheaply as the larger ones, especially if we omit certain London undertakings whose charges rise to such ignoble eminences.

The only two undertakings with outputs exceeding 150 millions are those of Manchester Corporation and the Newcastle-on-Tyne and associated companies. The Manchester output is 185.639 million kWh, which is sold at an average rate of 1.77d. per kWh. The Newcastle undertaking sells 442.873 million kWh at an average price of 0.76d.

Throughout this article the present tense has been used, although the figures are not now quite up to date. They are, however, the latest that are available, at any rate in a form convenient for reference. Even did they completely reflect the circumstances of the moment, they must in all cases be interpreted with reference to local conditions. The instructed reader will be able to draw his own conclusions from them, especially if they are examined in conjunction with the vast amount of other data contained in the Return from which they have been taken.

* The Liverpool figures cover a period of fifteen months, and include those for the undertakings of Bootle Corporation and the Liverpool District Lighting Co., which were acquired in 1922.—Eds.

Some Troubles of a Lighting-Set Maker.

By "SARCASTICUS."

There is an attraction in the manufacture of house-lighting sets from which few of the engineering industry are exempt. The engine maker, the electrical contractor, the agricultural engineer, the ironmonger, the factor, all at times fall victims to its lure, and embark lightheartedly upon the manufacture of yet another "Brown-Light" or "Jones-Light," as such plants are usually named. In the attempt to analyse the fascination which this trade exercises over the imagination of the hard-headed man of business, let us peep through the morning mail of a typical maker, and see what the day brings him in the way of opportunities of service to the public, help to the trade, and possibly a little profit for himself.

Inquiries.

If our maker has only lately entered the field, he will be agreeably surprised by the number of inquiries which have followed his *début*. Apparently the new plant fills a want hitherto unsupplied by the well-known and long-established makers, whether of English or foreign origin. A little later on he will perhaps also be surprised (this time disagreeably) at the proportion of such inquiries which his various sales experts are able to turn into orders. The reason for the initial flood of inquiries is not that there are several hundred people who are wanting to purchase electric-lighting plants, but have purposely refrained from doing so until the appearance of the new set overcame their hesitancy; it merely indicates that there are this number of people interested either in the manufacture or the marketing of competing sets who naturally wish to find out for themselves whether the new make is going to mean any serious competition for them either on the score of price or efficiency. The new maker will also as time goes on be able to remark how curious it is that the moment the largest maker periodically drops his list prices yet another £5 all round, agents for both this and other sets send out wholesale prices to every known manufacturer for prices of lighting sets, many of them so cunningly worded that the optimistic might almost be led to believe that there were numbers of orders ripe for placing.

Extent of the Market.

The total turnover which is being done in lighting sets throughout the country is apt to strike the newcomer as truly terrific considering the general state of trade in other directions. It would be indeed difficult to find the contractor who would be so modest (or so truthful) as to confess to installing anything less than two or three dozen of these per annum, and when we multiply this number by the total number of electrical contractors throughout the country handling such business, we shall see what a truly vast field there is for exploitation by the pushful maker or the energetic salesman in this line. The resulting roseate figure is confirmed (to a certain extent) by the details which we hear from time to time of the total number of sets which certain manufacturers and certain importers sell during a normal year. A "normal" year, I may explain, is, in the average maker's opinion, the turnover for the year 1919-1920 multiplied by a certain factor which varies from 2 to 6.

Sales Resistance.

Nor does the "sales resistance"—to quote a much-used American salesmanship term—appear to be so high as might be expected. Not only does every contractor and dealer seem to do a large and regular business in installing such plants, but in addition the morning's mail will show that a large number are prepared to back up their claims by taking a set upon "sale or return" terms, and exhibiting it in the showroom free of all charge whether for rent or attendance. There is perhaps observable a certain reluctance to discussing the question of ultimate payment and certain other details of the loan, but this is of course due entirely to the fact that the maker's set is unknown in that particular district. "Clear-Light" and "Glow-Light" sets have been selling there in huge numbers, and the inquirer has no doubt that the new set will sell at sight—if it is really as good as the maker's catalogue states! Of sales resistance in the case of actual business I will not now speak, excepting to say that it is slightly more difficult to overcome.

Service not Profit.

If our glimpse through the mail bag of such a maker is made anywhere about the tenth of the month, we may be excused for wondering whether the standard of engineering knowledge in this country is quite so high as we had supposed, to judge from some of the curious complaints which are received. This feeling of pessimism, however, will be corrected if we draw upon our commercial experience and remember that this is a time of the month formerly dedicated to the payment of accounts and the signing of cheques, but now devoted chiefly to the penning of complaints. In the majority of cases, a complaint of any kind is good for another month's credit at the least, and if it is addressed to a maker who is thoroughly imbued with the spirit of free service, it will also bring such assistance as is truly surprising.

Our first letter of this kind, which causes a gloom to settle over the establishment, is to complain that the semi-automatic plant tested so carefully before despatch and upon installation will not start, and unless it is put right that same day it will be thrown out into the street, &c. A little journey of some hundred miles on the part of a mechanic shows that the battery has been discharged to such an extent that there is not sufficient current to motor the generating set round and start the engine firing; and the mild suggestion that in such a case the starting handle is really the cheapest and easiest method of getting the engine under way, provokes the stern rebuke that the plant was supposed to be fool-proof, and that such an occurrence should not be possible.

The next letter which (following hard upon the last) seems likely to provoke a sudden heart attack, is to say that another engine cannot be induced to start, that the whole countryside is watching the trouble which is being experienced, and that it is likely to spoil all chances of future business in that neighbourhood for another twenty years. This time it is a journey of a couple of hundred miles, and upon arrival the mechanic is mystified for a full couple of minutes until he turns his attention to the "petrol" which is used for starting purposes, and finds that a lighted match fails to ignite it! A walk over to the nearest garage, the purchase of a tin of real petrol, and another troublesome complaint is satisfactorily settled. Upon other "serious complaints" which involve the changing of a sparking plug, or the timely replenishment of lubricators, space and still bitter recent experience will not permit me to dilate.

The Electrical v. The Agricultural Market.

But whatever may be the occasional shortcomings of an interesting trade, there is little doubt that to the maker of small oil engines it has opened out a market which is vastly more satisfactory than the agricultural trade, upon which (prior to the advent of the house-lighting set) he had to rely for the majority of his home sales. Only those who have had to deal with the agricultural trade for a few years, and consequently are acquainted at first hand with its slow and uncertain methods, who know the number of years which it takes a farmer to make up his mind that he requires a 6-h.p. engine, and then the number of years over which he thinks payment should be spread, and the vastness of

the allowance which he requires upon the chaff-cutter (date *circa* 1850) tendered in part payment, only those will realise with due thankfulness that the electrical market, in spite of its occasional shortcomings, offers a greatly more lucrative, a more business-like, and a more satisfactory field than the old. On a bad day, a maker may be tempted to abuse the electrical contractor, but honesty will compel us to admit that, compared with some others, he is almost free from fault.

A little time spent in perusing the daily post of an average maker will quickly show that at the present time the manufacture of house-lighting sets offers more opportunities for service than for profit, but with the coming of better trade and the circulation of more money, it is probable that many of the difficulties which confront such a maker will be banished, giving place to a state of things more nearly resembling the idealistic picture which an outsider is accustomed to regard as a true presentment of a manufacturer's position and emoluments.

Electrical Traders' Accounts.

The Special Features of Practical Book-keeping for Electrical Traders.

By S. HOWARD WITHEY, F.C.I., &c.*

HAVING regard to the quantity and the variety of equipment, appliances, &c., in which the electrical trader now deals, it is very necessary that a good and appropriate system of internal check should be instituted, and it is in close relation to internal check that the trader's accounting and book-keeping should be based.

Commencing with the orders received, which are the real foundation for all the subsequent entries in the books of account, it will be found convenient to record these in a manifold order book, one form being used for each order. The original sheet will, in each case, be passed on to the person or department immediately concerned in the execution of the particular order, the copy being retained in the manifold book. As soon as an order is fulfilled, the original sheet should be cancelled, and the price extended into the cash column in the manifold book, which will then constitute a kind of rough sales book and order book combined. All unfulfilled orders of unduly long standing should be immediately investigated to prevent any being only partially fulfilled, or overlooked altogether. All orders, without exception, should be recorded in this manifold book, whether they have come to hand through the post, from agents, travellers, salesmen, &c., or have been received verbally.

The credit sales transactions should either be passed through a printed day book, or sales book, or a duplicate invoice book should be kept. Both these methods have their peculiar advantages. If the printed day book method is adopted, the book should be ruled with additional money columns to enable the various transactions to be systematically classified under their appropriate headings, such as "Cables," "Fuse Cases," "Dynamos," "Tubing," "Bends," &c. Duplicate invoice books are best kept on the pen carbon-copy principle, the original forms being the actual invoices sent to the customers and trade debtors, the copies constituting the book of original entry from which the personal accounts will be debited in the sales or customers' ledger. Care is necessary to ensure that any alteration made on an invoice after it has been torn from the duplicate book is effected, also, on the copy; otherwise the sum charged against the customer in the traders' books will most probably be incorrect.

Instead of having a separate sales account for each different class of sale, such as "Dynamos Account," "Cables Account," &c., it is much better to rule extra columns on the credit side of the general sales account, these columns being headed to correspond with those under which the sales transactions have been dissected.

If the number of returns inwards transactions is at all considerable, a separate sales returns and allowances book should be kept, consisting of copies of all the credit notes actually sent out by the trader. The entries made in this book will be analysed in the same manner as the sales book entries, and the monthly totals should be deducted from the corresponding monthly totals of the sales book, and before the latter are posted to the credit side of the sales account. In those cases where the number of returns inwards transactions is really few, they could be recorded in the end section of the sales book.

The amounts recorded in the purchase book, or bought journal, should be in accordance with the details shown on the invoices received in respect of equipment, appliances, materials, stores, &c., purchased. Separate analytical columns should be ruled for the classification of the purchases under the particular headings, and also for the various expenses as these become payable, in order that the totals may be readily available for posting purposes. The entries shown in the purchases returns and allowances book should be numbered in consecutive order with the credit notes actually received by the trader and filed, the monthly totals being deducted from the monthly totals of the purchase book.

If irregularities in the matter of cash are to be prevented, the trader should personally open all letters, &c., received, and should, at the same time, make a note in a private diary of all cash received. The system should provide for all cash received, whether in the form of cheques, bills, drafts, notes, coin, or postal orders, being paid into the bank intact, and by ensuring that all amounts entered in the diary have been actually deposited, the possibility of irregularities will be reduced to a minimum. An alternative method of controlling the cash received may be adopted by the trader, consisting of entering each item on the counterfoil of the paying-in book, the detachable portion being filled in later by the person actually paying the money to bank.

When all the cash received, without exception, is paid into the bank, all payments (except, of course, petty cash payments, for which a separate petty cash book should be kept) will be made by cheques, and consequently it will be sufficient to have two columns on the credit or payments side of the cash book, for "discount" and "bank" respectively. It will, however, be necessary to have an extra "cash" column on the debit or receipts side of the cash book, in which will be detailed all the amounts of cash received, the total of these amounts being simply extended into the "bank" column upon paying the cash into the bank. Subject to any unpresented cheques, and any cash paid to bank but not yet credited in the bank pass book, the balance of the "bank" columns of the cash book should exactly correspond with that shown in the pass book, providing all items representing interest, bank charges, &c., have been duly entered in the cash book.

*Mr. Howard Withey is the author of "The Book-keeper's Vade-Mecum," "Converting into a Limited Company," "Banking," &c.

It is very important that proper distinction should be drawn between capital items and revenue items. In this connection some of the principles which govern a discrimination are illustrated below:—

Goodwill.

The original payment for goodwill is a capital charge, but being an intangible asset, the method favoured by the writer, in the case of the electrical trader, consists of showing the item on the assets side of the balance-sheet at cost, and deducting therefrom any reserves earmarked for writing it off. The position is then very clearly defined.

Repairs and Renewals.

Amounts expended in the maintenance of any asset are charges against the periodical profits. If, however, the real value of the asset is increased by reason of the expenditure, the amount involved should be debited to the account of the particular asset, and an adequate sum written off each year to cover depreciation through wear and tear, obsolescence, or lapse of time.

Leasehold Property.

The cost of buying leasehold property should be debited to the leasehold property account in the trader's private ledger, as also should, for the time being at any rate, all legal expenses incurred in connection therewith. The annual profit and loss account will be debited with all repairs, ground rent, and depreciation to provide for lapse of time, and also with the legal expenses as soon as possible. The cost of extensions to buildings is a capital charge, including any wages paid to the trader's own employés who may have been employed in the extension operations. The amount expended in the repair and maintenance of the extensions should be written off against the profits, as well as annual depreciation.

Plant and Machinery.

The plant and machinery account should be debited with the cost of purchasing new or additional plant or machinery, and also with the cost of carriage paid on it. If any repairs are necessary to make second-hand plant or machinery immediately efficient, the expenditure involved should also be debited to the asset account. Other repairs will be charged against the profits, and also the amount necessary to write off the old asset displaced, and depreciation of the additional plant or machinery.

Fixtures and Fittings.

The cost of installing electric light, telephones, fixtures, &c., is capital expenditure, but all expenses incurred in their maintenance should be charged against the profits.

In the matter of stocktaking, particular care is necessary to ensure that none of the following are included in the stock sheets:—

(1) Any asset, such as plant, machinery, transport, &c., the value of which is shown in a separate ledger account.

(2) Any equipment, appliances, goods, &c., received by the trader for sale on behalf of the consignor, but which have not been included in the periodical purchases.

(3) Any equipment, appliances, goods, &c., which have been sold and included in the periodical sales, but have not yet actually left the trader's premises.

Provision for bad debts may be made by calculating a certain percentage of the total book debts, but the better method consists of carefully examining each item in the list of debtors, making at the same time a sufficient allowance for sums uncertain of collection, or known to be definitely bad. The total of these allowances should be charged against the profits and credited to a bad debts reserve account, the final balance of which will be deducted from the "sundry debtors" on the assets side of the balance-sheet.

After depreciation and all losses and liabilities have been provided for, a reserve may be created, consisting of sums set aside out of the profits, either for the specific purpose of equalising the profits, or in order to strengthen the financial position of the business. A reserve may, however, be undisclosed as the result of an actual appreciation in the value of such assets as investments, land, buildings, &c., or by the omission of such items as goodwill, patents, &c. Secret reserves may consist, also, of excessive amounts charged against the profits to provide for future liabilities, or for depreciation of any asset, or the value of business premises, stock, &c., could be shown at a lower figure than actual value.

In cases where a general reserve has been built up, and patents are a large item, the value of the patents could remain in the trader's books at cost, but much will depend upon whether or not the intrinsic value of the monopoly will really diminish. Renewal fees should, however, be debited to the annual profit and loss account.

Fuel Economy and the All-Electric House.

By E. W. DICKINSON.

The admirable paper by Prof. S. P. Smith, D.Sc., on the "All-Electric House," read before the Institution of Electrical Engineers on December 3rd last, raised an interesting discussion that evening, and is likely to form the nucleus for lively controversy for some little time to come.

An "All-Electric House" is, of course, a proper ideal for every electrical engineer to have, and to keep well in remembrance of his neighbours, but it is inclined to wilt when looked at from the point of view of the conservation of the nation's fuel supply.

Dr. S. Z. de Ferranti, whose house is out of reach of a distributing main, informed the meeting how he had decided that his own domestic requirements, involving heat, lighting, and power, were best served by converting to useful purpose 60 per cent. of the calorific value of fuel in the shape of oil. This he did, so far as could be gathered, by obtaining light and power in the form of electricity through conversion in an internal-combustion engine generator set, the hot water being obtained from the engine cylinder cooling system. Had the oil been burnt in a super-power station at the present day, probably not more than 17 per cent. of the heat value of the oil would have found its way into the home. One wonders whether Dr. Ferranti, confronted now with an opportunity of obtaining a supply of electricity from the mains for a new home, would jump at it.

Electrical engineers are not yet in a position to drive home with successful argument a statement that electricity is cheaper than coal or gas for domestic heating purposes, nor that its sole use, to the exclusion of gas, results in fuel economy in the widest sense.

It is necessary to take a wide view of this question if we are to do our duty to our neighbour as to our profession. Professor De Baufre, speaking recently at the University of Nebraska, concludes that "civilisation as it is organised to-day, and with it the possibility of leisure from the immediate struggles for existence to be devoted to research and philosophy, to the

arts and pleasures of life, depends more on mechanical power than on any other factor."*

In this country mechanical power is mainly dependent on the energy released by the combustion of our coals. The greater the caution and skill exercised in converting this energy to our needs, the more surely will our reserves of energy be conserved, and the more definitely shall we be able to meet successfully all foreign competition.

For cleanliness and convenience in lighting, and for power purposes in the home, electricity reigns, or will reign, supreme, but for domestic heating the case is not so convincing. Whilst admitting the convenience of the electric radiator, which can be taken to any part of a room, or from room to room, with the greatest ease, and admitting the ready sale of such apparatus, even with electricity at the present price, the case for using electricity for continuous heating should be advanced with caution. The best thermal efficiencies obtained from the conversion of heat in the coal to electricity delivered at the terminals of our super-power stations is from 18 to 20 per cent., with an average, say, of 15 per cent. A further 10 per cent. to 15 per cent. of the electrical energy so converted is lost in distribution. Little objection can be raised to an assumption of 100 per cent. efficiency in the use of electricity as a heating agent in the house; but at the very best only between 16 and 18 per cent. of the original heat value in the fuel burnt under the boilers of a super-power station is available as heat in the home.

In the case of the destructive distillation of coal in an up-to-date gas works, gas and coke are produced containing respectively 25 per cent. and 50 per cent. of the original heat value of the fuel. The remaining 25 per cent. represents the loss in manufacture, and includes the energy used to disintegrate the raw coal as well as the power used for charging the gas holders. It therefore includes the distribution losses of the gas between the works and user.

The loss in heat when gas is burnt by a mixture of air by means of gas ring, oven, and gas fire may be taken, on an average, to be about 50 per cent. in a normal household. The loss is due to the escape of hot unwelcome products which must be carried away and do pollute, it is true, the outer air; but they perhaps help to ventilate the house, and in any case do not produce smoke.

In the case of coke, one may say that, used in an open fire, it delivers 25 per cent. of its heat into the room; and when used in a closed stove, 50 per cent.—say 35 per cent. on the average.

From these reasonable premises we come to the conclusion that, using electricity in the home for heating, cooking, and washing, about 17 per cent. of the original heat of the coal fired in the power station is available; whereas by the destructive distillation of coal, forming gas and coke, about 30 per cent. is retained for similar domestic purposes:—

Original c.v. of coal at gas works.	On leaving gas works Per cent. of original c.v. of coal.		Efficiency in use	Available as useful heat in the house.
100%	Gas	25%	50%	12½%
	Coke	50%	35%	17½%
	Total			30 %

If we burnt the coke in the power station under boilers on, say, the sandwich system, instead of 30 per cent., we would have available 21 per cent. of the original c.v. of the coal:—

Gas, 12.5% + coke (17.5% of 50%)
= 12.5% + 8.75.
= 21.25.

and at the same time we would have avoided the necessity of using raw coal at the electric power station to the extent, roughly, of the weight of coke used. There and at the same time we would have avoided the necess- would be a gain here through diminished emission of smoke from the power-house chimney.

When confronted with hard facts of this character it behoves electrical engineers to advance with caution, and in this attitude of mind it might be well that they should admit the superior position held by gas where it is superior, and see in what directions advance can economically be made, little by little, with real hope of success.

One of these directions may be indicated by asking why the electrical industry should not consider marketing a gas-electric cooker, the top (or "hot plate") of which would be fitted with a gas grill and rings, and the oven heated with electricity? A pudding in a pan, or a stew in a pot, is unaffected by the gas fumes from the hot plate, but what an unwholesome idea it is to surround "bakes" and "roasts" with the heated and noxious products of gas combustion! Those who know the difference between the taste of a joint roasted in an electric oven, or by the wasteful wood- or coal-fired kitchener, and one roasted by gas will appreciate this suggestion.

Another direction in which the day use of electricity for domestic purposes might be promoted with advantage and profit to all concerned, lies in easing and facilitating the labour of the weekly wash. Dr. Margaret Fishenden has pointed out the substantial economy of the coke-fired domestic hot-water supply boiler, and the gas-heated electric washing machine also tends materially in this direction by eliminating the need for a separate coal-fired wash copper.

Electrical enthusiasts (and the author is one) who still describe gas as a "dangerous explosive" may regard these suggestions as an attempt at an unholy alliance with the enemy; but meanwhile, the only economically available means must of necessity be related to desirable ends.

Advances will, without doubt, continue to be made in the use of electricity; but the *all*-electric house does not appear to be within the bounds of economic possibility in this country at present.

* *The Times*, January 11th, 1926.

National Electricity Supply.

Conferences and Consultations.

ACCORDING to the daily Press, the series of meetings arranged by the Minister of Transport with representatives of the interests likely to be affected by the Government's electricity scheme (including the electrical manufacturing industry, the Joint Council representing power undertakings, and the gas industry) have indicated that the proposed Bill is destined to have an easier passage through Parliament than was at first anticipated by the Government.

It is understood that the subject is to be discussed at a meeting arranged in Birmingham by the South-Midland Centre of the Institution of Electrical Engineers and the Institution of Mechanical Engineers.

Birmingham Chamber of Commerce.

The Council of the Birmingham Chamber of Commerce, at a meeting on January 25th, decided to address a communication to the Board of Trade urging that before any definite proposals for the reorganisation of the electricity supplies of the country are placed before Parliament the opinions of the manufacturing and industrial interests of the country should be consulted.

Mr. GILBERT C. VYLE, in moving a resolution embodying this decision, said the Prime Minister had brought forward an electrical proposition, from which they could only gather some faint comfort. He had suggested that such areas as Birmingham, the Clyde, and part of the North-East Coast, which were on the 25-periodicity standard, should have some special arrangement made for them. What that special arrangement was the Prime Minister did not say. He said there would be considerable expenditure in standardising electrical supplies, but that it would not fall upon the State. The only thing they could deduce from that was that it would fall upon those who might be outside the standard chosen. In that case it would seem that a heavy expenditure would fall upon Birmingham manufacturers. Therefore, they suggested that when the Government came to consider the details of the scheme, the manufacturing and industrial interests concerned should be consulted.

The President (Councillor H. E. PARKES), in seconding the resolution, described the matter as of very grave importance to the manufacturing interests of the district. They were told that an important committee had gone very carefully into the facts and figures of this enormous electrical scheme. He had no doubt it had, but he felt that before a scheme of that magnitude was definitely decided upon, all parties interested should be placed in a position to judge as to its

chance of success by being given the basis upon which the scheme was grounded. They had had an example of high hopes of economies in the recent railway amalgamations. In 1921 Sir Eric Geddes stated in the House of Commons that by the amalgamation of the railways they expected to save 25 million pounds a year, and mention was made that there would be a possible saving of 45 million pounds in six or seven years. They were now five years from the time the statement was made, and recently the railway companies had the opportunity of claiming one-third of the savings under the amalgamation scheme; all they could claim was £1,770,000—an enormous difference. He felt that the business community ought to be in a position to examine the basis of this immensely important electrical scheme before it was placed before Parliament.—*Birmingham Post.*

Municipal Undertakings' Committee.

A meeting of the Association of Municipal Corporations to consider the Government's electricity scheme was held in London on January 29th, presided over by Sir Lewis Beard (Town Clerk of Blackburn), and, on the motion of Sir John Utting (chairman of the Finance Committee of the Liverpool Corporation), it was decided to elect three representatives of the largest municipal electricity undertakings, three representing those of medium size, and three representing the small municipal undertakings, to meet nine representatives of the Electrical Engineers' Association to consider the advice which the municipalities could tender to the Government in relation to the framing of its electricity scheme.

A further meeting of the Municipal Corporations' Association will be held to consider the report of the Committee and to decide on the advice to be given to the Government.—*Birmingham Post.*

Mr. Stanley Baldwin on Electricity Supply.

At Sunderland, last week, the Premier addressed a large meeting on various features of the Government's policy. With regard to electricity supply he said :—" I want to repeat this—that while cheaper and more abundant supplies of electricity are admirable in themselves, and indeed necessary, they will not alone restore good trade or give us industrial peace. Don't be led away by excitable people who seem to think that electricity in two or three years is going to transform the face of the country and make coal of no further use. The truth is, of course, electricity can be put to many uses, but it is a striking thing that with the growth of electricity in other countries where it has been developed more than here, it has led, or if you like been accompanied by, a growth all along the front of industry, with a growth in the use of gas and in the use of coal, and a development of industry generally.

" Expressions of doubt and fear have been heard from those who are interested in gas. There is assuredly room, not only for electricity and gas in this country, but for an enormous development of both.

The Views of Mr. Geo. Wilkinson, M.I.E.E.

" No national supply of electricity, even if supplied free of charge, can revive trade or recreate general prosperity without ' the will to work ' on the part of labour and the creation of a more amicable relationship between employers and employed. That is the first essential. At the present moment it seems to be taken for granted as an accepted gospel that the establishment of a number of super-stations supplying extra-high-pressure three-phase energy, and linked together by trunk mains embracing the whole country, is the certain way to provide cheap electricity everywhere. Unfortunately such high-pressure trunk mains involve enormous capital outlay and considerable permanent charges in maintenance, while transmission through them of much power for long distances can only be achieved by a heavy waste of energy.

" Well-designed electric generating stations of from 6,000 to 10,000 kW capacity located within the area where the supply is required are, in comparatively isolated towns and residential areas, nearly as efficient as the super-station and certainly more efficient than the super-station plus the long and costly extra-high-pressure trunk transmission cables.

" To supply with efficiency and economy the electrical requirements of a whole town to the saturation point through two or three trunk mains from super-stations 25 or 30 miles away is a proposition which has found no solution yet. For many such areas—which are found in all parts of the country—a modern local generating station in combination with that cheapest of all power feeders, a coal train on a good railway line, need fear no competition in efficiency from the super-power stations. Again, there are large areas that can be more cheaply, simply, and effectively supplied by means of the single-phase system. Success or non-success is often contingent on the cost of distribution, and for simplicity, reliability, and good pressure regulation there is nothing better or more effective for non-industrial areas than the single-phase system, and it is worthy of greater attention than it is apparently receiving at present. . . . It is to be hoped that legislation will not be introduced that will lay a cast-iron system down for the whole country; what is particularly applicable to one part of the country may be distinctly retrograde in another. The futility of such methods is shown to-day in the coal industry, where uniformity of method and practice can never give general satisfaction, or restore the industry to its former prosperity. This is possible in one way only, and that is by adopting such methods and practice in each locality as are best fitted to meet the local conditions. The same truths hold good in the electricity supply industry."—*Manchester Guardian.*

Mr. W. B. Woodhouse, M.I.E.E., on the Scheme.

" Mr. Baldwin says that in Chicago the consumption per head is 1,000 units per annum, whereas the average in England is 100. It is interesting to note that in Manchester, where consumption reaches 200 units per head, the price of electricity for domestic purposes is lower than it is in Chicago. The explanation is that we have cheap alternatives to electricity. We have cheap coal and all that that means, so that it is unwise to assume that the amount of use depends entirely on the price.

" A good deal has been said about rural supply, and as to what has been done in other countries. It has been found in all countries that the cost of generation is a negligible proportion of the total cost for providing a supply of electricity in rural districts, and to expend very large sums of money on transmission mains to supply farmers may not prove so economical as, for example, the use of individual oil engines on the various farms. But as public supply is developed for other uses, it becomes possible economically to supply the rural districts. No gain seems likely to arise by forcing this development.

" The Premier's remarks on frequency are of interest, as in Birmingham a frequency of 25 cycles is in use, whereas the standard for the country has been fixed at 50 cycles. It is understood that the Birmingham Corporation has investigated this question, and has decided that no gain is likely to accrue by a change of frequency. In New York two frequencies are in use, and quite recently a very large power station has been laid down to supply a still further amount of electricity at 25 cycles. It will be seen, therefore, that even in America a case has not been made out for a single standard.

" The amount of interchange of power between one coalfield and another is not likely to be great, and so, if different frequencies are in use in different coalfields the disadvantages may not be great enough to justify the change. It is, therefore, entirely a matter of balancing the costs against the savings; and it should be possible to ascertain in each area what is in the best interest of the public. If frequencies are to be changed without delay to one standard, a very large expenditure will be involved; who is to bear it?

" What the industry most wants in the public interest is a continuation on the present lines of development with an assurance to all connected with the industry of freedom from disturbance if their duties are carried out efficiently. The frequent alteration of legislation affecting the electricity supply industry has caused much delay, and in many parts of the country distribution schemes which would find a considerable amount of employment, and which existing undertakers are prepared to carry out, are being held up pending the publication of the Government's proposals.

" The same thing happened before the passing of the last two Acts in 1919 and 1922, and but for this I think the development of electricity supply in this country would have been substantially more advanced than it is at present."

" Without any further legislation the progress of concentration of generation in large stations is already proceeding rapidly, but there must be many parts of the country where a cheaper supply could be given to the consumer by putting down a small local station than by erecting costly transmission mains. Inter-connection of generating stations presents advantages within limits decided by the balance of the savings made and the extra costs incurred, and, generally speaking, there does not appear to be any advantage in inter-connected power stations in different coalfields. Each case must be judged on its merits."—*Yorkshire Post.*

Sir Felix Pole and Railway Electrification.

" A committee of Great Western experts has for about three years been engaged in surveying sections of railway which appeared to offer possibilities for electrification. While many of these sections appeared on the surface to be suitable for the introduction of electric traction, it was in every instance found, on going more closely into details, that no case could be made out that would, under existing conditions, justify the capital expenditure involved.

" But we have not left the matter at that. Just under a year ago the board deputed Sir Philip Dawson to prepare a scheme for electrifying a section of main line, to be not less than about 120 miles in length. He has not, however, yet produced a scheme."

Sir Felix desired to make it clear that the root of the matter was economic. The governing factor, he emphasised, was the cost of electrical power, irrespective of the ownership, of the source of supply. " If," he said, " the railways could obtain their power at a very much lower cost than at present, and if the price per unit could definitely be guaranteed over a reasonably long period, that would, of course, put an entirely different complexion on the whole matter."—*Financial News.*

Traffic Loud-speakers.—In order to assist passengers who are unaccustomed to underground travel, the Underground Railway Company is said to be contemplating the use of loud-speakers at some of the principal stations. It is believed that much of the delay caused by the inspection of sign posts might be avoided in this way, as one man could direct passengers to their proper routes on the " public address " system.

Legal.

Standard Telephones & Cables, Ltd., v. Freeman.

IN the Chancery Division on January 26th Mr. Justice Tomlin gave judgment in an action by Standard Telephones & Cables, Ltd. (formerly the Western Electric Co.) against Mrs. Freeman, of the Crown Works, Poets Road, Newington Green, for an injunction restraining infringement of its patent for improvements in self-supporting electrical coils. Defendant denied that she had infringed the patent.

It was stated in the specification that the invention had for its object the provision of an inductance coil in which the distributed capacity was minimised, thus making the coil very valuable for radio work.

His LORDSHIP, after hearing the evidence, said that he had to solve the problem of the difference, if any, between the plaintiffs' and the defendant's coils. The defendant declared that there was so much divergence between them that nobody could say that they were both made according to the plaintiffs' specification. He could not agree with that, and it was clear to him that the defendant's coil was constructed to give literal effect to the language of the plaintiffs' specification, being wound in the manner there set out. He therefore granted the plaintiffs the injunction asked for, an order for the delivery up of infringing articles, with costs, and an inquiry as to damages, the costs of this to be reserved.

The Reduction of Vickers's Capital.

IN the Chancery Division on January 26th, Mr. Justice Eve approved the reduction of the ordinary share capital of Vickers, Ltd., from £12,500,000 to £4,166,166.

Telephone Manufacturing Co., Ltd., v. Soutter & Sons, Ltd.

SIR EDWARD POLLOCK, the Official Referee, on January 25th concluded the hearing of the case of the Telephone Manufacturing Co., Ltd., against Messrs. Soutter & Sons, Ltd., Hockley, Birmingham, the case having been referred to the Official Referee by the order of a judge of the King's Bench Division (*vide* ELECTRICAL REVIEW, January 15th, p. 107).

The plaintiffs brought the action alleging that the defendants had broken their contract by which they (plaintiffs) were appointed sole agents for the sale of "Soutterware" for four years, and that they had expended large sums in advertising and in the organisation which they had set up and perfected, but owing to the delay by the defendants in carrying out orders they had had to repudiate the contract for which they claimed damages.

Defendants denied that, and counter-claimed for damages against the plaintiffs upon the ground that the latter had improperly repudiated the contract.

In the result the case was settled on the terms that the plaintiffs agreed to pay the defendants £17,000.

False Pretences Charge.

AT Old Street Police Court, on January 26th, Charles Frederick Kidby (29), gramophone dealer, of Brixton, and Alfred Sidney Taylor (42), engineer's fitter, of Stoke Newington, were charged on remand with being concerned together in knowingly obtaining a quantity of wireless goods, value £44 8s. 4d., from Mr. E. E Rooke, with intend to cheat and defraud (*vide* ELECTRICAL REVIEW, January 15th, p. 97, and January 29th, p. 174). Det.-Sergt. Edwards said that Kidby's house was searched, and there were found 152 statements of accounts from various firms from whom defendants had obtained goods valued at £4,000. Those statements had been compared with such books as the defendants had kept, and they found that 38 had been paid, leaving a balance of over £3,000. Defendants' practice had been, chiefly, to get goods to the value of between £20 and £100, and establish credit by paying amounts on account. All the orders sent out by the firm had been signed by Taylor.

The defendants pleaded guilty to seven charges. Taylor was sentenced to 12 months' imprisonment and Kidby to nine months' imprisonment.

Bingley District Council v. Barber.

AT Keighley County Court recently the Bingley District Council claimed £100 for electricity supplied to Richard Barber, a worsted spinner. Mr. H. O. HILARY, clerk of the Bingley Council, representing that authority, said that the current was supplied to Clyde Street Mills, Bingley, under agreement between the Council and defendant, but the point at dispute was whether the supply was to defendant or to the firm of R. Barber & Co., Ltd., which had taken over the defendant's business. Giving evidence, the defendant said he instructed a clerk in the Bingley Council's accountant's office to alter the name for the accounts to that of the company, and he paid the account by cheques from the firm's accounts. The company's affairs were now in the hands of a receiver. Mr. HILARY said that the clerk had been given no authority to make such alteration, and the agreement with the defendant personally had never been altered.

His Honour Judge MCCLEARY accepted the evidence of the defendant as to the interview with a clerk at the Council's offices, and said he was satisfied that what was done by the clerk was adopted by his employers. The Council had also sought to make the company liable for this bill, and from the time of the interview had looked to the company for payment. Now that the likelihood of payment from the company seemed remote it could not seek to make the defendant liable, and the claim would be dismissed, with costs.

Dublin and Lucan Electric Railway Co.

IN the High Court at Dublin, before Mr. Justice Johnston, recently, Mr. Moloney, B.L., applied on behalf of Mr. John Foxall, of Anglesea Street, Dublin, trustee for the debenture holders of the Dublin and Lucan Electric Railway Co., for an order for the winding-up of the company. A representative of the company said that the winding-up petition had been before the Court on previous occasions, and had been adjourned to see if there was any possibility of the line being taken over.

Mr. MOLONEY said that a provisional liquidator was appointed and certain negotiations had been going on for the sale of the undertaking.

Mr. JUSTICE JOHNSTON said he was satisfied and accordingly he would make an order for the winding up of the company.

Mr. MOLONEY said that his Lordship had given the provisional liquidator liberty to carry on negotiations for the sale of the undertaking as a going concern, and he would like that continued. It was probable that the negotiations would be closed at an early date.

Mr. JUSTICE JOHNSTON agreed to continue the power to the provisional liquidator to carry on the negotiations for the sale, and to give him liberty to carry on the existing contracts for the carriage of mails and newspapers, and for electric lighting. He appointed the provisional liquidator as official liquidator, and made the usual order for costs.

Beet-Sugar Company Prosecuted.

THE *Nottingham Evening Post* reports that on January 27th the Anglo-Scottish Beet Sugar Corporation, Ltd., appeared at the instance of the Director of Public Prosecutions, through the Chief Inspector of Factories, before the Nottingham magistrates. The charge against the company was that it had neglected to efficiently protect a brass collar conductor forming part of the screw-cap lamp, in consequence of which an employé, James A. Glover, was killed.

Mr. B. G. SAYWELL, for the prosecution, said that the company generated its own power and employed electricians. On October 29th last Glover and another man were fitting up an electric furnace, and were using high-power pendant lamps suspended from the roof, and in some cases secured by string to the girders. The lamps were of the screw cap pattern, and one side of the lamp filament was soldered to the cap, making it "live." Glover climbed to the roof to alter the position of one of the lamps; his mate heard him shout and saw him with the lamp in one hand and his arm over a girder. The man knocked the lamp out of Glover's hand, and Glover was brought down in an unconscious condition and died soon afterwards. If the lamp had been shrouded Glover would not have received a shock.

JOHN BETT, Glover's companion at the time of the fatal accident, corroborated these statements, and said that the current was 230 V a.c. The electricians, he said, had not been told not to touch the lamps. Medical evidence was given to the effect that Glover died from electrical shock, and a factory inspector said that the lampholders were dangerous. For the defence, Mr. Berryman contended that the electricians should have been asked to move the light. The premises were in course of construction, and therefore were not a "factory" within the meaning of the Act. Mr. Saywell contended that as manual labour was being performed there the premises were a factory.

The Court reserved its decision until advice had been taken upon the legal point raised.

Lapish v. Braithwaite.

This case came before the Lord Chancellor, and Lords Atkinson, Buckmaster, Carson and Blanesburgh in the House of Lords, on January 29th, upon the appeal of the plaintiff from a decision of the Court of Appeal reversing a judgment of Mr. Justice Bailhache. The question at issue was whether the defendant could remain a member of the Leeds City Council while firms with which he was connected had contracts with the Council. Mr. Justice Bailhache held that the defendant was liable to penalties, and awarded judgment for the plaintiff for £10.

The appeal to the House of Lords was dismissed. In giving their Lordships' reasons for this the Lord Chancellor said that under the Municipal Corporations Act, 1882, the defendant was not disqualified to sit and vote on the Council by reason of his being a shareholder in companies which had transactions with the Council. Nor was he disqualified on account of his being managing director of any of those companies. He was then a servant of the company with a fixed salary. If, however, he was remunerated by a percentage or commission on the profits of his company, different considerations would arise. In the present case the defendant was not so remunerated. According to the report of the case in *The Times*, the Lord Chancellor concluded:—"There are now many companies in which most or substantially all of the shares are held by one man, who may also be the principal or governing director of the

company, so that the business is his business in all but name; and if by reason of the exception in Section 12 (2) such a man can remain a member of a municipal body with which his company is in contractual relations, the Section will lose much of its force and value. It is not for your Lordships to suggest the manner in which this danger should be met, but it appears to me that the Legislature might well consider whether the Section should not be strengthened either by extending the disqualification to persons who hold a substantial proportion of the shares in a contracting company or in some other way."

The other members of the Court concurred.

Correspondence.

Correspondents should forward their communications **at the earliest possible moment.** *No letter can be published unless we have the writer's name and address in our possession.*

An Electric Vehicle Association.

Mr. Raymond J. Mitchell's reference to my letter is welcome as coming from one whose articles under "R. J. M." I have always read with interest and appreciation, therefore I pardon his inadvertent humorous allusions. His letter is welcome in another sense, in that he has recently joined the staff of one of the well-known manufacturers of electric vehicles—subsequently joining the reorganised Electric Vehicle Committee in company with the general manager of the same firm, of whose activities we have heard so much of late.

The informal meeting will have to consider among other matters:—

1. Whether the proposed new association would be redundant, or whether the several interests—particularly those of users of electrics—would be better served by such an association devoted exclusively to the one purpose.
2. Its relationship and co-operation with other bodies and committees to avoid overlapping; and its representation on the Council of the E.D.A.

It is conceivable that the influence of such an association as is proposed would be more widely beneficial than deliberations in the restricted confines of a committee, inasmuch as it would afford scope for all to ventilate their views and difficulties on a common platform, especially the users and prospective users of all types of vehicle. Probably we should then hear less of "electrics" being abandoned in favour of other means of propulsion; as contributory causes leading up to such a result would be dealt with in the initial stages, the association would investigate impartially and "nurse" the user in each instance.

The main obstacles to progress are fairly obvious, but the lack of conveniently located charging stations is one of the first that the proposed association should seriously tackle. Each of its members should be furnished with a complete list of public and private charging stations, the proposed association negotiating where necessary with those electricity supply authorities which have not yet fully appreciated the mutual benefits arising from the charging of vehicle batteries at times other than peak loads; and, failing satisfaction in that direction, to adopt other measures to assist users who are members in obtaining energy at suitable locations at a reasonably low cost.

In view of the standardising of a.c. working throughout the country we now have to consider the cost of conversion in every instance, as compared with generating d.c. by gas or oil prime movers. In cases where the electricity supply authority's charges are unreasonable, it is probable that users with private d.c. supply plant may be pleased to render assistance to their brother members. Electricity supply authorities can hardly object to this alternative if they have considered the business as unremunerative to themselves at a reasonable price; although the vehicle may be a consumer in more than one supply area!

As regards the sales of vehicles, much could be advanced by extending cordial invitations to prospective users to attend special propaganda meetings of the proposed association, where suitable papers for the occasion would be read and discussed, dealing with all trade and private uses.

Also, there are influential persons in other walks of life, who are closely studying the health and welfare of citizens and the amenities of city streets and traffic conditions. Such persons would be welcomed and would most probably support and attend the meetings of such an association, which would have a direct bearing on the purifying of the atmosphere of our towns and cities; whereas they might refrain from attending a technical committee.

Demonstrations and exhibitions could also be arranged.

As regards representation on the E.D.A., Mr. Beauchamp's admirable management of which is beyond all question, it should be remembered that several associations are already represented on its Council, and I respectfully submit that the position of electric vehicles would be strengthened by the inauguration of a definite association devoted exclusively to electric vehicles, which association would then be placed on an equal footing with the other associations represented on the Council of the E.D.A. With this in view, I had already approached Mr. Beauchamp for the support of E.D.A., but he could hardly be expected to devote any more time to the proposed association than to any other of the definite bodies and associations already represented on the Council, whose interests he has equally to study.

An electric vehicle association, I venture to suggest, would carry more weight when negotiating with electricity supply authorities direct or through E.D.A., which represents many supply stations—with a view to securing reasonably low-priced energy for electrics. The proposed association would assist the man who purchases an electric automobile to retain it, and not leave him to dispose of it owing to lack of charging facilities.

In conclusion, I welcomed Mr. Mitchell's letter as affording me the opportunity of assuring all those interested that I have not made my suggestion "on the spur of the moment," having watched the progress of electric vehicles during the whole of my 25 years' career in the hard fields of practical experience in electricity supply and its use in several aspects, in my professional capacity having had to face the difficulties of high initial cost of vehicles and lack of convenient charging stations for prospective users.

J. C. Elvy.

London, *January 23rd*, 1926.

The Cost of Living in Madras.

In your issue of December 4th, 1925, you print a statement from a gentleman in Bombay, giving the cost of living in that city. Below, I give the approximate cost of living per month in Madras, which is reputed to be cheaper than Bombay.

1.—House rent (decent bungalow)	Rs.125/-	to	Rs.200/-
2.—Living in boarding house, chummery, or as paying guest in private house	120/-		
3.—Boy (servant)	20/-		
4.—Dhoby (washerman)	8/-		
5.—Ayah	20/-		
6.—Cook	20/-		
7.—Tarmic catch (waterwoman) ...	8/-		
8.—Gardener	10/-	to	12/-
9.—Motor-cycle and side-car ...	25/-	to	30/-
10.—Motor-car (including chauffeur's wages)	150/-		

A bachelor would require 2, 3 and 4. A married man with his own establishment, 1, 3, 4, 5, 6, 7 and 8; in this case the dhoby would probably be Rs.12/- for man and wife, plus Rs.3/- for each child. If he preferred to be a paying guest, 2 (full charge each for self and wife, and probably half for each child) 3, 4 and 5. If he visits the club and goes to one or two entertainments during the month, a bachelor will want at least another Rs.150/-, a married man Rs.225/-, and to this will have to be added the cost of clothes for his wife and children. Madras is a place of distances, and it is necessary to have a conveyance of some kind. A bachelor might manage with an ordinary bicycle, but a married man will require a motor-cycle and side-car, or a motor-car. Chauffeur's wages are from Rs.35/- to Rs.60/- per month.

The Rs.150/- extra includes the cost of running a motor-cycle and side-car.

A Twenty-five-Year Resident of Madras.

Madras, *January 11th*, 1926.

[We are indebted to our correspondent for this interesting information.—Eds. Elec. Rev.]

The Indian Electricity Acts.

May I claim your indulgence, as the only practical means of reaching many electrical engineers in India, not, indeed, for a free advertisement, but for an opportunity of appearing in a white sheet!

In my book, "The Law Relating to Electrical Energy in India," Second Edition (Thacker Spink & Co., Calcutta) there are several mistakes in the text of the schedule, to which my attention has only just been drawn. Into the reasons for these errors I need not enter, but the necessary corrections will be found in your advertisement sheets on February 5th, and I would ask all possessors of the book to correct their copies.

J. W. Meares.

Guildford, *January 29th*, 1926.

Electrical Apparatus on Hire-purchase.

In your issue of January 22nd, Mr. L. L. Robinson suggests that the drawback to the development of electricity in his area is the cost of installation and apparatus, and he suggests a hiring scheme.

This is an excellent idea, but contractors should take the orders and carry them out, and the supply undertaking should provide the financial side of the hiring scheme, which would work better on a hire-purchase basis, and not on simple hire. Contractors could carry out this scheme without the help of the undertaking, but are handicapped in the event of the customer lapsing in payments; their only remedy is to take legal action, which I doubt would produce any good result.

The usual alternative in hire-purchase contracts is the removal of hired goods from premises, but I have an idea that most landlords have a clause in their agreements that fixtures attached to the premises become the property of the landlord.

If the local undertakers officially financed a hiring scheme, the obvious remedy for non-payment of instalments would be disconnection of supply, and this would have the required effect in the majority of cases.

A similar scheme has been working for some time in the motor-car trade, the financing body charging approximately 4 per cent. for the accommodation, and I see no reason why the electrical installation business cannot be run on the same line.

Hy. Freedman, N.R.E.I.C.,
Henfrey Electrical Installations.

London, *January 28th* 1926.

The Italian Electrical Industry.

I have read with great astonishment the article on the Italian electrical industry in No. 2,510, of January 1st, 1926, of your paper.

The grievous assertions contained in that article are completely groundless, and evidence in your correspondent an absolute lack of reflection and prudence. They also evidence in the direction of the paper a deplorable facility in accepting and publishing upon a great Italian industry and the whole praiseworthy body of our engineers some gratuitously offensive assertions.

We regard it as a debt of honour on the part of your correspondent to declare his name or to disavow his article. We take it as your duty to denounce to us the name of your correspondent if he rejects our demands.

I deem it necessary to address you this letter, in my quality of Chairman of the Associazione Nazionale Industrie Elettriche (National Association of Electrical Industries), which represents more than 2.5 milliards of capital stock, with a yearly output of energy of about 3.5 milliards kWh.

Giacinto Motta.

Milan, *January 22nd*, 1926.

[We have received a similar communication from Sig. Ing. Prof. Giuseppe Sartori, President-General of the Italian Electrotechnical Association, Milan, and a telegram from Sig. Prof. G. Ponti, president of the Association Operating Electrical Undertakings, Turin, to the same effect. We regret that the susceptibilities of our Italian friends and confrères have been wounded by the comments of our correspondent in his article. So far as concerns ourselves, we may say that the passages to which they take exception were carefully considered, and were passed as fair comment upon a matter of public importance; they were much milder than similar references to the failure of the Gleno dam which appeared in the *Engineer* of June 12th, 1925, and we may point out that the construction of dams is a civil engineering question, for which electrical engineers, whether in Italy or elsewhere, are not usually held responsible. We fail to see, therefore, why the Italian electrical associations should feel aggrieved by our references to hydraulic engineering.

We have communicated with our correspondent in Italy, and have ascertained that he had no intention whatever to cast any unfavourable reflection upon the ability or the general success of the large and highly-esteemed body of engineers engaged in the Italian electrical industry. Our correspondent's references were directed to the fact that, in times past, when the industry was still young, mistakes had been made in the construction of certain dams and reservoirs; and, far from reflecting upon the general conduct of the electrical industry, he pointed out that "the industry in Italy is showing signs of real progress." Attention was drawn to the unsuitable design, and eventual collapse, of the Gleno reservoir, in December, 1923, with a view to any similarly unfortunate collapse being obviated. Our correspondent particularly indicated that the Gleno accident was due to the fact that the dam had been built and put into use without the permission of the Ministry of Public Works, and, therefore, could not be regarded as an example of such constructions. In the "Memoria Tecnica—La Diga del Gleno"—drawn up and signed by the distinguished Italian engineers, Sigg. Ing. Prof. Mario Baroni; Luigi Kambo; Urbano Margoli, and Ugo Granzotto (dated April 15th, 1925), the authors clearly showed by inference that there had been marked progressive fissuring of the rock in the Gleno gorge, while, according to the reports issued by Sigg. Prof. Paolo Vinassa de Regny and Prof. Mario Felici, the type of the dam, apart from its actual form, "was ill-chosen." The object of our correspondent in Italy was to impress upon our readers the necessity of learning from experience, and in so doing he expressed the hope—and, indeed, the belief—that future hydroelectric dams built in Italy would be free from any such defects. There are other countries, including our own—as witness the disastrous accident that happened to the Dolgarrog Dam in North Carnarvonshire last November—where dams have burst; but no general condemnation of the engineering profession has either been expressed or considered in relation to such misfortunes. Nor was any such deduction to be drawn from the article by our correspondent in Italy regarding the Gleno accident.

We cherish too high an esteem for the achievements of the Italian nation, whether in art, science, or engineering, to be willing to cast upon it any aspersion, and we are glad to learn from Signor Sartori that out of 95 large reservoirs in Italy with high dams, only one (the Gleno) has failed.—EDS. ELEC. REV.]

High-pressure Cables.

In the debate on Capt. P. Dunsheath's recent I.E.E. paper, Mr. Emanueli, the engineer of the Pirelli Cable Co., of Milan, mentioned a cable working at 130,000 volts, alternating, which they have had in successful operation for some 18 months.

Questions of electrical transmission are likely to be prominent subjects for discussion during the next few months in this country, in view of the proposals which will be before Parliament. It may, therefore, be of interest to say that I have recently been in Milan, and while I was there Mr. Emanueli was good enough to spend nearly a whole day discussing dielectric principles as elucidated by work extending over many years in their fine laboratories, and in showing me how they have endeavoured to embody the principles in the design and construction of the above-mentioned cable.

Not only has a considerable experimental length of the cable been in operation as above stated, but some miles are in course of construction for two American power companies. The cable is, therefore, not merely an experimental *tour de force* for exhibition and advertising purposes—it is a serious piece of work already at the commercial stage.

Although it would be interesting, I do not feel at liberty to describe in detail what I saw and heard, but must leave that to the discretion of the Pirelli Co. itself. I may say, however, that the principles on which the design is based appear to me to be entirely in the right direction for high voltages and heavy transmission. As regards the embodiment of these principles, I would also like to express my admiration for the boldness, inventiveness, and attention to detail, which mark the construction of the cable itself, and the methods which have been worked out for its installation and operation. These have resulted in what I am confident will prove an important development in cable practice.

Cable of this type should place a new power in the hands of engineers who have to deal with distribution problems in large areas that are at all thickly settled.

G. L. Addenbrooke.

London, *February 1st*, 1926.

[An interesting paper by Mr. Emanueli is reproduced elsewhere in this issue.—EDS. ELEC. REV.]

Several letters have been received, too late for insertion in this issue.—EDS. ELEC. REV.

Business Notes.

Commercial and Industrial Developments, Business Changes, Trade Opportunities, New Publicity Literature, Liquidations and Failures.

"Electrical Review" Advertisement Competition.—We hope to be able to announce the result of our Advertisement Competition in the next issue of the ELECTRICAL REVIEW.

Change of Address.—MR. A. DE TURCKHEIM, the secretary, announces the removal of the following to 58, Abbey House, Victoria Street, Westminster, S.W.1, as from to-day, Friday, February 5th:—

The Tramways and Light Railways Association.
The Incorporated Association of Electric Power Companies.
The National Joint Industrial Council for the Electricity Supply Industry.

The telephone number in each case is: "Victoria 2110."

The British Industries Fair.—It is stated that there will be a special radio apparatus section at the London branch of the Fair, and that no fewer than 33 firms have booked space for their exhibits.

The Shannon Scheme Dispute Ended.—Official intimation has now been made by the Irish Labour Party of the "calling off" of the strike and boycott on the Shannon hydro-electric scheme in the Limerick area. At a recent meeting of the Athlone Urban Council, discussing the question of providing new retorts at the gasworks, the chairman remarked that the Shannon scheme would soon be completed and that there would then be no need for the retorts. A Labour member said that the Shannon scheme would not be completed for 10 years. The Council decided to incur the cost of new retorts.

An Industrial Lighting Chart.—For the use of electric lighting contractors and their customers, the Benjamin Electric, Ltd., has issued a chart indicating the correct types of fittings for use in the lighting of shops, factories, offices, &c. It is mounted on linen and measures about 18 in. by 2 ft.

British Interests in China.—A committee has been formed to study the political situation in China in the interests of British trade. Lord Southborough is the chairman, and the members are as follows:—Messrs. D. Landale and G. W. Swire (China Association); Sir H. Cunliffe-Owen and Col. O. C. Armstrong, D.S.O. (F.B.I.); Messrs. F. Anderson and S. Dodwell (London Chamber of Commerce); Mr. H. H. Holt (Chamber of Shipping); Sir N. J. Stabb (Hongkong and Shanghai Banking Corporation); Mr. L. N. Keefe and Lieut.-Gen. Sir G. Macdonogh (China Advisory Committee); Sir R. Waley Cohen (Asiatic Petroleum Co., Ltd.); and Major W. S. Nathan (Peking Syndicate). The secretary is Mr. W. V. Jenkins, of the Far Eastern section of the F.B.I. The Committee has offered its services to the Foreign Office, and Sir Austen Chamberlain states that the Government will be glad to avail itself of the offer.

Electric Water Heating in Ships.—Sir W. G. Armstrong, Whitworth & Co., Ltd., who recently placed an order with Messrs. Bastian & Allen for "Bastian" storage geysers for water-heating equipment in two ships being built at Walker Yard, Newcastle-on-Tyne, have now placed with the firm a repeat order for storage geysers for the water-heating equipment for two further ships.

A New Super-Power-Station for London.—The proposal of the North Metropolitan Electric Supply Co., to establish a power station on an existing site at Brimsdown, near Enfield, has now taken definite shape, and the contracts for the first section of the station of 40,000-kW capacity have been placed with the object of completing and operating the plant in a period of twelve months. The project first came under consideration in September last, when Capt. J. M. Donaldson, the chief engineer, invited two or three leading engineering concerns to discuss various proposals with him; this was followed by a request to draw up alternative schemes and to prepare estimates for his consideration. Regular conferences have been held, and throughout the negotiations Capt. Donaldson has personally supervised the engineering; the plant now in course of manufacture will conform to the most modern practice of power generation. As main contractor the Foundation Co., Ltd., has been selected, with International Combustion, Limited, as principal sub-contractor. The latter company has been awarded the whole of the contract covering steam generation and transmission, and the "Lopulco" system of powdered fuel firing is to be installed. Five boilers, each of 10,100 square feet heating surface, have been ordered, and are to be manufactured by Messrs. Babcock & Wilcox. Each of these boilers will be equipped with the "Lopulco" patent water screens and "Murray Usco" fin furnaces, which will increase the total heating surface of each boiler to 11,000 square feet. International Combustion, Ltd., has placed orders with Messrs. Howden's for the air preheating equipment, and for economisers and superheaters of the Foster type the contract has been placed with the Power Specialty Co. The plant will include the latest design of pulverising mills, each of fifteen tons per hour capacity, which with the rest of the equipment will be manufactured by International Combustion, Limited, at its own works at Barrow and Derby. This station when complete will be the largest in the London area operating entirely with pulverised fuel, and the results will be awaited with much interest.

Norwegian Ship Equipment.—A new undertaking for the construction of ship radio telegraph and telephone installations has been formed in Oslo by Mr. Lehmkukl, with Mr. Paul Ydalus, who was for a long time connected with the works of the French S.F.R. (Société Francaise Radio), as technical manager. The new firm has entered into an agreement with the French company for the use of its patents and types.

Social Events.—Messrs. Ferguson, Pailin, Ltd., held their annual staff party and dance at the firm's Social Institute Rooms on Saturday, January 23rd. The directors invited all the members of the staff to be present and to bring their friends. Two of the directors, Messrs. S. Ferguson and G. Pailin, presided. An original farcical comedy entitled "Broadcasting" was given by members of the staff. The cast was as follows:—Station director, and producer, Mr. George Pailin; Chief Engineer, Mr. R. Connard; Announcer, Mr. R. B. Willcock; Aunty Pon, Mr. J. Hammons; Uncle Wally, Mr. W. Grimshaw; Call Boy, Mr. J. Howarth. The News Bulletin, Children's Corner, and "Eve's Review," lent themselves admirably to burlesque, and much amusement was created as individual staff members were introduced in humorous, but good-natured terms. This item was followed by an entertainment introducing the "F.P. Follies," who sang popular choruses, accompanied by the F.P. Orchestra. Dancing occupied the remainder of the evening, in the course of which a huge Christmas cracker nearly 20 ft. long was opened, and a large number of toy balloons emerged from its interior.

The Greater London Division of the Electricity Supply Commercial Association held a successful dance at Cannon Street Hotel on January 26th. Over 400 members and friends were present and everybody gallantly danced through the evening to the last bar of the last waltz despite the mild weather. No doubt the excellence of the music provided by the orchestra was a determining factor. Innumerable novelties were distributed, and the social spirit displayed was a marked feature. The secretary, Mr. G. R. Smith, and those who assisted him in organising the event are to be congratulated for the excellent arrangements made, of which the catering was not the least appreciated.

Lead.—Messrs. James Forster & Co. state:—"According to Metal Exchange Statistics, the apparent consumption of lead in the U.K. during 1925 was 253,459 tons, an increase of about 33,000 tons over 1924, as against an increase of 30,000 tons in 1924 over 1923. Stocks of lead, however, on December 31st, 1925, are given as 5 tons, whereas various authorities estimate them at from 8,000 to 12,000 tons. Taking the average figure, this would reduce the increased consumption during 1925 to 23,000 tons over 1924, against an increased consumption of 30,000 tons in 1924 over 1923."

Local Exhibition.—Annfield Plain.—The Urban District Council is arranging to hold an exhibition in three of the houses which have been built under its auspices. These will have only one coal fire and will be equipped with an electric cooker, a calorifier for bath and kitchen use, and a wash-boiler. As the exhibition will coincide with the introduction of a special domestic tariff (6s. per month plus 1d. per kWh, provided that 4 kW of appliances, independent of lighting, are installed) good results are anticipated.

Extension of Southampton Docks.—At a recent meeting of the Southampton Harbour Board, Major Szlumper, assistant manager of the Southern Railway, said that his company proposed a radical alteration in the lay-out of the proposed new docks. Under the scheme the company would be able to increase the quayage from 10,000 to 17,000 sq. ft. A start would be made upon the work as soon as the latest proposals had been considered. A description of the electrical equipment of the docks was published in our issue of September 18th (p. 471), and it appears probable that a great deal of further plant will soon be required.

Trade Announcements.—Mr. G. Ellam has removed from 69, Corporation Street, to 37, Cannon Street, Manchester, and has been appointed selling agent for Lancashire, Yorkshire, and North Wales for the "Draka" wires and cables produced by Electric Cables, Ltd.

The telephone number of Messrs. R. O'Brien & Co., 66, Mosley Street, Manchester, has been changed to "Central 6486" (3 lines).

Mr. Alan Wright, Sentinel House, Southampton Row, W.C.1, has been appointed sole sales representative for Great Britain, Ireland, and export for Hazemeyer switchgear. He has sent us a pamphlet dealing with star-delta starters.

With reference to an announcement published in this column last week, Mr. Dryden, who has purchased the business of L. Weekes, Ltd., from the liquidator and receiver, has registered a new company under the title "L. Weekes (Luton), Ltd" (see our "New Companies" section to-day), which will be carried on with Mr. L. Weekes acting in the capacity of managing director.

We are informed that the "Ino" Guaranteed Lamp Co., Ltd., of 35, Aldermanbury, London, E.C.2, is preparing to open a factory in Southend-on-Sea for the manufacture of electric lamps and other electrical appliances.

The address of Philips Lamps, Ltd., is now 145, Charing Cross Road, W.C.2. Telephone: Regent 7731; telegrams, "Phillamps, Westcent, London."

The Electro-Mechanical Supplies, Ltd., of Coventry, is moving on February 9th to 44, Bayley Lane, Coventry.

Messrs. E. P. Allam & Co., Ltd., 107-109,, Gray's Inn Road, W.C.1, have been appointed sole agents for London and the South of England for Messrs. Wrights Motors, Ltd., of Halifax, for the sale of d.c. and a.c. electric motors and dynamos, of which they will hold a stock.

Catalogues and Lists.—The Jackson Electric Stove Co., Ltd., 143, Sloane Square, S.W.—A February calendar-blotter, illustrating the contruction of a new open-type protected boiling plate.

The British Thomson-Houston Co., Ltd., Mazda House, Newman Street, Oxford Street, W.—A folder containing illustrated details and prices of "X-ray" reflectors for shop-window lighting; also an illustrated folder dealing with the lighting of Peterborough Cathedral.

The Yorkshire Copper Works, Ltd., Leeds.—A pamphlet advertising copper tubes for hot and cold water.

Messrs. Ward & Goldstone, Ltd., Frederick Road, Pendleton, Manchester.—A comprehensive catalogue of electrical supplies, including switch- and fuse-gear, cables, insulators, &c.

The General Electric Co., Ltd., Magnet House, Kingsway, W.C.2.—The "Osram Bulletin" for January; also a mailing card advertising the company's conduit fittings and accessories.

Tok Switches, Ltd., Granville House, Arundel Street, W.C.2.—A blotter announcing the number of the company's stand at the forthcoming British Industries Fair, Birmingham.

Messrs. Ruston & Hornsby, Ltd., Lincoln.—Publication No. 4,439, containing a short history of the company and illustrations of its products.

Bankruptcy Proceedings.—W. G. Conway (trading as "Listron"), 88-90, Chancery Lane, W.C., radio component dealer.—The public examination of this debtor was held on January 27th before Mr. Registrar Coldridge, at the London Bankruptcy Court. He failed in November with liabilities £607, against assets valued at £313. In the course of his evidence the debtor stated that, having previously traded as a chemical merchant, he started a wireless business in November, 1924, and carried it on with success until March, 1925. In that month he entered into an arrangement with a firm to supply him with a bulk crystal, which he was to pack as "Listron" crystal, and re-deliver to them on agreed terms.

In order to carry through the arrangement, witness ordered a considerable quantity of boxes and increased his advertising, but the firm subsequently declined to take delivery of a quantity of the crystals. "Listron, Ltd.," was formed in June last to acquire his business as a going concern, but the company never functioned. He attributed his failure and insolvency to the slump in trade since March, 1925; to the failure of the customer to take delivery of the crystals; and to heavy advertising charges. The examination was concluded. The following are the principal creditors:—

	£		£
L. Harforth & Co.	46	Iliffe & Son	99
Midland Bank	46	Wireless Trader, Ltd.	34
H. Slade, Ltd.	34	Westminster Advertising Service	74
Warrilows, Ltd.	44	Wm. Sessions, Ltd.	24
Boxfoldia, Ltd.	36		

E. P. HIGGINS (Western Union Wireless Co.), 99, Regent Street, W.—Trustee, Mr. E. Parke, Official Receiver, Carey Street, W.C., released January 18th.

G. BONNET, electrical contractor, &c., 2A, Camden Road, N.W.—The first meeting of creditors was held on January 26th at the London Bankruptcy Court, when proofs of debt for £430 were tendered. The receiving order was made on January 12th upon a creditor's petition, and in the absence of any proposal the case was left in the hands of the Official Receiver to be wound up under an order for summary administration.

J. N. DAVENPORT and L. A. HACKETT (Davenport, Hackett and Co.), electrical engineers and contractors, 36, Spring Gardens and Albert Mills, Albert Street, Manchester.—First dividend of 2s. 6d. in £ payable February 12th at 21, Spring Gardens, Manchester.

G. H. DIXON, electrical contractor, 46, Market Place, Dewsbury.—Trustee, Mr. J. O. Morris, Official Receiver, 12, Duke Street, Bradford, released January 18th.

C. PEACOCK, electrical engineer, 51, Gillygate, York.—Trustee, Mr. D. S. Mackay, Official Receiver, Duncombe Place, York, released January 14th.

Company Liquidations.—GAS & ELECTRICAL SECURITIES, LTD., 14 & 16, Cockspur Street, W.—The statutory first meetings were held on January 26th, at Carey Street, W.C. The winding-up order was made on the petition of the Northern Exploration Co., Ltd., London Wall, E.C., returned as creditors for £16,000 in respect of calls on shares. The company was formed in February, 1923, with a nominal capital of £1,000, to invest funds in the purchase of securities of any kind and description in any part of the world. The accounts filed under the liquidation show total liabilities of £19,512 (unsecured £18,293), assets of £2,471, and a deficiency of £15,824 as regards contributories, the issued capital consisting only of three ordinary shares of £1 each. The liquidation was left in the hands of the Official Receiver.

EAGLE ELECTRICAL MANUFACTURING CO., LTD., 32, Charlotte Street, W.1, electrical and wireless manufacturers.—A meeting of creditors was held on January 27th. The liquidator of the company, Mr. E. H. Henry, said that one of the creditors obtained judgment some time ago and had sold the place up. Continuing, he said that a lot of work had been done in putting in wireless sets for different hospitals, and there were a number of orders for further contracts which, if they had been able to carry them out, would have been very profitable. As soon as the sheriff sold, namely, on December 23rd, the necessary resolution was passed for voluntary liquidation. According to an approximate statement of affairs the liabilities amounted to £1,093. The only assets were certain book debts amounting to £313, but the liquidator said that he did not think that these would realise more than £75. From that amount had to be deducted preferential creditors amounting to £68, leaving net assets of £7. The company was incorporated in July, 1924, with a nominal capital of £1,500. A resolution was passed confirming the appointment of the present liquidator.

The following are creditors:—

	£		£
Chadwick Healey	279	Lighting, Heating & Glass Co.	58
E. H. Henry	23	Mullard Radio Valve Co., Ltd.	157
Brown, S. G., Ltd.	67	Siemens Bros. & Co., Ltd. ...	60

RE-ECHO RADIO CO., LTD.—Winding up voluntarily. Liquidator, Mr. C. H. Whatley, 6-7, Charing Cross Chambers, Duke Street, Adelphi, W.C. Meeting of creditors at the liquidator's offices on February 10th. Particulars of claims to the liquidator by February 27th.

Calendar and Diary. — We have received from the HART MANUFACTURING CO., 76 and 77, Rochester Row, S.W.1, a 1926 diary, comprising monthly date slips upon a wall card illustrating "Diamond H" switches.

THE EDISON SWAN ELECTRIC CO., LTD., have sent us a pocket diary neatly bound in dark red leather, with a week to each double page.

Private Arrangements.—I. M. B. OLIPHANT, E. R. WHITFORD, and C. C. JOHNSON, trading as the Campbell Radio Store, 2, St. Catharine's Road, Southbourne, Bournemouth.—A meeting of creditors was held on January 27th, at the offices of Mr. Parkin S. Booth, Holborn Viaduct, E.C. The statement of affairs of the joint estate showed liabilities of £1,389 and net assets of £1,185, leaving a deficiency of £204. The separate estate of E. R. Whitford showed liabilities of £9, with assets of £35. The separate estate of C. C. Johnson showed liabilities of £166 and no assets, and that of I. M. B. Oliphant disclosed liabilities of £312 against assets of £977, a surplus of £665. Mr. Booth reported that the business was commenced by C. C. Johnson in September, 1924, without capital. In November of the same year Whitford joined the business, bringing in £250. The third partner joined the business in May, 1925, and introduced £250 in cash. A deed of partnership was entered into, under which each of the partners was credited with a capital of £250, and it was arranged that they should each draw equal amounts. In July last Mr. Whitford, senior, advanced £300 to the partnership, for which he was still a creditor. In August Oliphant brought in an additional £222 as a loan. Approximate accounts to October 16th last showed a net loss of £400. Efforts had been made to obtain further capital, but without success. Whitford desired to leave the partnership, and a deed of dissolution was prepared, but had not been executed. The deficiency was accounted for by the writing down of the assets and the loss on trading. Creditors had been pressing, but no proceedings had been commenced. There was no offer, and a deed had been executed to protect the assets. A resolution was passed in favour of the matter being dealt with under a deed of assignment with Mr. Booth as trustee, whilst a committee was nominated, consisting of Messrs. C. Latham (Wireless and Radio Trades Guardian Association), W. A. J. Osborne (British Traders' Association), and E. H. Hawkins (Poppleton, Appleby & Hawkins).

The following are creditors:—

	£		£
British Thomson-Houston Co., Ltd.	23	Marshall & Co.	41
C. A. C. Radio, Ltd.	22	Motor Macs, Ltd.	45
Evers, H. P., & Co.	44	Richards, G. T.	23
General Battery Co., Ltd. ...	75	Ward & Goldstone, Ltd.	45
Houghton Butcher (Gt. Britain)	352	Summit Manufacturing Co., Ltd.	146
Hewitt, H.	27	Sel-Ezi Wireless Supply Co., Ltd.	20

Dissolution of Partnership.—GLOVER BROS., electrical engineers and general machinists, Windsor Street, Coventry.—Mr. H. J. Glover and Mr. H. W. Glover have dissolved partnership. Mr. H. W. Glover will attend to debts and continue the business.

An Exhibition of Business Machines.—The International Business Machines Co., Ltd., and the International Time Recording Co., Ltd., have recently opened new showrooms and offices at 112, Strand, W.C.2. Here are displayed a number of aids to business efficiency. A large number of time-recorders for offices and factories are shown, as well as the Time Recording Co.'s system of synchronised electric clocks. One useful device of an electrical nature which is exhibited is a door recorder. This is attached to a door lock and at the same time is connected in an electric-clock circuit. A set of keys, each allotted to a particular individual, is provided, and when the door is locked or unlocked the time is recorded as well as an identification of the person concerned. It is especially applicable to strong rooms, but it has many other uses. Examples of "Dayton" food-preparing machines are on view. All of these are compactly built, having the driving motor incorporated in them. The range includes coffee grinders and sausage machines. A further useful device is the "Ticketograph" system, by means of which the costing of piece work is greatly simplified.

Book Notices.—"The Electrical Educator."—In the parts four to nine of this work, the prospectus which we referred to in our issue of October 16th last in connection with the first two parts has been continued and extended. Although the work in the main is a practical treatise on electrical engineering, it is so written as to make a pleasing departure from the usual text-book style, each part touching on several phases of the subject as part contributions or lessons, with the introduction of special articles by distinguished engineers on subjects of general electrical and industrial interest. Among the many eminent contributors are Messrs. A. P. M. Fleming, C.B.E., and John Bruce, A.M.I.E.E., Sir Charles Bright, F.R.S.E., Messrs. D. N. Dunlop, and H. Dickinson, M.Inst.C.E. The work is being published by Sir Isaac Pitman & Sons, Ltd., in 30 fortnightly parts (at 1s. 3d. each).

Revised Indian Import Duties.—The *Board of Trade Journal*, dated January 28th, contains schedules of the revised import and export duties instituted by the Government of India as from January 1st. Among the articles affected by the revision are electrical control gear and transmission gear (15 per cent. *ad valorem*); telegraphic instruments, apparatus and parts imported for or by a railway company (10 per cent. *ad valorem*); tramcars (15 per cent.); tramway track material (10 per cent.); certain prime movers and other machinery (2½ per cent.); and electrical wires and cables and transmission system fittings and parts (2½ per cent.).

Guarding Against Fraud.—Although but recently instituted, the scheme of the Federation of British Industries for the exchange of credit information has already achieved a large measure of success. Over 1,500 firms are participating, and the service covers every important trade in the country. The number of names of undesirable traders which have been notified to participants has reached over 800, and the total is increasing at the rate of 80 per week; 40 per cent. of the defaulters are of foreign origin. The working of the scheme has disclosed a number of methods adopted by these fraudulent traders. The commonest type of fraud is a declaration of inability to pay, all assets having previously been made over to the defaulter's wife or other near relative. The next most prevalent type is the long firm fraud, in which goods are sold to untraceable persons, and a number of aliases are employed. Another common method of fraud is a refusal to accept delivery after goods have been sent to a foreign market; they are afterwards bought at "knock-down" prices at public auction. Sometimes expensive samples are obtained from firms and sold. A common trick is to give two or three small orders, which are paid for promptly, followed by a large order for which the money cannot be obtained; and sometimes the disappearance of the defaulter is involved. A method of fraud commonly met with among foreign firms is the obtaining of a large order for goods by a trick; there are a number of ways in which this can be done. Some purchasers will, months, or years, after payment is due, question the quality of goods sent to them. Finally, it sometimes happens that an agent will double an order for a client, and when he finds that he is unable to dispose of the extra goods, he will repudiate the transaction and default.

E.D.A. Activities.—The British Electrical Development Association has sent us a copy of its sixth instalment of publicity matter which is appearing in the national Press. These advertisements are specially designed for the class of paper in which they are to appear; they are excellent examples of their kind, and should be productive of good results.

Siamese Electrical Imports.—A report upon the commercial situation in Siam during the year ended March 31st, 1925, by Mr. E. G. Sebastian, lately Acting Consul-General at Bangkok, states that the value of imported electrical goods and apparatus declined from 1,150,507 ticals to 796,294 ticals (£1=10.89 ticals). The value of the United Kingdom's share, however, rose to 350,000 ticals, and this country thus recovered the first place from Germany, whose contribution was 130,000 ticals, as compared with 328,343 ticals in 1923-24. It is stated that Denmark has almost dropped out of the market.

The Position of the Wireless Trade.—In the course of an article appearing in the *Wireless Trader* under the title, "The Year—What Will it Become?" the writer says:—"Then, again, we have a complete unheaval of the leading manufacturers and trade association. The trader does not know exactly what this is going to mean to him, but in a half-hope that it will mean better discounts, he holds off buying at a time of the year when he should put forth all his energies.

"Surely, Mr. Trader, the veriest novice in economics can work out the problem for himself? The manufacturer is not so foolish as to increase the price of his goods to the public, and, with a few exceptions, his profit is already so small that to give away any more of it would be running a serious risk of disaster; while, with the increases in the prices of various raw materials, such as ebonite, he is not likely to be saving much in production costs.

"How, then, is he going to find you that extra large lump of discount which you hope is going to appear as a result of a temporary break in his ranks? Obviously, the only way in which you can possibly hope to increase your discount is to send the manufacturer more orders, and thus lower his overhead charges through increased production. Therefore, if you are looking for an increase in discounts, you should be pushing sales for all you are worth, so that you may increase your orders."

Russian Orders for Germany.—It is reported from Dusseldorf that a further contract has been entered into between the Donugol (South Russian Coal Trust) and various German firms for the establishment of power stations at an expenditure of £750,000. The participating firms are the A.E.G., Siemens & Halske, Felten & Guilleaume, and two mechanical engineering works. Further negotiations with the same group are said to be still pending for other works of a similar kind.

Coal, not Electricity, the Panacea.—Addressing the Glasgow Chamber of Commerce on January 26th, Sir Adam Nimmo said that the only sound and stable policy for the industries of this country was the production of increasing quantities of coal. Unification, electrification, carbonisation, and nationalisation of royalties were no remedies for our troubles.

Australian Companies.—Installation and Equipment, Ltd., is the name of a company recently formed in Sydney, with a capital of £10,000, to carry on business as electrical engineers and contractors, &c.

The name of the Western Electric Co. (Australia), Ltd., has been changed to Standard Telephones and Cables (Australia), Ltd.

The British Electric Transformer Co. (Australia) Pty., Ltd., has been formed in Melbourne with a capital of £10,000 to carry on business as electrical engineers, ironfounders, &c.

The P. & B. Battery Co., Ltd. (capital £5,000), has been formed in Melbourne for dealing in and manufacturing electrical machinery, &c.

South African Electrical Imports.—According to the *Board of Trade Journal*, the imports of electric cable and wire into South Africa during the first seven months of 1925 were valued at £368,119.

New All-Electric House and Showroom.—The Rotherham Corporation has approved a proposal by the electrical engineer (Mr. E. Cross) to convert premises in Rawmarsh Road, now utilised by the department as a stores, into an all-electric home for demonstration purposes. Mr. Cross states that the cost of the conversion will be inconsiderable, and that the work can be carried out by his staff. He proposes to furnish the premises for demonstration purposes as a living room, sitting room, scullery, bedroom, and bathroom, and to utilise a large room adjoining as a showroom for domestic electrical appliances.

The Building Trades Exhibition.—It is announced that the Lord Mayor of London will open the Building Trades Exhibition at Olympia on April 14th.

United States Radio Exports.—Department of Commerce statistics show that radio goods valued at $8,936,565 were exported during the first 11 months of 1925, as compared with $4,950,746 during the same period of 1924. Radio exports now constitute 12 per cent. of the total foreign electrical trade of the United States.—*Reuter's Trade Service* (Washington).

Unemployment.—There was a fall of 5,503 in the number of registered unemployed persons during the week ended January 18th, the total at that date being 1,215,900. The number at the equivalent date last year was 1,269,733.

Engineering Employés' Wages.—A joint conference of representatives of employers and trade unions connected with the engineering industry, held on January 28th, broke up without reaching any agreement. The negotiations were commenced in June, 1924, upon an application from the men for a general increase in wages of 20s. per week. The employers offered an increase of 2s. per week in the bonus if the men would agree to an extension of the working week from 47 to 50 hours and other modifications, but this was not accepted. At the conclusion of the conference Mr. J. T. Brownlie, of the Amalgamated Engineering Union, said that the unions considered themselves free to take what action they thought fit. The employers replied, through Sir Allan Smith, that they thought insufficient consideration had been given to the condition of the industry as outlined in their statement. It is thought that the unions may now resort to negotiation by districts having failed to secure a national increase. Part of the proceedings of the conference consisted of the presentation of a report relating to the possibility of bringing conditions in the Continental engineering industries to the same level as our own. Italy, Germany and Belgium, in response to letters from the Minister of Labour, have signified their willingness to confer on the matter, but no reply has yet been received from France.

According to the *Financial Times*, trade union leaders in the Newcastle engineering industry state that the deadlock was due to the interpretation of the position by the employers—namely, that so long as the national negotiations were pending, no other question affecting wages could be considered by them. It is claimed on the men's side that the engineering trade is in a moderately good condition and that the state of it in certain branches is such as to warrant an immediate advance in wages. The executive representatives therefore decided in the interests of their members that where an advance in wages was warranted it was necessary to terminate the negotiations in order to allow claims from members in their respective districts to be considered without reference to the national procedure as interpreted by the employers.

New Italian Companies.—Among the electricity supply undertakings recently formed in Italy are La Società Cadorina di Elettricita, organised in Genoa with a capital of one million lire; La Società "La Luce," of Trebisacce (Castrovillari), 80,000 lire; La Società Imprese di Elettricità U. Sampietro, Trento, 1,500,000 lire; and La Società Elettrica Carnica, Udine, 1,600,000 lire.

Electrical Trades Commercial Travellers' Association.—A well-attended social evening was held on January 22nd, at the E.L.M.A. Rooms, by the Association, when a lecture was given by Mr. W. E. Bush. Refreshments were provided during the evening, and these were followed by a demonstration of "Lighting in the Home" by Miss Florence Hodge. By means of a revolving stage, the different lighting which should be used for each room throughout the house was shown in its natural surroundings, and was, in each case, contrasted with the unsuitable types of lighting which are so often seen. Mr. E. A. Joyce proposed a vote of thanks to Mr. W. E. Bush and Miss Florence Hodge, and Mr. Bush replied.

Building Exhibition at Edinburgh.—A Housing and Building Exhibition is to be held in Edinburgh from February 10th to 20th. Among the exhibitors is the Yorkshire Copper Works, Ltd., which is displaying examples of its light-gauge copper tubes.
